W431	Savahanna O'Toole	SanDiego350	<p>Environmental justice must be embedded in our mobility in San Diego. Therefore, I ask that the 10 Big Moves to Transportation Justice be included in the 2021 Regional Transportation Plan. I call for an environmental justice centered RTP to ensure the projects included in the RTP will prioritize environmental justice (EJ) communities identified by CalEnviroScreen (CES) by listing projects that will directly benefit EJ communities, outlining immediate benefits via projects that will be implemented by 2025 in EJ communities, and making all public communication easy to understand by the public in order to promote meaningful engagement. Therefore, in the RTP, I ask that an equity specific project list be included in Appendix A: Transportation Projects, Programs, and Phasing document. I call for an improvement in the bus system now that is fast, frequent, reliable, and accessible through increasing frequency on popular lines, especially overcrowded ones. Therefore, I call for more clarity in Appendix A: Transportation Projects, Programs, and Phasing that provides a list of specific improvements to the bus system. I call for increased funding for the planning, environmental review, engineering, and capital for the additional Blue Line track that allows express, 24-hour service, and additional frequency enhancements. The information for the Blue Line needs to be clarified; it is unclear if the double/third tracking included in Appendix A refers to an additional track that will provide express connectivity from the border to downtown San Diego. I call for a 24-hour service by 2025 on popular transit routes to connect late night and early morning workers to their job. Therefore, the information in the RTP needs to be clarified; the language in both Appendix A and Chapter 2 should specifically call for 24 hr service on popular transit routes and present a clear implementation schedule. I call for the funding of the planning, environmental review, engineering, and capital for the Purple Line as a rail line that connects EJ communities in Central City Heights and South Bay to Sorrento Valley. According to SANDAG staff, the alignment includes City Heights in the 2050 RTP with a 2035 implementation. However, it should be listed in the document to demonstrate that project phasing prioritizes central City Heights and the South Bay region, and a 2035 completion I call for no-cost transit passes for all youth 24 years old and under in order to ensure generations of lifelong transit riders and encourage significant mode shift. Further, I ask that it be accelerated for a 2035 implementation rather than the current delayed plan to implement in 2027. I call for an electrified bus fleet by 2030. Fund the implementation of California's Innovative Clean Transit rule to accelerate the electrification of the bus fleet ten years before mandated by the California Air Resources Board. We cannot afford to wait 20 years to reduce GHGs. Therefore, I ask that the transition to zero-emission buses be accelerated for a 2030 completion with the support of recently approved state and federal funding sources. I call for the funding of to protect vulnerable communities living near transit corridors by anti-displacement efforts developing an anti-displacement strategy that includes affordable/low-income housing and preservation of naturally occurring existing affordable housing, community ownership, and tenant protections. Therefore, I request an update on the status of the anti-displacement study. I call for the development of a bathroom access plan and providing MTS with funding for a clear and accessible bathroom network open at all major transit stations. It is unclear if a bathroom network is included in the capital operations budgets. I call for the funding of the planning and implementation of a transit emergency response strategy to provide safety particularly to EJ communities during community-wide emergencies. Currently, this is not included in the RTP.</p>	<p>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under. The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive</p>

ID	Commentor Name	Agency	Comment	Response
				program promotes equity and addresses gentrification, displacement, and other issues. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.
W432	Scott Ankers	N/A	I feel that the regional plan emphasizes huge, transformational capitalization projects requiring significant money, resources and time/effort. Alternatively, I believe there is an opportunity to keep San Diego moving and reduce travel times without huge capital expenditure or time to fruition. I've previously heard and read in SANDAG comments that if we could just get 10% of cars off the road, traffic would be significantly reduced...and during this pandemic, I've personally experienced this benefit first-hand!!! Why doesn't the broader term plan incentivize this continuation of less cars on the road by providing incentives to keep more cars off the road - for example, tax breaks to work from home, tax breaks for companies to support 1 work from home day a week, carpooling incentives, a stay at home day by license plate number, etc etc. Surely there are ways to incentivize less cars on the road combined with major construction projects. Additionally, a personal pain-point for me in San Diego County is the total lack of Permissive Left-Turns. Whenever I drive throughout the country outside of San Diego, I enjoy the freedom to turn left at an intersection whenever there isn't on-coming traffic. This greatly reduces travel time and, I presume, reduces traffic accidents at intersections where drivers cram to make turns in narrow time windows. I can imagine on my daily commute, I'd save 5 mins not having to wait at every protected left turn when there are no cars coming...it's especially infuriating at intersections which there's barely any traffic regularly... 5 mins a day would potentially save my over 24hrs in the car a year!!! Again, hopefully this would not require significant capital expenditure to update with current traffic signals, etc. Another small step that could have significant impact and improvement upon travel time to keep San Diego moving!!!	The Regional Plan includes a host of solutions to reduce traffic congestion but with projected growth in population, housing, and jobs, incentives for telecommuting and carpooling are simply not enough to keep pace with or reduce congestion. However, the Regional Plan advances many services early on that provide real quality transit solutions for the region. In terms of the permissive left turns, while falling within the purview of the local cities, the Regional Plan does include near-term (2025) investments in smart intersections throughout the region to reduce unnecessary delay and save people time.
W433	Sean Richards		Build sidewalks on the north and south facing slopes of Mission Valley to facilitate the north/south commute for bikes. Few will ride bikes down and out of MV on roads as a way to commute to work.	As an early action out of the 2021 Regional Plan, SANDAG will be developing a new Active Transportation Plan. The plan will take a fresh look at the network and the options to make it safe and comfortable to use active transportation.  Your comment was forwarded to the City of San Diego.
W434	Sebastian Ladron de Guevara	San Diego mts	I when getting pronto card in mail?	Please contact the Metropolitan Transit System at (619) 595-5636 or <a href="https://www.sdmts.com/fares-passes/pronto-fare-system">https://www.sdmts.com/fares-passes/pronto-fare-system</a> to receive information about your Pronto card.
W435	Simone Arias	Mid-City Can	We urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth (ages 24 and under) receive priority when transit fare subsidies are allocated.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
W436	Stephen Lees		You can't do this, you are not competent enough. You can't even take care of the roads as it is. When you can balance the books and maintain the infrastructure, without lying (we haven't forgotten the scandal from 2017- you have not got our trust) and restored credibility with existing projects, come back. I refuse to pay for you to lie and fail at my expense, again.	Thank you for your comment.
W437	Steve Dow	self	I strongly urge that this plan be updated to be much more aggressive with solar power development. Such solar systems can and should absolutely be viewed as part of a modern transportation network. A network of solar power / battery systems can disconnect from the grid when necessary and	Reducing emissions from all sectors is critical for the state to meet its goal of "carbon neutrality" by 2045. Implementing the 2021 Regional Plan, while also facilitating the development and implementation of local Climate Action Plans (CAPs) across our region, will help everyone—the State, SANDAG, cities, and other public agencies—achieve their

Draft 2021 Regional Plan Responses to Comments – Website Sourced

			<p>provide a stand-alone back-up system in the event of grid failure similar to what occurred in Texas several months ago.</p> <p>I recommend that this plan include detailed plans for solar cell shade structures at nearly every sidewalk and/or right-of-way possible in the SANDAG region. If the infrastructure is developed appropriately, such a system will start providing an immediate payback to our region. Solar-powered batteries can be strategically located (and made mobile as well) to charge electric vehicle stations (and/or buildings and communities). Systems could even be set in locations that might specifically benefit disadvantaged communities today.</p> <p>We need leaders who think BIG on this issue. Renewable energy can help solve many more problems than just climate change, but we need to think MUCH more aggressively than we have to date... and we need leaders who will champion this and act.</p> <p>The Rancho Bernardo Community Council sent a letter to Councilmember Mark Kersey in 2020 (and the letter was forwarded in 2021 to Councilmember Marni von Wilpert) that recommends area near the Rancho Bernardo Community Park for a test case of such solar / battery systems described above. Background on the idea and likely benefits of it are included in attachments to that letter.</p> <p>PLEASE INCLUDE THIS AS PART OF THIS PLAN.</p>	<p>climate goals. The Regional Plan does not include details on project designs, but SANDAG looks forward to partnering with local jurisdictions and others as it implements the Plan. Advancing renewable energy, including solar power, will be key to a carbon neutral future.</p>
W438	Steve Howie		<p>I am strongly against the overall vision for San Diego's transportation plan. I am not a proponent of public transportation, nor do I believe that it will be used by the majority of San Diegans. Taxing citizens to drive to try to stop people from driving cars is insane and does not have any place in San Diego. I have lived here all of my life. Please take your socialist "central planning" reimagined transportation plan somewhere else. The usage tax is a horrible idea and I pray that the voters will not succumb to this pie in the sky plan. How about you try fixing the roads - we don't need 163 billion dollars to do that!</p>	<p>Thank you for your comment.</p>
W439	Steve Sampiere		<p>Hi, I've been a cyclist for over 50 years of which just under 40 of those years have been in San Diego County. I participate in all forms of cycling: Sport(fast) Cycling, Commuting (Solana Beach to Downtown), and ebike for shopping and errands. I rarely use a car any longer except for out of region trips. I've seen the development of bike lanes go horribly wrong. In an effort to make cycling "safe" protected bike lanes have done the opposite in my opinion. They "trap" the cyclist within a narrow and often poorly maintained path that creates a very unsafe method of travel for a cyclist and they are extremely expensive to build and once built have virtually no flexibility for change. In my opinion, a safer and more efficient (cost and movement) is non-protected bikelanes with a buffer such as the newly constructed southbound bike lane adjacent to Torrey Pines Reserve. All bike lanes should be constructed this way. This portion of the bike lane has the following positive attributes: 1. two lanes in same direction which allows slower and faster cyclist (and pedestrians) to easily and safely co-exist; 2. A buffer between the cycle and auto lanes;3. Given there is no curb between the cycle and auto lanes it provides additional safety by allowing a cyclist to travers outside of the cycle lane in the event of slower or stopped cyclists, pedestrians, and/or unsafe obstacles. In addition it is lower cost and easier/faster to build/maintain. I feel very safe on this particular path as compared to the recently built path on the Coast Highway in Cardiff/Encinitas. I now avoid that stretch of road as much as possible and when I do use it I generally stay in the sharrows as there is rampant misuse of the protect lane and it often has excessive sand and glass. When using the Sharrows I'm constantly close passed by autos exceeding the 35mph speed limit. When driving that stretch I'm often buzzed by autos vastly exceeding the 35mph speed limit. I'm happy to share my thoughts further should you like to meet. Thanks for listening.</p>	<p>SANDAG follows national and international best practices in bikeway design to create safe facilities for users of all ages and abilities. Multiple studies show that most people feel safer in protected bikeways, and when well designed, they are safer than any other type of bike facility. The focus of our efforts is on people who may be "interested but concerned" in riding a bike alone or with family. For those who do not feel comfortable riding in protected bikeways, the California Vehicle Code allows people to bike in the roadway with traffic. While protected bikeways are a great solution in many cases, we know they are not always the best solution. Every project goes through a detailed and context sensitive design process which results in decisions regarding the best facility, which may include protected bikeways, buffered bikeways, shared use paths, or shared streets with significant traffic calming elements. The Regional Plan also includes funding for upgrading existing bikeways that may not meet current best practices in maintenance or bikeway design.</p>
W440	Steven Smith	Unaffiliated with any organization.	<p>My wife and I are senior citizens living in Fallbrook. We do not use, have not used, and have no desire to use public transportation to travel anywhere within the County of San Diego. We believe what will serve our interests the best it to have well maintained roads and other infrastructure with sufficient capacity along with programs and technology that best facilitates using one's personal vehicle to travel to different locations within San Diego County with the fewest delays possible. We would especially hope that funding is spent fairly to provide benefits to the overwhelming vast majority of San Diego County residents that prefer to drive their own vehicles to wherever they want to go. The I-15 and I-5 corridors along with Highways 76 and 78</p>	<p>The 2021 Regional Plan includes a managed lanes network proposed for I-15, I-5, SR 76 and supporting managed lane connectors, included in Appendix A. The Plan includes 4 managed lanes on SR 76, 4 managed lanes on I-5, and 3 managed lanes on I-15 north of Valley Parkway. In addition, technology improvements are planned for all freeway corridors and supporting arterials.</p>

			are very important to North County residents and should absolutely get a fair and equitable share of any funding and project focus.	
W441	Steven Steppe	EWMC San Diego	In order for the plans to give the maximum benefits back to the communities entry level positions need to be offered to the communities in construction of all the projects. A project labor agreement that requires inclusion of lower income communities would bring money back into those communities. Writing in apprenticeship starting positions open to people from low income communities as a requirement would lift and support people while providing opportunities for advancement into the middle class. Not goals but requirements from every trade classification. They have been proven to work in other cities.	In an effort to invest in our region's underserved communities, one initiative SANDAG is currently working on is the development of a Community Benefits Agreement. In partnership with the San Diego County Building and Construction Trades Council, SANDAG received state funding through SB 1 to establish a 24-month pre-apprenticeship program to provide individuals throughout the San Diego region with resources and training for a career in construction. On July 23rd, 2021, SANDAG's Board of Directors voted to start negotiations with the San Diego County Building and Construction Trades Council to begin developing this program.
W442	Suki Glenn		I support the 10 Transit Lifelines be included in the Regional Plan. It is important to make sure all San Diegans have the opportunity to use affordable public transportation.	Many of the 10 Transit Lifelines are projects/programs in the 2021 Regional Plan. Many will require interinstitutional collaboration with other agencies. Nevertheless, they are or will be noted in the final draft, Appendix G. SANDAG is diligently working towards addressing the needs of disadvantaged and underserved communities.
W443	Sunny Soto	Sunny street outreach	For more marginalized communities and even age groups the access to a bike that can ride over big hills, as most of the city is, aren't affordable. Ride shares add up quickly also and you MUST have a bank acct and know how to guide apps to do this. For scooters those same technology and bank rules apply plus I know I don't have to touch on the safety of those scooters. The city hospitals see soooo many injuries and most people don't have the healthcare or access to good health coverage. Public transportation takes a long time to get places which is hard for scheduling as well.	<p>The deployment of Flexible Fleets such as e-bikes, shuttles, or ridesharing is envisioned as part of the 2021 Regional Plan to provide convenient and affordable options in different communities. SANDAG is developing a Flexible Fleet Implementation Strategic Plan to identify near-term opportunities for Flexible Fleet pilots that support mobility, equity, and sustainability goals.</p> <p>Ensuring there are options for all people to access Flexible Fleets is an important component of the 2021 Regional Plan. This includes designing services that enable all people to easily reserve a ride such as a call center, cash payment options, or trip planning kiosks in Mobility Hubs. As Flexible Fleet pilots are launched in the region, services will be designed to be inclusive and equitable for all.</p>
W444	Susan Durbin	Samahah Health Clinic	I worked at the Granger Clinic. One of the main complains of our patients is that there is no bus stop by or close to the clinic.	<p>While there are no proposed new fixed-transit routes that go to the Granger Clinic, Flexible Fleet solutions will be able to help provide that first and last mile connection from the nearby transit stations in the area.</p> <p>Your comment has been forwarded to San Diego Metropolitan Transit System (MTS).</p>
W445	Susan Escoffier	County Resident	This 2021 Regional Plan will not work for the unincorporated communities of San Diego county. The burden of the costs will be placed upon the county residents who are least able to afford these TAXES! We live in the outer areas of the county because we cannot afford housing more centrally located, we are retired on fixed incomes, we are lower income earning employees, etc. You are touting equity in this plan when in fact it is causing greater disharmony and dissention and placing greater hardship on a significant portion of the San Diego county population. Please do your due diligence in intentionally studying ALL affected communities in your "Plan".	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p>

**Draft 2021 Regional Plan Responses to Comments – Website Sourced**

ID	Commentor Name	Agency	Comment	Response
W446	Susan Oliver		I would like to be certain that SANDAG is working towards providing growth/changes that reflect what the citizens want; not want a small group of people think they should want. With that in mind, we should be looking at more roads and less building. At some point we need to admit that we can't support any more people. We don't have enough water or room. Please consider making changes to reduce growth!!	The Regional Plan aligns with population growth projections for the San Diego region developed by the California Department of Finance.
W447	Susan Wilding		How do you plan to charge people who do not live in CA and drive their personal vehicle in CA. Out of state truckers. AZ, NV, UT, CO, OR. And military people?	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues.</p> <p>SANDAG will coordinate with other Metropolitan Planning Organizations in California along with the State Department of Transportation to integrate the selection of technology, collection methods, and account management. As these implementation mechanisms are determined, SANDAG will develop strategies for out of State individuals and commerce that are using roads in the San Diego region.</p>
W448	Tamara Petersson		I commend SANDAG for scrapping the former plans and starting anew with the 2021 Regional Plan. The current plan is well thought-out and prepares San Diego for the next several years. There are so many positive possibilities!	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W449	Teresa Hernandez	Ucsd	I'm UCSD staff and my working hours are from 4:00a.m. at 12:30p.m., I want to know if the trolley schedule will be accessible so that we can use this transport? Teresa H.	<p>The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p>
W450	Theodore Cheung		Hi thank you for all the hard work you all are doing, I was wondering if SANDAG is studying the feasibility of Aerial cable/gondola transit considering that land is developed on mesa tops and that there's a lack of connections between mesas, especially between mesas around the Los Penasquitos Preserve in the North-South directions and in Sorrento Valley.	Gondolas had been considered in past versions of the plan but were replaced with additional Next Generation Rapid routes. MTS and SANDAG still continue to keep an eye on this mode and may reconsider it in future plans.
W451	Theodore Cheung		Additionally, considering the amount of tunnels to support the commuter rail projects, will SANDAG own a boring tunnel machine or will it be a contracted machine?	Construction methods will be determined during final design of the projects. It is unknown at this time what time of tunnels will be constructed and what equipment will be needed.
W452	Theodore Cheung		As for the commuter stations, will there be varying levels of commuter train service? Specifically, will there be center passing tracks in the stations that will allow express trains to bypass trains stationed at local serviced stations? This would allow more transit service flexibility for our region. Thanks! Ted	Yes, passing tracks are envisioned as part of the commuter rail network.
W453	Theresa Lane	Sunrise Movement	<p>Every San Diegan deserves access to high-quality transportation and economic mobility, especially young people ages 24 and under and seniors. We urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under receive priority when Transit Fare Subsidies are allocated.</p> <p>Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region's equitable economic recovery. No-cost transit passes for all youth ages 24 and under ensures generations of lifelong transit riders are part of our long-term strategy to build a greener and equitable San Diego. No-cost transit passes will connect youth to school, work, medical care, internships, and other early-career opportunities. Programs like these exist with great success in Alameda County, Boston, San Francisco, and most recently Sacramento and Los Angeles.</p>	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.

			I urge the board to take bold action to build a greener, healthier, prosperous, and just future in San Diego. Please amend the Plan to include Youth Opportunity passes as a priority. Thank you.	
W454	Thi Vo		We are urging SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth (ages 24 and under) receive priority when transit fare subsidies are allocated.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.
W455	Thomas Lichterman	Oceanside Bicycle and Pedestrian Committee	<p>The following are initial general comments regarding the Active Transportation Project listings in Appendix A.11 - North County:</p> <ol style="list-style-type: none"> <li>1. For each Active Transportation project listed in the table, please provide a sufficient project description so that the reader can understand what the project is and what city(s) it is located in.</li> <li>2. For each Active Transportation project listed in the table, please provide the geographic project limits in terms a lay-person will understand, such as nearest major roadway intersection or major landmark.</li> <li>3. For each Active Transportation project listed in the table, please indicate which project phases (e.g., planning, preliminary engineering, final design, construction, etc.) is funded by the cost estimate shown.</li> <li>4. Please correct the paragraph below - other pages of the Regional Plan website state comments can be submitted through August 6, not July 30.</li> </ol>	<p>1) As identified in Appendix L, these projects were approved by the SANDAG Board of Directors In 2010 with the development of a comprehensive regional bike network - Riding to 2050: The San Diego Regional Bike Plan. <a href="https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail</a> and again these Coastal Rail Trail segments were identified as a priority project in 2013 via the Bike Early Action Program (EAP) <a href="https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail</a></p> <p>2) Please see full Network Explorer here <a href="https://sandag.maps.arcgis.com/apps/Cascade/index.html?appid=897af882e8c14b1e996c33e48bc15347">https://sandag.maps.arcgis.com/apps/Cascade/index.html?appid=897af882e8c14b1e996c33e48bc15347</a> or specifically the “Adopted Regional Bike Network” layer in the standalone webmap from that Explorer linked here <a href="https://sandag.maps.arcgis.com/apps/webappviewer/index.html?id=11c84c1530084748a7fa410920370218">https://sandag.maps.arcgis.com/apps/webappviewer/index.html?id=11c84c1530084748a7fa410920370218</a></p> <p>3) If the project is in the 2035 or 2050 Year Built networks then the cost estimate funds all project phases. For 2025 most of these projects are already well past the Planning phase as they are in the Early Action Program - please see webpage here for the latest project information: <a href="https://www.keepsandiegomoving.com/RegionalBikeProjects/Introduction.aspx">https://www.keepsandiegomoving.com/RegionalBikeProjects/Introduction.aspx</a></p> <p>4) This item has been addressed.</p>
W456	Thomas Lichterman	Oceanside Bicycle and Pedestrian Committee	<p>The following are initial questions submitted on behalf of the Oceanside Bicycle and Pedestrian Committee to better understand Active Transportation project proposals in Appendix A.11, page A-35, of the 2021 Regional Plan, and thus be able to submit specific follow-up comments:</p> <p>Project AT003 - “Inland Rail Trail Phase 4” - Does this phase cover the entire segment within Oceanside?</p> <p>Project AT030 - “Coastal Rail Trail Broadway to Eaton” - Exactly what is this funding intended to cover? Would seem to be enough for a study but probably not design and construction.</p> <p>Project AT049 - “Inland Rail Trail Oceanside” - Is this funding the entire segment within Oceanside? How does this differ from project AT003?</p> <p>Project AT068 - “Camp Pendleton Trail” - Please provide the project limits of this proposed trail.</p> <p>Project AT073 - “Coastal Rail Trail Connections” - Where are these connectors? Are any in Oceanside?</p> <p>Project AT074 - “Coastal Rail Trail - Oceanside Segment 1 ALT” - What is this project and where is it located? What is it an alternative to?</p> <p>Project AT113 - “San Luis Rey River Trail” - What is this project? Is it an extension of the existing trail or a reconstruction of it? If an extension, what are the project limits?</p> <p>Project AT124 - “Vista Way Connector” - What is this project, and what are its limits?</p>	<p>AT003 Inland Rail Trail Phase 4: No, this is the section currently in final design, mostly in the City of Vista.</p> <p>AT031 Coastal Rail Trail Oceanside – Broadway to Eaton: This is to connect the Class 1 on Broadway from Vista Way to S. Coast Hwy via Eaton. It was conceptualized as Class 3 or bike boulevard. The project cost is an estimate for completing all project phases for this segment using median cost estimates from SANDAG EAP projects. The project costs will need to be updated once this project is included in SANDAG’s RTIP or CIP.</p> <p>AT049 Inland Rail Trail Oceanside: This is intended to fund the entire segment within Oceanside. AT003 is the segment east of this.</p> <p>AT068 Camp Pendleton Trail: I-5 SB ramps at Basilone Rd (northernmost extent) along Old Pacific Highway to ~ 33.335888, -117.503584 (southernmost extent).</p> <p>AT073 Coastal Rail Trail Connections: There are two connectors, both in Carlsbad: One on State St. in Carlsbad from Oak to Carlsbad Blvd, and one on Avenida Encinas from Carlsbad Blvd to Embarcadero Ln.</p> <p>AT074 Coastal Rail Trail – Oceanside Segment 1 ALT: The project is in Oceanside from the San Luis Rey River Trail connection at N Pacific St (northernmost extent) continuing south and jogging along Tyson St where the southeasternmost extent terminates west of the RR ROW. This alignment is an alternative to the 2000 CRT Project Study Report and</p>

				<p>2009 Regional Bike Plan. Note, the estimated costs will need to be updated once this project is included in SANDAG's RTIP or CIP, and the alignment may change in the preliminary engineering phase.</p> <p>AT113 San Luis Rey River Trail: Proposed extension of the existing San Luis Rey River Trail starting at the current terminus just north of College Blvd. and ending at Old Hwy 395.</p> <p>AT124 Vista Way Connector: This project's alignment follows E Vista Way and Vista Village Dr from SR76 (northernmost extent) to IRT Phase 4 (southernmost extent)</p>
W457	Tom Lichterman		The residents of Oceanside have been waiting for their segment of the Inland Rail Trail to be built since 1995, when the cities on the Sprinter corridor agreed in writing that the IRT was a priority. That's 26 years ago! The draft Regional Plan now says that project won't happen until 2035, another 16 years. That's 40 years to complete a bike trail! We must do better than that. Please prioritize finishing the IRT in the next five years!	<p>We are committed to complete this project's Phases and invite you to check out the project webpage at Keep San Diego Moving, sign up for updates at the link below if you have not already.</p> <p><a href="https://www.keepsandiegomoving.com/RegionalBikeProjects/inland_rail_trail_intro.aspx">https://www.keepsandiegomoving.com/RegionalBikeProjects/inland_rail_trail_intro.aspx</a></p> <p>And, we'd encourage you to be involved with the efforts of the North County CMCP if you are not already</p> <p><a href="https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=609&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=609&amp;fuseaction=projects.detail</a></p>
W458	Toshihiko Ishihara	SanDiego350	SANDAG RP (Regional Plan) must address the impacts of Climate Change as the highest priority along with the transportation transformation that the RTP envisions. We are seeing evidence such as big wild fires and severe droughts that indicate Climate Change is here and accelerating. According to the 2021 Draft RP, it will reduce per capita GHG emissions from transportation to 20% below 2005 levels by 2035. However, the County of San Diego's goal is to dramatically reduce the county's GHG emissions to reach net-zero emissions by 2035. I cannot logically understand how the 20% reductions of the GHG emissions from transportation sector will take us to the county's ambitious goal. Also, Appendix X shows that the GHGs from many sectors are mostly flat from 2035 through 2050, which is very concerning. All those projections lead to a conclusion that we will continue to generate GHGs at very high rates, which means that the current draft plan will not bring this region to compliance with the California state-wide goals listed in Chapter 1. Therefore, I hereby request SANDAG to clarify my above question and include specificities in the RP how it will conform to the ambitious GHG reduction goal.	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT, not through the use of zero emission vehicles.</p> <p>The GHG Inventory (Appendix X) analyzes emissions from all sources and the projections account for state and federal legislation currently in place, as well as strategies within the 2021 Regional Plan. The Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
W459	Tov Aod	Oppressed Taxpayers	SANDAG betrayed the taxpayers before when they were obligated to repair, maintain & construct more freeway & highway lanes for drivers. You only made carpool & bus lanes and trolleys & rail. We cannot trust you thieves, dictators & autocrats. You want to steal from us using the authority of government, but you are not subject to the will of the people. We will vote every Marxist SOB out of office & fire each one of you overpaid tyrants every chance we get. We do not want to be forced into mass transit to catch Covid or the next disease de jour. We don't want to get mugged or killed by the criminals that prey upon riders. We can't spend 2 1/2 hours to get somewhere that only requires a half hour drive. We can't walk miles to & from bus stops to work or carry enough bags of groceries on a train. We refuse your oppressive gas taxes, tolls, and per mile charges! We already pay the highest gas taxes in the country, but it's never enough to satisfy you. Your social engineering repulses us. You spend & waste billions of our tax dollars without being accountable or following the law. We want to disband SANDAG as formed, since the county supervisors should be following the transportation desires of their constituents ( and getting voted out of office if they don't!). You unelected bureaucrats seek tax increases from us without any care that you are driving many to flee this Communist regime. We can't afford to live here if you get your way, but you would force grandma into danger & poverty. You are truly heartless. Go to Hell!	<p>Transit Leap greatly increases transit speeds, frequency, and span of service providing a compelling alternative to driving. Flexible Fleets help address access to transit facilities and travelers' final destinations. Complete Corridors with continue to provide mobility and access to all modes throughout the region.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all. Oversight of public agencies is important and SANDAG welcomes public review of its work and processes. Federal and state agencies regularly review SANDAG and there are two ongoing local oversight processes with the Office of the Independent Performance Auditor and the Transnet Independent Taxpayers Oversight Committee.</p> <p>SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.</p>
W460	Valentina Molteni		<p>SANDAG's plans for the SR-94 in the 2021 Regional Plan and all relevant planning processes ought to achieve the following:</p> <ul style="list-style-type: none"> <li>- Honor the spirit of the SR-94 Complete Corridor community visioning process from 2015</li> <li>- Our priorities from the 2015 community-led visioning process remain -- Transit priority lanes, freeway cover park between 25th St &amp; 22nd St, Centerline Bus Stations at 25th St for Rapid 235 &amp;</li> </ul>	<p>The 2021 Regional Plan advances several of these ideas including managed lanes along SR 94 from Interstate 5 to SR 125, transit leap service, and several active transportation enhancements. Please see Appendix A for more project details. As projects advance into implementation additional planning, public involvement, and design will be necessary. Please continue to follow along and participate at <a href="http://SDFoward.com">SDFoward.com</a>.</p>

W461	Victoria Lopez	National Latino Research Center	<p>No me gusta que a veces los buses pasan tarde y llegamos tarde al trabajo. Nuestro sistema de transporte público no es confiable. Espero que este plan cambie esto.</p> <p>***</p> <p>I don't like that the buses arrive late and we arrive late to work. Our transportation system is unreliable. I hope this plan changes that.</p>	<p>SANDAG está consciente de que se debe hacer algo ahora para tener un transporte público rápido, frecuente, confiable y accesible, particularmente en la rutas de mayor uso. Nuestro personal llevará este asunto ante el Comité de Transporte y la Mesa Directiva de SANDAG antes de la aprobación del Plan Regional 2021 para modificar el presupuesto de la agencia y tomar medidas ahora para invertir en un transporte público que beneficie a las comunidades de justicia ambiental. Esta acción trata de aumentar los servicios en las líneas del transporte público que tienen un servicio poco frecuente en las noches y madrugadas y/o crear subsidios para hacer que las tarifas sean gratis para los jóvenes usuarios. También se añadirá lenguaje aclarando aún más las mejoras propuestas para la red de autobuses, incluyendo mejoras en la frecuencia y en el alcance del servicio, al Anexo A del Plan Regional 2021 final propuest.</p> <p>***</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
W462	Victoria Lopez	National Latino Research Center	<p>A veces hacen juntas así en las escuelas, pero creo cuando pasa algo (que no está bien) es cuando hacen algo así como este plan. También, a veces hay seguridad...pero las mismas personas no respetan al peatón...por las prisas. Nuestras aceras deben ser más seguras. Aquí en Vista tenemos un lugar donde los estudiantes necesitan caminar a la escuela como RMMS y no hay aceras seguras para ellos. Necesitan caminar por donde conducen los autos, lo cual es muy peligroso.</p> <p>***</p> <p>Sometimes they have school meetings in the schools, but only when something bad happens is when something is done, like this plan. Also, sometimes there is security, but those same people do not respect the pedestrians during the rush. Our sidewalks need to be safer. Here in Vista we have a place where the students need to walk to school, like RMMS (Rancho Minerva Middle School), and there is no safe sidewalks for them. They are forced to walk in the street with cars, which is very dangerous.</p>	<p>El borrador del Plan Regional incluye un programa Visión Cero para hacer que el sistema de transporte sea seguro para todos los usuarios. Las acciones a corto plazo incluyen el desarrollo de un Plan de Acción Regional Visión Cero que incorpora una Política Regional de Seguridad y la creación continua de proyectos que enfatizan la seguridad de todos los usuarios de la carretera para implementar la Visión Cero. Puede encontrar más detalles en el Anexo B. Proyectos regionales para bicicletas y peatones están en marcha a lo largo de la línea del Sprinter, en el Sendero Ferroviario del Interior, pero estos proyectos no mejorarán las condiciones en las áreas que ha identificado. El Distrito Escolar Unificado de Vista puede ayudar a mejorar las condiciones alrededor de las escuelas y usar guardias de seguridad en los cruces peatonales. Las banquetas locales son jurisdicción de la Ciudad de Vista. Por favor también considere participar en los esfuerzos del Plan Integral del Corredor Multimodal del Condado Norte.</p> <p>Su comentario ha sido compartido con las agencias gubernamentales que supervisan estas instalaciones.</p> <p>***</p> <p>The draft Regional Plan includes a Vision Zero program to make the transportation system safe for all users. Near-term actions include developing a Regional Vision Zero Action Plan, incorporating a Regional Safety Policy, and a continuing action to build projects with an emphasis on safety for all road users to implement Vision Zero. See Appendix B for more details.</p> <p>Regional bicycle and pedestrian projects are occurring along the Sprinter line, the Inland Rail Trail; however, they will not directly improve the areas you've identified. The Vista Unified School District can help improve the conditions around the schools and with the Crossing Guards. Local sidewalks are under the purview of the City of Vista. Please also</p>

W463	Vincent Colavin		Please amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth (ages 24 and under) receive priority when transit fare subsidies are allocated.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
W464	Wanda Curtis		This plan does not address issues for taxpaying south bay residents. The trolley corridor, Eastlake via I-125 is no longer, now a bus to the border. Our college students cannot easily get to colleges (owners were told Trolley corridor via I-125 to I-8 Mission Valley trolley). I-125 became a toll road when it was originally free. How does this plan move our Chula Vista residents to college and work? It moves border crossers to downtown. I do not see a benefit from any of your last plans for my family and neighbors here in Eastlake.	This plan includes several new Next Generation Rapid routes that will serve South County residents and provide them with access to Southwestern College, SDSU, and UCSD. The Next Generation Rapid fleet is the best option for ensuring that as many people as possible across South County and the region have access to employment centers.
W465	Wanda Curtis		South bay plan should include removing the toll from I-125. Making North and East counties more accessible and useful for students (SDSU, Mesa, Grossmont) and workers.	There is a plan to remove the toll from SR-125 once the toll road's debt service has been paid off.
W466	Wanda Curtis	Tax paying home owners /self	I do not agree with the priorities set forth for the south county/Chula Vista area. I am a native IB/CV resident and do not see the current plan benefitting us. The original plan that connected the eastern parts to the north directly benefitted residents. Students could take direct transportation (trolley lines) to SDSU and east. The current plan only supports border crossers not residents, students, families. You have changed plans so often (125 from free to fee, no trolley corridor to the east and north, etc.) I feel like residents are not being considered or listened to at all. The best option is to complete the ring of transportation east and north in the south bay. Contact me for more comments.	The Regional Plan includes substantial new services throughout South County. While the border is emphasized with new services and facilities there are a number of new Next Generation Rapid routes, improvements to the existing trolley and bus lines. Many of the changes identified were the result of extensive data analysis and land use development.
W467	Webb Lana	N/A	Please make student transit passes a priority.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
W468	Will Micklin	Ewiiaapaayp Band of Kumeyaay Indians	Why does the plan not include, or depict in any map, east San Diego County that is east of central Alpine?	The proposed final Regional Plan will be updated to include a map of entire county. The Data Viewer on <a href="http://SDForward.com">SDForward.com</a> provides interactive maps that can zoom and pan across the region to explore eastern San Diego County and the rural corridors included in the draft plan. There are a number of full county maps throughout the technical appendices: Appendix I - Tribal Consultation; Appendix J - Megaregion; and Appendix A includes a Rural Corridors map showing the full county.
W469	Yasmin Musse	Nile Sisters Development Initiative	good presentation	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W470	Yolanda Flores	Bayside Community Center	Yo en un futuro veo mas carros electricos en San Diego y consumiendo menos gasolina y menos contaminacion para nuestras generaciones futuras ojala todos tuvieramos mas conciencia de mantener nuetra comunidad mas limpia menos basura y menos contaminacion paraque nuestros hijos. *** I see more electric cars in San Diego's future using less gas and producing less pollution for the	Gracias por su comentario. El Plan Regional 2021 incluye inversiones en la infraestructura de transporte y en programas que incentivan el uso de vehículos eléctricos para reducir la contaminación en nuestra region. *** The 2021 Regional Plan includes investments in transportation infrastructure and electric vehicle incentive programs to reduce pollution in our region.

			future generations. I wish we all were more conscientious and that we kept our community cleaner and produce less trash and pollution so our children.	
W471	Yolanda Rodríguez	Mid-City Can	Necesitamos pases gratis para nuestros estudiantes de la comunidad. *** We need free passes for the students of our community.	<p>Una de las Acciones de Implementación enumeradas en el Anexo B es un Estudio del Impacto Regional de las Tarifas. Este estudio permitirá que las partes interesadas publicas tengan la oportunidad de expresar su opinión sobre las alternativas. Se espera que el estudio finalice en el año fiscal (FY) 2024 e incluirá una evaluación de los subsidios para las tarifas de las personas de bajos ingresos, los adultos mayores, los estudiantes y los jóvenes. Mientras tanto, el personal de SANDAG, MTS y NCTD está trabajando con las partes interesadas en un programa piloto de un año que puede ofrecer tarifas gratis a los jóvenes menores de 19 años.</p> <p>***</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
W472	Yuliya Pidcock		Please, consider replacing all abandoned street lights in Rancho Del Oro, Oceanside. It is not safe.	<p>Maintenance of transportation infrastructure is critical to a well-functioning and safe system. Maintenance of streetlights is generally the responsibility of the jurisdiction's department of transportation or Public Works Department.</p> <p>Your comment was shared with a Principal Civil Engineer at the City of Oceanside.</p>
W473	Yvonne Elkin		I have been watching the development of the 5 Big Moves for, I think, almost 3 years. This is absolutely the direction San Diego needs to take. I understand the cost and time are daunting, but this is something Southern CA should have begun decades ago. Now we have no more time to delay. Please move forward with the 5 Big Moves.	We appreciate your support and feedback. SANDAG is working on designating pilot programs and near-term projects to begin implementing some of the elements outlined in the proposed final 2021 Regional Plan. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W474	Zachary Robertson	The San Diego LGBT Community Center	I am a part of the Youth Queer Leadership Committee, and not only will free transportation benefit me, but it will also help the people I support like underprivileged and queer youth who cannot afford a car or are too young to drive. Making transportation free would allow more students to go places without their parents having to spend gas money or take time off work to take the child there. Free transportation would allow them to get there safely. Also students are needing more jobs because of college as well as to help with family bills. With more students traveling makes for a more diverse community as well. In my personal experience someone from South Bay took the bus to their job in Mission Beach. They said they took it every time they worked. Many people depend on public transportation to get to work, and spending money for bus passes is a lot for them, and they would have to earn it back, and many jobs that are being offered to teens and young adults are minimum wage. So I encourage you make transportation free for youth and underprivileged young adults. Cars are scarce in the market as we speak and many youth can't afford one either that is why public transportation is becoming more popular. Also since our economy was just hit with unforeseen causes many families are struggling to get the funds to even buy a bus pass, not including saving for a car. So I incline you, make public transportation free so that the future of this country can be a diligent as the collared workers before them.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
W475	Zenaida Lim		Waiting time is ok.	Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W476			<p>You are out of your minds, wanting to charge people per mile to drive on the road network. Firstly, nobody is going to be honest with you; implementing the tax is going to cost more than the revenue it brings in. Second, we already pay some of the highest DMV registration fees in the country, which is supposed to cover the cost of the infrastructure, but has been so significantly mismanaged that you are running a deficit. Third, this plan will have a cascading effect on goods and services: a not insignificant amount of people use their vehicles for work and are reimbursed for their mileage. Adding a fee per mile would increase the cost of employment, which will inflate the product price of the business which is impacted.</p> <p>Your plan is incredibly dumb, and I honestly don't know how you thought it would be a good</p>	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources. The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and

			idea, other than getting aroused by bleeding the citizens dry to cover your money management shortcomings. This state is getting worse and worse by the second.	community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.
W477			This plan is municipal robbery from innocent taxpayers who will never see any benefit. Leave well enough alone. Telecommunication, flex working hours, declining birth rates, rising home prices will all contribute to changing transportation needs. Also Amazon, US Mail, FedEx, and UPS should be restricted to deliveries every other day in all areas. Delivery vehicles should be all electric, carbon free emissions.	<p>The 2021 Regional Plan envisions a transportation system that will evolve as our mobility needs continue to change well into the future. One of the key strategies in the Regional Plan is to support the expansion of Flexible Fleets like on-demand rideshare, microtransit, and last mile delivery services to move people and goods more sustainably.</p> <p>These technology-enabled services are available on-demand and vary in size to cater to different trip purposes. Flexible Fleets also include last mile delivery services like those provided by electric bikes, autonomous shuttles, and drones to deliver packages to our homes, work, or Mobility Hubs. SANDAG intends to collaborate with local jurisdictions and the last mile delivery providers to plan and test delivery services that contribute to our mobility, equity, and sustainability goals.</p>
W478			Proposed Grand Central Station would be a huge waste of money. It would add a stop and increase time required to get to the airport. Money should be spent on freeway corridor trolley lines and branch bus lines. I use the trolley and bus every day. Getting to the airport is no problem. Travelers with light luggage can easily use trolley and bus to get to the airport. Travelers with a lot of luggage do not use public transit and will not use a Grand Central Station.	The Central Mobility Hub will have fast, frequent, and convenient connections between existing and planned transit and the airport. The MTS Route 992 bus will continue to serve the airport from Downtown San Diego.
W479			I call for an improvement in the bus system now that is fast, frequent, reliable, and accessible through increasing frequency on popular lines, especially overcrowded ones. Therefore, I call for more clarity in Appendix A: Transportation Projects, Programs, and Phasing that provides a list of specific improvements to the bus system.	SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
W480			I see and agree with some of your ideas and plans but there is much that I don't agree with. I think that the Hub Centers are too big and costly and will not work until you have enough population density to support & use it.	Each regional Mobility Hub coverage area was identified based on a variety of factors including existing and projected population and job growth along with information on where and how people travel. Many existing trip destinations fall within areas that have been identified as a regional Mobility Hub, yet some of these communities lack convenient transit service or safe streets to walk, bike, or use other micromobility options. While not every regional Mobility Hub may feature a large transit station like the Central Mobility Hub, there may be opportunities to add mixed-use infill development near existing and proposed transit lines in locations that can accommodate growth. Funding Mobility Hubs is a truly collaborative effort between SANDAG, local jurisdictions, transit agencies, private developers and employers, and more. Given the large number of Mobility Hub stakeholders, innovative public-private partnerships can be forged to fund, design, and implement various aspects of Mobility Hubs including stations, complete corridors improvements, and other Mobility Hub amenities.
W481			I disagree with your projections of both funding and population. In order to pay for your infrastructure you say we need higher population therefore increase density which justify residential high rise building. I will not live in a place like Miami with a wall of buildings blocking the coast. You can better use the tax revenue you are getting now to modify what we already have. Instead of having to reinvent the wheel. i.e., I would probably use the trolley more today if there were a micro transit system to get me from my house to & from the station easily.	SANDAG updates population and funding projections as it updates the Regional Plan every four years. The 2021 Regional Plan includes investments in Flexible Fleets that would offer services such as microtransit.
W482			Sometimes I ride my bike places and sometimes I drive my car. I don't like the removal of parking spaces happening now and supported by this plan. Please keep parking spots on the streets in front of retail and restaurant locations. Most importantly, do not plan to compel drivers to not drive by increasing costs to do so.	The 2021 Regional Plan includes a variety of projects and programs to improve the transportation system for all modes of transportation in the San Diego region over 30 years. This includes investments to improve roads and freeways as well as public transit and active transportation. Every bike project will go through a detailed planning and design process focused on providing the safest facility but also considering factors like

**Draft 2021 Regional Plan Responses to Comments – Website Sourced**

ID	Commentor Name	Agency	Comment	Response
				parking demand. Regarding your comment about costs to drive, gas tax revenues have been declining as vehicles become more fuel efficient and more electric vehicles are on the roads. A road usage charge would be a new funding mechanism to replace the gas tax. Road usage charges are being considered by transportation agencies across the country.
W483			Please consider no cost transit passes for youth to receive priority when transit fares are allocated.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.
W484			I don't see any performance measures for average commute time, or for average trip times overall. Please include a performance measure for average commute time for ALL of the region's population.	For information regarding performance metrics, travel times, and other such data, please see Appendix H.
W485			This comment is in reference to the proposed tax increases in order to fund these asinine new projects that only a handful of people will take advantage of. It is shameful for SANDAG to propose new mileage taxes on working class citizens, especially when we are coming out of the Covid-19 pandemic. Why are hard working San Diegans being penalized for having a job and commuting to work? Working families and individuals are already struggling with an extremely high cost of living in San Diego, and most of us are barely making ends meet. We already pay the highest income tax, we have the highest sales tax, high property taxes, and we already pay \$1.19 per gallon for gas! ENOUGH! I have yet to see the road repairs that the revenue from gas taxes were allotted for. The only "improvement" I have seen is painting the freeway numbers on the road. Can we please have an audit to show exactly where those gas tax funds were diverted to? Clearly those funds are not being used for their intended purpose. I am a third generation San Diegan who can no longer afford to live in the city where I was born and raised. My parents, elderly grandmother, aunts, uncles, and cousins who are all born and raised San Diegans are being forced to leave our city due to no longer being able to afford to cost of living here. San Diego politicians and agencies don't care about San Diegan's, this is clearly evident with the audacity to impose new taxes and mileage tracking. It is a slap in the face to each and every working class San Diegan. NO NEW TAXES!!	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.  The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.
W486			How will the new per-mileage tax effect Uber, Lyft, and food delivery drivers? Since these workers will be penalized for driving extra miles as the result of the new tax, individuals will likely stop working for these companies. Please consider how this tax will effect the individuals who work for these companies in order to support themselves.	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. This study will also assess the potential impacts on businesses, particularly those relying heavily on transportation to do business. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. Whether Uber, Lyft, and food delivery drivers would be subject to a road usage charge, and if so, how it may impact the drivers and users of those services, will be analyzed as part of this effort.
W487			Why isn't SANDAG focusing easily implementable projects in areas that WANT them? Why not prioritize throwing down bike lanes extravaganza in communities that wont fight them like in equity communities? Where is there not an "ease of implementation" weight (along with equity considerations, since obviously at times there are more challenges within equity communities)	As an early action of the 2021 Regional Plan, SANDAG will be developing a new Active Transportation Plan. The plan will take a fresh look at the network and the options to make it safe and comfortable to use active transportation. SANDAG prioritizes community engagement and will develop these connections in partnership with the community so that we can make sure the routes take people where they want to go.
W488			Do not go forth with the Mobility Hub at former Navy - SPAWAR building. It will be a failure since people will have to do out and backs to the airport, wasting time. Multi modal should be from Santa Fe station to the terminals.	The Central Mobility Hub is being considered at the Navy's Old Town Complex formerly known as SPAWAR as well as other locations as part of an ongoing environmental review. A fast, frequent, and convenient transit connection to the airport is a key component of the project.
W489			Supports this plan and wants there to be more connection hubs near the schools so all the students are able to use public transport to get to their destinations. Parent has to leave for work early in the morning, and can't drop their students off at school. Would like for there to be a more valuable and reliable way to get to schools. Uber is too much to pay when we receive	The 2021 Regional Plan has redefined the transit network to include a 'support system' of regional Mobility Hubs and Flexible Fleets to expand the reach of transit and ensure major destinations like schools are more accessible. Funding for an array of Flexible Fleet options is included in the Plan to help make these services more affordable and

## Draft 2021 Regional Plan Responses to Comments – Website Sourced

ID	Commentor Name	Agency	Comment	Response
			minimum wage, and even then, there is an element of safety that cannot be overlooked. Is willing to consider ride-sharing with public but as long as it's affordable and safe.	accessible. Additionally, the Plan demonstrates how 41% of low income residents will be within ½ mile of a commuter rail, light rail, or Next Gen Rapid stop by 2050.
W490			I think it's good for us who have no choice but to drive somewhere. I support this plan and all the proposals. I used to ride the bus a lot, but I found it complicated when the schedule was too far apart, and that meant that I had to keep in mind the fact that they might be late on their route, so I would have to leave my house far earlier than I would with my own car. Its own lane for the bus could help it keep on schedule and ease traffic.	We appreciate your support and feedback. The 2021 Regional Plan includes increased service spans for the trolley and bus service up to twenty hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24 hours.
W491			This would be good for all people in NC, especially if it can help ease the traffic on roads and highways. It would also be good to people who take the train to be able to reach their destination faster and closer to their actual goal.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W492			Why is Vision Zero apparently relegated to two measly paragraphs buried in appendix L? If this is really a bold new vision, Vision Zero should be a major tenet of that. People are dying because they don't use or own earth and people killing two machines to get around. This is atrocious and public agencies cow to bigger priorities as if providing safe ways to get around is just a second thought because an aspirational "CMH" is sexier or god forbid people sit in traffic on the freeway. I am losing friends and community members to being hit by cars in bike lanes and crosswalks and I hear just the barest of lip service. Where are your "info bites" on this epidemic against healthy mobility? Of course people don't go anywhere by foot or bike - someone might just run you over because the streets are designed for people to go fast and pay minimal attention. SANDAG has shown it can be a leader, but it is failing the most vulnerable (and cleanest) modes. I'm depressed when I decide to drive a mile to the store because I don't feel safe walking or biking with my kid there. I am actively choosing to produce GHG and make the environment worse for others because I don't want to die on the way there. SANDAG Exec Dir is "fearless" when it comes to demanding a world class public transit system, but he is decidedly less vocal about using his agency to elevate the plight of walkers and bikers. Bike advocates are dismissed for turning out and being vocal and having an outsized voice. We have to because this is literally life and death for us. Please hear us. (Sidenote: aside from safety, we need more secure bike parking that isn't just tied to transit stations please! I want to patron businesses but when hooked to a lamppost, I am less likely to stay for long or go somewhere like the movies or long dinner where I can't have eyes on my bike.	This is the first time SANDAG has included Vision Zero in our Regional Transportation Plan. For all the reasons you pointed out, it's entirely necessary and cannot wait any longer. SANDAG has a unique position in the region to help coordinate Vision Zero efforts happening at each individual local agency into a regional approach. The mention of Vision Zero here initiates that process but we clearly have much more to do. Additionally, as you mentioned, we at SANDAG include bike racks and secure parking in conjunction with our transportation projects but have also provided grant funding for the City of Oceanside to set up a secure bike parking area near their City Hall. We will continue to work with local agency jurisdictions through our Smart Growth and Active Transportation Grant programs to increase the number of secure parking areas for bikes and personal micromobility devices. Thank you for your comments.
W493			Any plans to have a ferry that goes to Ensenada and other Baja ports? I see Seattle and Miami has ferries that take tourists to other countries. One reason why I can see some people wanting to use a ferry is to not have to wait in line driving back.	SANDAG appreciates your support and feedback. The 2021 Regional Plan calls for continued collaboration with partners at the local, state, and federal levels in Mexico to plan and implement projects and programs to better facilitate crossborder mobility. SANDAG looks forward to exploring opportunities to enhance multimodal access between the San Diego region and Baja California via land and seaports in our ongoing collaboration with binational partners. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W494			Please...let's not get breathlessly caught up and over-perform in the trendy, political topics of "sustainability, social equity and climate change". Be careful not to knee-jerk your approach in developing tactics and solutions to convey an appearance of "doing something" about these hyper-hot, media-driven issues...most of which are hyperboles, anecdotal, and unproven. Take a logical, pragmatic approach to our regional growth planning and leave the political crap out of the strategy please.	Thank you for your comment.
W495			In the general bicycle guidelines, you write: "There is increasing interest in applying sharrows in conjunction with bike lanes on steeper slope roadways. Bike lanes are placed on the uphill side of the roadway and sharrows are placed on the downhill side of the roadway to encourage fast moving bicyclists to position themselves away from parked cars." This is excellent, many cities (e.g. Seattle) use this widely with much success. But this area (i.e. the challenges of San Diego's unique topography) is still comparatively underdiscussed. I think there needs to be more focus on how to encourage biking when many routes are challenging due to topography (steep uphills), not just infrastructure (lack of bike lanes). This could mean constructing more bikeways that traverse easiest-way-up routes for steep roads, instituting frequent shuttle services for steep routes, etc. Painting bike lanes and building bikeways will not necessarily spur ridership if the routes are still inherently too challenging or too dangerous for many riders.	The bike network shown in the plan is the Adopted Regional Bike Network, which was adopted in 2010. As an early action out of the 2021 Regional Plan, SANDAG will develop a new Active Transportation Plan. Although the original plan considered topography, we will take a fresh look in the new one. With the ever increasing popularity of e-bikes, we do feel it is important to build bike network in both flat and steep areas so provide as many network connections as possible.

## Draft 2021 Regional Plan Responses to Comments – Website Sourced

ID	Commentor Name	Agency	Comment	Response
W496			The airport connection should be extended Liberty Station/Point Loma/Ocean Beach/Mission Bay. This would make it a much more useful transit line than just an airport connection. I think people would also sacrifice some speed in public transit for a more extensive network. Turn every six lane street into four lanes and every four lane street into two lanes and add protected cycle tracks and bus lanes and wider sidewalks. A lot of San Diego streets are really wide and should be able to add this easily.	The Central Mobility Hub will have fast, frequent, and convenient connections between existing and planned transit and the airport. The MTS Route 992 bus will continue to serve the airport from Downtown San Diego.  Regarding the reduced travel lanes, the Active Transportation and Demand Management, complete streets, and Mobility Hubs included in the Plan will consider these types of improvements during the project development process.
W497			There should be more short term spending instead of projects finishing by 2050. Bike and bus lanes can be done really quickly.	Projects within the 2021 Regional Plan are phased for different beginning and completion dates based on a number of factors. The construction timeframe of different types of projects is one of those factors. There are many projects that can be completed quickly, such as bike and bus lanes, that are scheduled to be completed towards the beginning of the plan.
W498		NLRC	I don't use public transport, but my son does. I do think there is room to have more bus stops, since they have taken many of them away over the last few years. I really use my own car more than not, but my son does need to rely on public transport. I'm in support of anything that decreases traffic, and adding multimodal lanes that have specific purposes.	The 2021 Regional Plan includes substantial investment in public transportation that will make your son's commute and others around the region significantly easier to navigate.
W499		NLRC	This plan sounds great, especially the part of flexible fleets resulting in better access to public transport and not having to walk to far away bus stops. I drive mostly everywhere, but I've had to give rides to people to their bus stop that was too far to walk. I support this plan fully.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W500			I think that the 2021 plan is a great start to creating a San Diego where you can easily get around by transit or cycling as opposed to driving. I'm very excited about the future of the region. Hopefully the cycling network can be expanded past what is recommended by SANDAG here.	We are excited as well and have seen a lot of great projects implemented by our local agency partners directly on or connecting to the adopted regional bike network, as that is more competitive in the scoring, via Smart Growth and Active Transportation Grant Projects SANDAG administers. Still there are plenty of instances where local agencies are doing great work with their own local streets and roads projects to improve neighborhoods for all roadway users through bike and pedestrian countermeasures in conjunction with sewer replacement projects and the Streamview Drive project in the City of San Diego is a good example.
W501			I will not use public transit until it is more efficient and cleaner. Right now to take the trolley downtown it can take 20-30 minutes not to mention dealing with the homeless and sanitary conditions on the trolley. I can drive my own vehicle downtown and be there in 10-15 minutes.	The Transit Leap in the 2021 Regional Plan will make the public transit system faster and safer. Travel times for many riders will be much better than in the past.
W502		El Cajon Collaborative/ East Co. Senior Service Providers	Love that there will be a transit center located in El Cajon. It will make accessing transit (downtown) other than the other trolley stops. Thank you.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W503			On Pages 38 and 42 regarding the road user mileage tax. This is unfair. There does need to be a way to offset the all-electric plug-in car not paying the tax at gas pump. The answer is to apply a mileage tax on those cars only. Taxing all cars would be a double tax on cars using gas. Please if you are going to apply this tax, only apply it to the all-electric plug-in cars as that would be a fair offset to them not paying at the pump which they should be paying as they use the roads too! This will balance the funds if done properly. Thank you	Nationwide states and regions are confronting the shortfalls of gas tax revenues to fund maintenance, operations, and construction of their transportation systems. The federal gas tax was the largest source of transportation funding for many decades. However, the federal gas tax per gallon has not changed since 1993, that is when the minimum wage in California was \$4.25. The federal gas tax does not grow with inflation and the purchasing power of that source has diminished over time. States and regions have implemented their own sales and gas tax measures to try and meet the needs of their transportation systems. However, the best tax measures tied to fossil fuel consumption will continue to erode in time as vehicle technologies change.  The 2021 Regional Plan is a long-range planning document and includes reasonably feasible funding options. Significant additional work, including public involvement, pilot testing, legislation and much more will be necessary to inform implementation of elements of this plan. At a minimum this plan is updated every four years with the latest in planning ideas and concepts.
W504		El Cajon Collaborative/Barrio Logan College Institute Parent	When will the transit center be built? It is wonderful that it is coming to El Cajon and will provide lots of new jobs.	The 2021 Regional Plan includes two new higher speed commuter rail lines that will connect the core of the El Cajon community to both Downtown San Diego and the Central Mobility Hub near the San Diego International Airport by 2050. However, some improvements to the existing light rail services connecting to El Cajon will take place by

**Draft 2021 Regional Plan Responses to Comments – Website Sourced**

ID	Commentor Name	Agency	Comment	Response
				2035, including increasing the miles of light rail track to support more frequent Trolley services (every 10 minutes during peak periods). Please refer to “Table A.7: Interstate 8” in Appendix A for more information.
W505			Congestion pricing and/or pricing general travel (freeway) lanes is the most effective way to make the regional system function efficiently and then the proceeds can fund transit and active transportation. The world over has proven the effectiveness and NY is trying to get onboard. Don't let the SD region waste years when the solution is so obvious. Be the big move that you purport to be.	Thank you for your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W506		El Cajon Collaborative/Barrio Logan College Institute Parent Arabic	The ticket price for the trolley is too expensive. We need affordable tickets for low-income families to use the service. It is difficult to purchase tickets and they cost too much. Thank you for the Plan and I approve.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
W507		El Cajon Collaborative Meeting	This is exciting! I support the plan and excited to see what the future looks like.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W508		El Cajon Collaborative Meeting	So exciting! Great presentation. Thank you for sharing such innovative ideas on moving people and goods from one place to another, safely, affordably, and fairly.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W509		El Cajon Collaborative Meeting	Is SANDAG planning on widening and/or straightening Hwy 94 from El Cajon (Rancho San Diego) down to the border? This is one of the worst roads now. We have people speeding, crossing double yellow lines to pass (and this is with oncoming traffic), passing on curves, running stop signs/signal lights, etc.	Project CC062 is a Complete Corridors: Rural project to improve SR 94 from the Jamul Reservation to Tecate Road, expected to be complete by 2050. The improvements are focused on safety and include shoulder widening and straightening the highway.
W510		El Cajon Collaborative Meeting	Great meeting with great information. I enjoyed the presentation and seeing the final product. We have been talking about this for a long time and happy to see the final product. It includes the 5 Big Moves and transit centers in each subregion. Great job!	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W511		El Cajon Collaborative/ East Co. Senior Service Providers	Stations need to be cleaner and safe for people to use them. Thank you for such an inclusive plan that brings services to East County.	Buses currently receive daily maintenance. As part of COVID-19 safety protocols, buses are wiped and cleaned at the end of each run throughout the day. Additionally, all riders are required by federal mandate to wear a face covering or mask while on public transit.  SANDAG will continue to work partners, MTS and NCTD, to bring high quality, reliable, and clean transportation options.
W512		El Cajon Collaborative/Barrio Logan College Institute Parent Arabic	I appreciate the new transit centers that will be in each of the subregions. We really need a transit center in El Cajon, but our trolley stations are in dark, industrial areas that are frequented by drug deals and homelessness. They are not safe. They are also dirty and have no restrooms. Thank you for a plan to make transit centers safe and to add restrooms. I will use it in the future.	SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements. SANDAG will be working hard with the help of all of our passengers and representatives to ensure that this plan gets implemented.  The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.
W513		El Cajon Collaborative/Barrio Logan College Institute Parent	There are too many trucks on the freeway that cut in front of traffic. Will there be a separate lane for them and how will SANDAG control traffic? I approve the Plan and look forward to improvements to our freeways to protect people.	The shipping of goods fuels the regional economy. The flow of goods by truck, rail, air, and sea – throughout our region and across borders – generates a constant stream of raw materials, parts, and finished goods. They all keep us supplied with food, clothing, shelter, vital consumer goods, and discretionary items.  The 2021 Regional Plan includes a truck climbing lane on State Route 52. In addition, the 2021 Plan includes strategies through Next OS to improve overall efficiency and accessibility for people and goods to move throughout the region. For example, the Harbor Drive 2.0 project will include technologies to manage the flow of passenger and commercial traffic on Harbor Drive between the Port of San Diego's marine terminals.

W514		El Cajon Collaborative/ East Co. Senior Service Providers	Seniors often need assistance getting into vehicles. Volunteer programs need to be equipped to handle these needs. Thank you.	Seniors who need assistants may identify a personal care attendant that can ride for free. Please visit <a href="https://sdcommute.com">SDCommute.com</a> for more information on this.
W515		El Cajon Collaborative/ Community Health Working Group	Wonderful! It's about time! Thank you for such an innovative plan that includes our underserved communities. I love the equity statement and hope to see SANDAG stick to it.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a> .
W516		El Cajon Collaborative/ Community Health Working Group	If it is truly high speed with short travel times, I will use it. Both rapid buses, trolley and trains.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a> .
W517		El Cajon Collaborative/ Community Health Working Group	Seniors need rides so making it easier to access public transit will get them using it.	The 2021 Regional Plan aims to improve access to a quality public transportation system for all San Diego residents, especially for seniors and other disadvantaged populations. These improvements include transit fare subsidies for seniors and on demand Flexible Fleet services that are accessible to seniors. The 2021 Regional Plan projects a growth in senior access to parks and recreational facilities via walking, biking, and transit (see Appendix H for more information). In every metric senior access to transit, retail, medical facilities, and parks improves through 2025 and 2050.
W518		El Cajon Collaborative/ Community Health Working Group	Great idea to increase funding for senior volunteer driver programs and community-based organization funding. Seniors need more options, and the needs are growing.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a> .
W519		El Cajon Collaborative/ Community Health Working Group	Most senior volunteer driving programs are limited to 1 ride per week. We need additional services so they can continue to shop and access doctor's appointments. Thank you for the Plan.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a> .
W520		El Cajon Collaborative/ Community Health Working Group	Mobility choices for seniors need to have handicap access including volunteer drivers and CBO options.	The 2021 Regional Plan aims to improve access to a quality public transportation system for all San Diego residents, especially for seniors and other disadvantaged populations. These improvements include transit fare subsidies for seniors and on demand Flexible Fleet services that are accessible to seniors. The 2021 Regional Plan projects a growth in senior access to parks and recreational facilities via walking, biking, and transit (see Appendix H for more information). In every metric senior access to transit, retail, medical facilities, and parks improves through 2025 and 2050.
W521		El Cajon Collaborative/ Community Health Working Group	The backcountry (rural East County) needs buses and transit options now!	The proposed 2021 Regional Plan includes investments in all parts of the San Diego region. These are described in Appendix A and include access to buses and Flexible Fleet services for East County.
W522		El Cajon Collaborative/ Community Health Working Group	I used the Sprint when I lived in Escondido to Oceanside for work. I appreciated the ease of using public transit. Creating additional opportunities for transit travel will continue to bring new riders.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a> .
W523		El Cajon Collaborative/ Community Health Working Group	Many of our newcomers do not drive highways so are limited to the City of El Cajon. By creating safe travel options and education for them in their native language will open their world up to many new San Diego locations including better jobs.	The 2021 Regional Plan includes two new higher speed commuter rail lines that will connect the core of the El Cajon community to both Downtown San Diego and the Central Mobility Hub near the San Diego International Airport by 2050. However, some improvements to the existing light rail services connecting to El Cajon will take place by 2035, including increasing the miles of light rail track to support more frequent Trolley services (every 10 minutes during peak periods). Please refer to "Table A.7: Interstate 8" in Appendix A for more information. SANDAG will be applying a social equity planning framework throughout the implementation of the Regional Plan. Through this framework, one of the Regional Plan's near-term actions includes developing a Digital Equity Strategy and Action Plan that will address regional accessibility gaps in communications infrastructure, technology, and digital literacy. Within digital equity, we

**Draft 2021 Regional Plan Responses to Comments – Website Sourced**

ID	Commentor Name	Agency	Comment	Response
				have been working with our Community-Based Organization partners (or CBOs) to ensure that language translations and educational resources on transit are available to all San Diegans as we advance with our next OS system. For more information, I would like to refer you to Appendix B: Implementation Actions, Table B.1 on more information on the Digital Equity Strategy and Action Plan. For more information on our community-based outreach please see Appendix H: Social Equity: Engagement and Analysis.
W524		El Cajon Collaborative/Community Health Working Group	Newcomer students are often limited to colleges within their community because of travel challenges. The new trolley to UCSD and increasing options to other local colleges would make college choice more available to them.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W525		El Cajon Collaborative/Community Health Working Group	Safety is always a concern. I had a bad experience traveling the trolley with my child. Obscenities were shouted by riders, and we didn't feel safe. We need a method to alert security if there is a problem on a bus or trolley. Safety is a huge priority. Thank you.	SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.
W526		El Cajon Collaborative/Community Health Working Group	Many transit stations do not feel safe because of location. Both of El Cajon's stations are located in dark, industrial areas frequented by our unsheltered population.	SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.
W527		El Cajon Collaborative/Community Health Working Group	Many people are now teleworking since the pandemic. Was the change in travel to work taken into consideration when developing this plan? Will freeways continue to see traffic reductions as more people work from home? I am glad that you are looking into the future of transportation as the needs change.	The 2021 Regional Plan accounts for changing trends and technologies that may impact how we travel including telework, on-demand mobility services, and connected vehicle technologies.
W528		El Cajon Collaborative/Community Health Working Group	Technology is extremely important to trip planning when taking a trip by public transportation. Will my Uber be waiting or my shuttle? Will I make the connection to the next bus? What are real travel times? Thank you for taking these into consideration.	Flexible Fleets use demand-responsive technology to provide on-demand services, real-time arrival times, and optimize routing for the fastest route. With the Next Operating System (Next OS) proposed in the Regional Plan, real-time information from transit and Flexible Fleets will be integrated in the back-end. This data will be used to provide trip planning tools that provide accurate travel information and make planning, booking, and paying for a ride as seamless as possible.
W529		El Cajon Collaborative/Community Health Working Group	Wow--50 years is a long time!	The 2021 Regional Plan is a long-range planning document and is required by federal law to provide a reasonably feasible funding strategy for the projects, policies, and programs of the plan. Significant additional work, including public involvement, pilot testing, legislation and much more will be necessary to inform implementation of elements of this plan. At a minimum this plan is updated every four years with the latest in planning ideas and concepts.
W530		El Cajon Collaborative/Community Health Working Group	Coastal rail line super exposed to climate change. Please fix.	SANDAG and NCTD are currently developing a resiliency plan for the LOSSAN rail corridor that will address the impacts of climate change such as sea level rise, floods, fires, earthquakes, landslides, and other catastrophic events. The regional plan identifies LOSSAN corridor double tracking, bridge replacements, and other state of good repair improvements. Each of these capital projects consider the risks of climate change and are designed to withstand these effects to keep the rail line in operation.
W531		El Cajon Collaborative/Community Health Working Group	What happens when the grid collapses when you are in an "autonomous" car? At the time, the hope was that people would take trolley more, reducing wait time at traffic lights. We expected people to leave their cars for the trolley, but that did not happen.	SANDAG plans for emerging mobility technologies, like autonomous cars, and various considerations to ensure they are implemented safely. The 2021 Regional Plan includes frequency and span of service improvements for the trolley to make it more convenient for many people.
W532		El Cajon Collaborative/Community Health Working Group	Wow! A transit center in El Cajon. This is going to be so great!	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> . The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.
W533		El Cajon Collaborative/Community Health Working Group	Any talk about financial assistance for public transportation bus/trolley passes to address equity needs for community members? We encourage free transportation for students and seniors.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway,

				staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
W534		El Cajon Collaborative/Community Health Working Group	Wow! This is an amazing opportunity for El Cajon.	Thank you for your comment. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> . The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.
W535		El Cajon Collaborative/Community Health Working Group	Very cool! I support the Plan and all that it encompasses.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .
W536		El Cajon Collaborative/Community Health Working Group	Wow! This is incredible! Thank you for putting together such a complete plan! We encourage SANDAG to look at a shuttle option in El Cajon to move residents around the valley floor.	SANDAG is developing a Flexible Fleet Implementation Strategic Plan to identify near-term opportunities for Flexible Fleets including opportunities in East County. SANDAG intends to launch pilots to test different applications in 2022.
W537		El Cajon Collaborative/Community Health Working Group	Yeah, El Cajon!!! We are finally getting noticed.	Thank you for your comment. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> . The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.
W538		El Cajon Collaborative/Community Health Working Group	Amazing! Equity in the Plan. Thank you so much.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .
W539		El Cajon Collaborative/Community Health Working Group	This is fantastic! Do we know how many jobs it will create and what kind of skills we will need for these jobs? Please bring us more updates as they come and encourage SANDAG to continue to look at East County for future projects.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> . The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area. More information about the growth in overall jobs in the region can be found in Appendix F, according to the Regional Growth Forecast, we expect to see about 440,000 more jobs in the region by 2050.
W540			A tax on how many miles someone drives, is a tax on the poor. White collar workers can afford to work from home or live close to their offices downtown, the people we rely on the most for society to function like hospital workers, food service workers, they have to drive long distances to work. Don't punish people for commuting to work, the character of San Diego will start to suffer as a result. Also, the public transportation alternatives in San Diego are a joke. Everyone over at SANDAG should have to take the city bus for a year before making any public transit decisions.	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as low-income residents or residents with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p>
W541			Please don't do the mileage tax. Maybe when EVs are more prevalent, or add it to car registration but not this. Also, make heavier trucks (like trash trucks) pay more! They tear up the roads!	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.

				<p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. The fee structure could be related to the weight of the vehicle or its impact on the roadways. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as drivers with fuel powered vehicles, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p>
W542			<p>Adding another tax for driving on the roads is a horrible idea. This is punishing people for not being able to afford living by their place of employment. I am furious that this is being considered.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as residents with long commutes, are paying more than their fair share. W543			<p>NO to Road User Charges.                      San Diegans and likewise Californians already pay a lot in taxes.                      This is too much and too overreaching.                      Taxing our miles driven also means tracking our behavior with the proposed Next OS. This is another step in the erosion of our civil liberties and freedom of movement.                      Yes, taxes should pay for San Diego roads but we do not NEED more taxes. Especially in the form of one that double dips and erodes our freedom.                      Please operate and maintain our roads within the taxes already gathered.                      Set budgets/policies that match those taxes.                      Do not “drive” up taxes now based on future speculation.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources. The road usage charge provides an alternative to replace an old tax system that is no longer relevant.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. The mechanism to collect a future road usage charge has not yet been determined, but as the State of California transitions from the gas tax towards a road usage charge, SANDAG is anticipating leveraging the mechanism selected by the State. SANDAG is committed to privacy - we take it seriously and exercise that commitment with our current operations on both the I-15 managed lanes and the SR 125 toll road.</p> <p>SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving gas fueled vehicles, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p>
W544			<p>With costs of living so insanely high in this city, all that this proposition does is hurt the lower income people who can't afford to live near their place of work. The people who are wealthy</p>	<p>The 2021 Regional Plan envisions forecasted growth to be concentrated in Mobility Hubs throughout the region. Building more infill development near transit and jobs offers</p>

W546			<p>I live up in Vista and work as a registered nurse in the ER all the way down in La Mesa. Not only do I have to drive down there to take care of patients in the busiest hospital in the city but you're going to tax me on the mileage it takes me to get there?! That is not acceptable. What the hell is wrong with you people? King James would be proud for nickel and diming us peasants to death. You're going to tax all us hard working nurses for driving to work to care for patients of this city? How greedy are you? It's disgusting. This city is already so expensive for so many people who run this city (cops, teachers, paramedics, nurses, firefighters, etc.), it's not right that you're going to tax is while we drive the distance to our jobs.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. 				charged for miles driven in San Diego county. SANDAG will rely on coordination with other agencies in California along with the State Department of Transportation to integrate the selection of technology, collection methods, and account management to ensure a consistent experience for travelers.
W548			Proposing a mileage tax is nonsensical and would be another nail in the coffin in terms of motivation for my family to move out of this city due to even more ridiculous cost of living expenses. We already pay more for electricity in our sub-1000 square foot apartment (with NO AC) than any relative of mine who does not live in San Diego. Stop killing your citizens financially!	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. W549			It's nice to know the out of touch career politicians on the SANDAG board have no issue passing a regressive tax that disproportionately affects the less wealthy who have to commute since home prices are insane in this city.	Social equity disparity analysis is required by both state and federal law via Title VI of the Civil Rights Act of 1964 and Executive Order 12898. During the process of evaluating the 2021 Regional Plan, calculations were made to determine improvements in mobility by percent point difference, between a No-Build projection and the Build projection. A percentage point difference was then compared between a disadvantaged population and its counterpart (in both Build and Non-Build scenarios) to determine whether the difference between each population was substantial enough to merit further evaluation. Anything above a 20-percentage-point difference would result in further analysis. SANDAG found marginal percentage point differences between each population, with slight advantages leaning in favor of low income, aging populations, and other disadvantaged populations. For more information regarding social equity, methodology, and state requirements see Appendix H.
W550			Real bad inflation is harming us all financially. Quit steering us to public transportation. No more expenses, stop it!	Thank you for your comment.
W551			<p>I fully support the use of a VMT based fee, as a way to supplement fuel taxes as ICE cars are phased out. However, those fees should be proportional to the damage caused, using something akin to the <math>((\text{weight per axle})^4) \times \text{number of axles}</math> formula. If another formula more accurately estimates damage caused to the roadway by a certain vehicle, that's just as well.</p> <p>Cargo e-bikes should be a major part of the future of delivery services in San Diego for many reasons, one of those reasons being the negligible damage they cause to the road surface compared to cargo trucks. If heavy trucks are made to pay their fair share of road damage, it'll help incentivize lower-weight and more efficient modes.</p>	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving including degradation to the roadways, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program and developing a fee structure proportional to damage caused to the roadways is a component that will be explored.SANDAG will be exploring the regional use of cargo e-bikes through the upcoming San Diego and Imperial Counties Sustainable Freight Strategy, which will begin this winter.

W552			<p>I strongly oppose the usage mile tax, Californians pay the highest taxes on vehicle registrations, gas , sales tax etc., you are punishing those that have to commute to work because they cannot afford to move closer to the communities they work in . This will affect a disproportionate amount of minorities, people in the service industry, hospital , emergency service workers etc. Absolutely asinine that an additional tax would even be entertained in the midst of a pandemic and a shaky economy.</p>	<p>Social equity disparity analysis is required by both state and federal law via Title VI of the Civil Rights Act of 1964 and Executive Order 12898. During the process of evaluating the 2021 Regional Plan, calculations were made to determine improvements in mobility by percent point difference, between a No-Build projection and the Build projection. SANDAG found marginal percentage point differences between each population, with slight advantages leaning in favor of low income, aging populations, and other disadvantaged populations. For more information regarding social equity, methodology, and state requirements see Appendix H.</p> <p>SANDAG recognizes the need for more affordable housing for people of middle to low incomes households that are near employment centers and a variety of transportation options. SANDAG is currently developing a Regional Housing Incentive Program and will take several factors into consideration to ensure the program meets housing needs and the goals of the 2021 Regional Plan. The housing program will consider climate change, climate resilience, and consistency with the transportation improvements and land use goals included in the 2021 Regional Plan. SANDAG will also coordinate with the Social Equity Working Group and other interested stakeholders to ensure the housing program promotes equity and addresses issues like gentrification and displacement.</p>
W553			<p>The new taxation system derived on a basis of miles driven is asinine. Lower-income individuals often cannot afford to work in proximity to their employees, or must report physically for service jobs, unlike higher wage earners who have the flexibility to work remote. This will unfairly discriminate against lower socioeconomic pillars of our community that have been ravaged enough, and unnecessarily so: there are plenty other ways to secure the requisite funding to maintain infrastructure and reduce traffic congestion without penalizing the poor. If you're unable to fathom the ways in which this can be accomplished I reckon you're unfit for the work for which you've been assigned.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. W556			Please improve public transportation options to increase access to the beach. Inland communities like mine have less opportunities to enjoy the beach as a public resource. As climate change continues to worsen, having options for free cooling recreational opportunities is critical to public health as well.	The transit network that has been developed for the Regional Plan includes faster access to the beach. There are Rapid and Commuter Rail routes that will operate between Mid-City and the proposed Central Mobility Hub. From that location you can seamlessly transfer to routes that will take you to Ocean Beach, Pacific Beach and La Jolla.
W557			I like the various steps mentioned in the 5 Big moves, especially if it helps passengers get to their destinations a lot faster. I think the better option would be the multimodal roads for me because it could help ease traffic and prevent accidents and fines to those who fall under the right circumstances. It would also be better if these flexible fleets could serve the areas that the bus doesn't simply because of street conditions or for the lack of sidewalks. A more frequent schedule could also help people by not having to wait so long for their routes, so they might be less inclined to get into dangerous situations in order to catch it. Therefore, I support this plan.	Flexible Fleets provide sustainable and multi-modal options for traveling around the region. Since Fleets use technology to adapt to changing demands or needs, they serve as a great option in areas where traditional fixed transit may not work well. SANDAG is developing a Flexible Fleet Implementation Strategic Plan to identify near-term opportunities for Flexible Fleet services in partnership with transit agencies.
W558		El Cajon Collaborative/ East Co. Senior Service Providers	This is exciting! Thank you so much!	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W559		El Cajon Collaborative/ East Co. Senior Service Providers	Many senior volunteer programs are funded through SANDAG. Glad to see they will continue to support these programs with hopes to increase them in the future.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
W560			Public transport sucks...takes me 30 minutes to an hour more time to go anywhere by MTS. So people don't have much of a choice but to use their cars. Not all of us have the luxury of living close to work. Taxing the basic necessities in an over taxed city is not right. Also please evaluate the incomes of electric car owners and judge who will be unfairly impacted.	<p>SANDAG intends to use emerging technologies to provide a fast, safe, and reliable transportation system to the San Diego region. Personal vehicles will continue to be part of our transportation system, but we also intend to provide competitive transportation methods to the personal vehicle. By providing alternatives to the personal vehicle, we could actually alleviate highway congestion, make our roads and streets safer, and make our whole transportation system operate more efficiently.</p> <p>SANDAG recognizes the need for more affordable housing for people of middle to low incomes households that are near employment centers and a variety of transportation options. SANDAG is currently developing a Regional Housing Incentive Program and will take several factors into consideration to ensure the program meets housing needs and the goals of the 2021 Regional Plan.</p> <p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to</p>

Draft 2021 Regional Plan Responses to Comments – Website Sourced

				<p>make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, and fair to all.</p>
W561			The SANDAG Transportation Regional Plan sounds very promising for the community, businesses, tourism, and the people that live in Southern California.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .

E1	Abby Bateman	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>24 hour service is necessary to fill the service jobs in our economy. Please consider extended hours if nothing else.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions to achieve state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p>
E2	Alejandro Martinez	Outdoor Outreach	<p>As a member of Outdoor Outreach, a community organization addressing the inequities and disparities regarding access to outdoor spaces and within this addressing, as well, transportation justice, I can passionately say our communities need youth prioritized now. If their access to transportation is hindered by economic status, their opportunities infinitely diminish. Prioritize no-cost youth free passes now. Our youth deserve better.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under</p>
E3	Alex Wong		<p>Your 2021 Regional Plan features an impressive but expensive plan to link the region with \$100 billion+ of commuter rail to far flung suburban regions. This would be a very hard sell to voters.</p> <p>Instead, why not build just one fully-grade separated, frequent trolley line that serves dense, low-income neighborhoods, for \$10 billion or less? Designed correctly, this trolley line would attract massive ridership and be much more likely to be approved by taxpayers.</p> <p>This trolley line would go from Downtown through Balboa Park, on to North Heights, City heights, and all the way to La Mesa.</p> <p>As transit planner Jarrett Walker says, the best case for a rail project is an overcrowded bus line. Not only are lines 7 and 215 the busiest in the county, they run through some of the densest, largely low-income, parts of San Diego. Already there are complaints that route 215 is even slower than the bus line it replaced. A trolley line in that corridor would be a welcome alternative.</p> <p>I am glad that your 2021 plan includes a rail corridor from downtown to La Mesa. But I strongly believe that this corridor should be served by Trolley, not commuter rail. This corridor is one of the most densely populated in San Diego. Residents there would certainly prefer several neighborhood trolley stations within walking distance rather than having to take the bus to one giant regional rail</p>	<p>The mid-city trolley line (Purple Line) is included as the first major new rail project in the Plan. Additionally, grade separated rail is considered in the I-8 corridor as you mentioned but at higher speeds. Traditional trolley speeds are limited, especially when running with traffic as most of the trolley system does. Additionally, Rapid services are planned that can use dedicated roadway space to increase speeds and avoid congestion. The vast majority of these Rapids also are planned in near-term phases of the Plan.</p>

			<p>station further away.</p> <p>Your plan stresses that you want mass transit to be at least as fast as car travel. El Cajon Blvd and University Ave are congested streets, and a fully-grade separated trolley running through that corridor would easily be much faster than car traffic. With full grade separation, trolleys could run very fast and frequent and make many stops in dense neighborhoods without interfering with traffic at all.</p> <p>I strongly believe that a Mid-City trolley line should be built first. If successful, it would convince taxpayers that other rail lines are needed.</p>	
E4	Alexander Han	Sunrise Movement	<p>I am a volunteer with the Sunrise Movement. Every San Diegan deserves access to high-quality transportation and economic mobility, especially young people ages 24 and under and seniors. We urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under receive priority when Transit Fare Subsidies are allocated. Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region's equitable economic recovery. No-cost transit passes for all youth ages 24 and under ensures generations of lifelong transit riders are part of our long-term strategy to build a greener and equitable San Diego. No-cost transit passes will connect youth to school, work, medical care, internships, and other early-career opportunities. Programs like these exist with great success in Alameda County, Boston, San Francisco, and most recently Sacramento and Los Angeles. I urge the board to take bold action to build a greener, healthier, prosperous, and just future in San Diego. Please amend the Plan to include Youth Opportunity passes as a priority.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E5	Alicia Rodriguez	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative**</b></p> <p>Hola mi nombre es Alicia Rodriguez, y yo estoy muy contenta con los proyectos en El Cajon City, gracias por dejamos saber los planes para nuestra ciudad, y gracias por los apoyos para las familias de Bajos recursos. A mi me gustaria que tambien tuvieran mas programas para nuestros ninios y tambien para que pudieran hacer also con los Homeless que hay en El Cajon, porque hay muchos por todos lados. Gracias por todo. ***</p> <p>Hello. My name is Alicia Rodriguez, and I am very happy with the projects in the City of El Cajon. Thank you for letting us know the plans for our city, and thank you for support programs for families with low economic resources. I also liked that it had more programs for our children, and also they could also do something about our homeless in EL Cajon, because there's so many everywhere. Thank you for everything.</p>	<p>Gracias por su comentario. Favor de continuar siguiendo el plan regional a: <a href="https://www.sdfoward.com/mobility-planning/2021-regional-plan">https://www.sdfoward.com/mobility-planning/2021-regional-plan</a>. ***</p> <p>Thank you for your comment. 			<p>alternative transportation solutions that do not harm the environment and are inclusive to all citizens of San Diego. As current trends demonstrate, our dependence on fossil fuels has caused irreversible damage not only in California but on a worldwide scale.</p> <p>We now have the opportunity to prevent further destruction of our atmosphere, coastlines, and wildlife by investing in renewable sources of energy. This step is vital to ensure that the precious monuments of our civilization, which we have spent centuries building, can withstand the impending challenges of climate change.</p> <p>If we do not invest in the research and development of more efficient, sustainable, and inclusive transportation, we will pass down the increasingly destructive burdens of air pollution and global warming, just as our predecessors have done to us. In addition to this, increasing fuel prices have exacerbated preexisting economic inequities, which may soon render cars, buses, and airplanes a luxury for those who can afford it, despite being a necessity to most people in the United States.</p> <p>I urge you to hear our case against current means of transportation in the city of San Diego so that this great city can lead the way for the widespread change that is necessary to begin repairing anthropogenic damage to our environment.</p>	<p>Adaptation Planning, which include prioritizing resilience and developing innovative solutions. Appendix B describes both Near-term and Continuing Actions for 2021 Regional Plan implementation, integrating a resilient capital grants and innovative solutions program, preparing a regional resilience framework, and serving as a resource for local agencies' Climate Action Planning efforts and the general public on the impacts of climate change. Additionally, the 5 Big Moves will enhance connectivity and result in people having more travel options and operating solutions, reducing per capita VMT.</p>
E8	Amy Huie	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E9	Amy Krajec		<p>I am an Oceanside resident. I work in Healthcare. My office is home-based and I travel in my own car to hospitals, clinics, Dr. offices etc., for work. I have a large territory and can drive up to 1000 miles per month just for work. I provide education to nurses and staff to allow them provide care to their patients. I think this fee is ridiculous and double dipping. We already increased taxes on gas to help pay for roads and infrastructure. We are already taxed to death and do not need further taxes.</p> <p>Also with healthcare, we have pushed care outside of offices, hospitals etc. and patients go home and have home health, wound care, physical therapy and other treatments at home. These healthcare providers have to use their own vehicles to care for these patients and now you want to add fees for them as well as myself to do our jobs which is caring for others. Usually we drive larger cars to hold all of the equipment we need to take to care of patients. Will those of us who do these types of jobs get some sort of rebate or reimbursement for the miles we travel to provide care/education? We shouldn't get punished because we have to drive to facilities or patient's homes to provide services.</p> <p>This fee will have a large impact on the outpatient Healthcare community. May find less employees who want to do these jobs due to being charged for driving, companies/insurance companies charging more for services due to having to pay higher wages to help offset the cost for employees.</p> <p>This fee is not a good idea and shouldn't be put in place. Until all the money we already pay in taxes for roads and infrastructure gets used for these things, we should not be adding anymore.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.</p>
E10	Ana Ierlick		<p>Every San Diegan deserves access to high-quality transportation and economic mobility, especially young people ages 24 and under and seniors. We urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under receive priority when Transit Fare Subsidies are allocated.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway,</p>

			<p>Choose 2 talking points to include:                      Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region’s equitable economic recovery. No-cost transit passes for all youth ages 24 and under ensures generations of lifelong transit riders are part of our long-term strategy to build a greener and equitable San Diego. No-cost transit passes will connect youth to school, work, medical care, internships, and other early-career opportunities. Programs like these exist with great success in Alameda County, Boston, San Francisco, and most recently Sacramento and Los Angeles. I urge the board to take bold action to build a greener, healthier, prosperous, and just future in San Diego. Please amend the Plan to include Youth Opportunity passes as a priority.</p>	<p>staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E11	Andrea K. Hetheru	Southeast Neighbors Together (SENT)	<p>A Mobility Hub in our community preferably located at our current Orange Line Trolley station.</p> <p>Youth pass given to youth to age 24.</p> <p>Fiber optics underground to ensure we are ready for the state of the art Transportation System that is in the design stage, (IOS system/smart phones) and to more appropriately address the digital divide in our “Redlined communities”</p> <p>Covering on our MTS bus stops (structures).</p> <p>Consider 24 hour service on the lines that are taking our residents to work.</p> <p>Focus on transitioning to an all electric buses in the first 2-3 years of implementation.</p> <p>Improve the frequency and reliability of our bus routes.</p> <p>Ensure all of our streets are designed with the “Complete Streets” designs.</p> <p>Increased maintenance of the trolleys and busses proportionate to the heavy usage in our areas (southeast area of the city of San Diego).</p>	<p>The proposed final 2021 Regional Plan identifies three Mobility Hubs along the Orange Line Trolley in Lemon Grove, La Mesa, and El Cajon. You can visit <a href="https://sdforward.com/envision">SDForward.com/envision</a> to see more details about proposed projects in your community.</p> <p>One of the Regional Plan’s near-term actions includes developing a Digital Equity Strategy and Action Plan that will address regional accessibility gaps in communications infrastructure, technology, and digital literacy. For more information, please refer to Appendix B: Implementation Actions and the Digital Equity Strategy and Action Plan.</p> <p>Bus shelters are provided wherever there is sufficient right of way to locate them. Any new infrastructure build would include shelters. Complete Streets designs are an important component of SANDAG’s planning today and will be included on projects in the future. As part of larger infrastructure projects like Next Generation Rapid, Trolley and Commuter Rail, all stations will have shelters.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>The proposed final 2021 Regional Plan supports the electrification of the region’s transit buses and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>The 2021 Regional Plan also proposes transit fare subsidies for youth, increased frequencies and spans of service on core bus routes, high frequencies and all-day service on new Rapid and Commuter Rail routes, investments in zero emission buses and charging/fueling infrastructure, and investments in complete streets and Vision Zero programs.</p>
E12	Andrea Smith		<p>A Mobility Hub in our community preferably located at our current Orange Line Trolley station.</p> <p>Youth pass given to youth to age 24.</p> <p>Fiber optics underground to ensure we are ready for the state of the art Transportation System that is in the design stage, (IOS system/smart phones) and to more appropriately address the digital divide in our “Redlined communities”</p> <p>Covering on our MTS bus stops (structures).</p> <p>Consider 24 hour service on the lines that are taking our residents to work.</p>	<p>Through this framework, one of the plan’s near-term Implementation Actions listed in Appendix B will be a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, students, and youth. SANDAG also is currently working with the Social Equity Working Group to develop near-term solutions to address transit service improvements, amenities, and subsidized transit fares. Another near-term action of the Regional Plan includes developing a Digital Equity Strategy and Action Plan that will address regional accessibility gaps in communications infrastructure, technology, and digital literacy.</p> <p>For more information on the Regional Fare Impact Study and Digital Equity</p>

				will be launched in 2022 to test different applications for Flexible Fleets. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E17	Anne Sheridan	SanDiego350	I want to thank you for including climate and equity concerns in the Regional Transportation Plan draft. However, we need a plan that public transit system a meaningful alternative to cars. That means improving the frequency of service and speeding up the addition of new bus and trolley lines. I would also like to see no cost youth passes implemented sooner.	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E18	Annie Hafer	SanDiego350	<p>I am so happy to hear about transportation updates happening. Thank you to the SANDAG staff for their strides in addressing climate and equity in this Regional Transportation Plan draft.</p> <p>I am someone who does not have a vehicle and relies on public transportation. That combined with the urgency of the climate crisis the need for these updates is not moving fast enough to give those reliant on transit the relief we need.</p> <p>I kindly ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>The planet and the people can't wait.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E19	Anthony Hamm	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E20	aPebbleInYourShoe	N/A	I do not understand why SANDAG says we need to spend all this money "grade separating" the trolley when in fact it already gets priority at a traffic light. I've never seen it stopped for cars. Cars stop for the trolley. So SANDAG talks about this being about VMT and then goes and proposes spending billions to elevate the trolley out of the way of cars. How is this making sense except in a few cases at most ? Maybe this helps a few local bus routes but let's be honest this sounds like mostly a benefit to cars (maybe pedestrians, but there has to be a cheaper way to address that)	There are several circumstances where the Trolley must wait for traffic signals to proceed (e.g. downtown San Diego) which impacts operating speed and reliability. Moving rail off the street network enables for much faster running times and higher-speed trips which are competitive with driving. Grade separations also have safety benefits by removing conflict points between rail transit, vehicles, pedestrians, and cyclists.
E21	Araceli Hernandez	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative**</b></p> <p>Solicitar mas limpieza en las paradas de autobus. Hay demasiados carros estacionados en las calles por meses en los mismo lugares, quiza una</p>	<p>Su comentario ha sido compartido con MTS y la ciudad de El Cajon. *** Your comment was forwarded to MTS and the City of El Cajon.</p>

			<p>revision mas constante.                      Renovacion de carretera Main St. algunas partes estan muy viejas.                      ***                      Clean the bus stops more often.                      There is too many cars parked in the streets for months in the same location, I want more consistent revision.                      Renovations for Main Street, some parts are very old.</p>	
E22	Armin and Rhea Kuhlman		<p>Please focus on equity and environmental justice in the Regional Plan projects.</p> <p>This is a great opportunity move forward to meet the needs for affordable, accessible transportation for jobs, healthcare and education in underserved communities.</p> <p>Please include an equity specific project list in the RTP Appendix A: Transportation Projects, Programs and Phasing document.</p> <p>A fast, reliable and affordable bus system with increased frequency is vital on popular lines and overcrowded areas.</p> <p>Improve the Blue Line track with express 24 hour service and additional frequency.</p> <p>The Purple Line needs planning and funding to connect central City Heights and South Bay to Sorrento Valley.</p> <p>Thank you for your attention to these environmental and transportation justice priorities in the RTP.</p>	<p>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</p>
E23	Arysa Gonzalez Romero, M.S., RPA.	Agua Caliente Band of Cahuilla Indians	<p>A records check of the Tribal Historic preservation office’s cultural registry revealed that this project is not located within the Tribe’s Traditional Use Area. Therefore, we defer to the other tribes in the area. This letter shall conclude our consultation efforts.</p>	<p>Thank you for your comment.</p>

E28	Barbara Ryan	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>I participated in the Collaborative Meeting and was very pleased to hear the SANDAG Transportation Plan. Good plan. Well represented.</p>	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E29	Barry Bernstein	UCCA pres.	As part of our new community plan I would like SANDAG to include in their optional plans to consider what has been titled the grand compromise. It is based on SAFETY IN U.C./Clairemont and La Jolla. Basically it is an emergency vehicle only bridge connecting North and South U.C. over the existing RR TRACKS at the Regents end points. It would serve and meet the City plans for safe bicycle and pedestrian modes, and provide access only to emergency vehicles serving the three above mentioned communities. No regular traffic...and would also provide an evacuation option that may not exist due to the congestion on Genesee, the only north/south artery on U.C. Thank you for giving this planning option your consideration.	<p>Your comment and the concept of an emergency only connection of Regents Road across Rose Canyon has been shared with San Diego County Office of Emergency Services. The County's Operation Area Emergency Operations Plan was last updated September 2018.</p> <p>Your comment was forwarded to the City of San Diego.</p>
E30	Benjamin Martinez	SanDiego350	While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. E31	Bill Sutton	Catholic Charities/El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>I am really excited about the plans that you presented regarding SANDAGs long-term vision for the community and San Diego county. It was well presented and included great details in a well throughout plan from this organization. Thank you for sharing with the members of East County Collaborative. It was well received and appreciated.</p>	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E32	Billy Abston		<p>In reference to this story. No new taxes. Also, where in the heck do I leave a public comment? Seems buried. The sandag.org pages isn't very mobile friendly.</p> <p>Grumble. Grumble. Grumble. Not very helpful web page. :(</p> <p><a href="https://www.nbcsandiego.com/news/local/another-tax-for-san-diegans-sandag-considers-mileage-tax-for-drivers/2685884/">https://www.nbcsandiego.com/news/local/another-tax-for-san-diegans-sandag-considers-mileage-tax-for-drivers/2685884/</a></p> <p>--</p> <p>Computer Science is the science of solving problems using computers, that we wouldn't have if we didn't have computers.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. While the design of the program has not yet been determined, initial assumptions included in the Regional Plan is that the regional road usage charge would be a user-fee for use of roads in San Diego County. So a San Diego County resident would not be charged a San Diego user fee for miles drive in other counties, and residents of other counties would be charged for miles driven in San Diego county. SANDAG will rely on coordination with other agencies in California along with the State Department of Transportation to integrate the selection of technology, collection methods, and account management to ensure a consistent experience for travelers.</p>
E33	Brendan Bartnik	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on public transit the relief they need.</p> <p>In addition to this please move toward a 24 hour public transit system. This city deserves round the clock access to core transit lines. Perhaps once an hour or 90 minute intervals but the dead time between 12 and 5am makes for occasionally difficult planning for travelers.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p>
E34	Breton Peace	March and Ash	<p>Our business, March and Ash, a licensed cannabis retail outlet, is located in the City Heights community near the corner of Home and Fairmount, and close to the I-805 Freeway Home Avenue ramps. We began construction of this site in 2019 and opened in mid 2020.</p> <p>This project represented a significant investment for our company into a property that was formerly an auto repair shop. We are proud of the work we and our partners have concluded, and are especially proud that this is the location for our founders that is closest to where we were born and raised in El Cajon.</p> <p>Having partnered with our neighborhood businesses, we've taken concrete steps to improve the facilities, sidewalks, bust stops and open spaces that comprise our "block". We understood the challenges and opportunities of revitalization when we pursued this project, and are committed to seeing truly localized revitalization occur.</p> <p>We know the travel patterns of our customers at our retail outlet and the surrounding businesses,</p>	<p>While Home Avenue is not on the Adopted Regional Bike Network, the 2021 Regional Plan includes the nearby and parallel Chollas Creek Bikeways: North Fork - Bayshore Bikeway to University Bikeway and South Fork - Petway Park to Market Creek Plaza which will improve the connections described in this comment. The project alignment and details can specifically be found in the updated data viewer and Appendix A. The City of San Diego and Metropolitan Transit System are the implementing agencies for these improvements. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is in development and provides another opportunity to provide input on transportation solutions for this area. Establishing special districts is under the purview of the City of San Diego.</p> <p>Your comment was forwarded to the City of San Diego.</p>

			<p>including the stacking of traffic at the freeway off and onramps and at the intersection of Home and Fairmount. Local neighborhood traffic utilizes longer direct freeway trips to and from the Mt. Hope community and the Gateway employment and shopping centers, as well as our business. Buses, Bicycles, vehicles, and pedestrians cannot go directly to Market Street.</p> <p>The Fairmount Park, Azalea Park and Hollywood Parks residents are cut off from the Gateway Centers jobs, visiting deceased loved ones at the Mt. Hope cemeteries, and the significant shopping areas between the I-805 and the SR-15 freeways.</p> <p>To do more we need the support of governmental authorities in pressing for structural changes that will further open up this area to the opportunity for further revitalization by eliminating congestion and creating the conditions for a City Heights business corridor that surrounds and can cross the 94, while improving the residential areas we serve.</p> <p>Our experience to date is that governmental authorities have looked at this area with too narrow of a focus. This area presents a great opportunity for smart community oriented revitalization on corridors (Home up Euclid) that are already predominantly occupied by locals ready and willing to make this happen.</p> <p>Our list of priority projects for our D9 /D4 are as follows:</p> <ol style="list-style-type: none"> <li>1. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles, and Vehicles. The Home / Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94 - Martin Luther King Freeway.</li> <li>2. Completion of the Transportation markings along Home Avenue. Curbs are not marked for safety, to promote proper parking, traffic movement, and access for Buses and the Disabled. The Bicycle route is not fully painted and warning ramps for the visually impaired are not in place. Bulbing out at key intersections should be funded to increase pedestrian crossing safety.</li> </ol> <p>We believe that the business community along Fairmount and Home Avenues would be open to the establishment of a Business Improvement and Maintenance Area to assist in cooperative funding of some of these improvements.</p> <p>While some have pressed for the establishment of a business improvement district City wide to support marking the cannabis industry we firmly believe that our economics would be better rooted in this type of neighborhood oriented business district - if the opportunity presented itself to establish the same.</p> <p>We would appreciate assistance in establishing such special districts.</p> <p>As one of the more controversial businesses in the area when we entered, we have a hyper focus on what matters to our neighbors. This matters and we will be a willing partner.</p>	
E35	Brett McIntosh	N/A	<p>I highly oppose this “proposal” and I’m sure a lot of citizens feel this way as we are already one of the highest taxed states in this country. This new tax is not for the citizens of this state. This proposal shouldn’t have even been drafted because it is ludicrous. Vehicle registration is insanely high , gas prices are insanely high , income tax is insanely high , consumer taxes are high. We are literally taxed multiple times per dollar we earn and spend. This proposal is a no for me. I’ll be making sure this email address is publicly available for everyone to voice their opinions. Thank you.</p>	Thank you for your comment.
E36	Brian Janey	Allegro Piano Service, Inc.	<p>I have been following news with some interest in regards to a proposal before SANDAG to impose an additional tax on miles driven. I do hope you pass my concerns on or perhaps direct them to the appropriate place.</p> <p>I live in the rural unincorporated town of Fallbrook where applying an extra tax on miles driven</p>	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing

			<p>would be a unfair burden. I run a service business that services many in the rural areas of north county and I may spend 2+ hours a day driving. Taking some kind of public transportation is not an option in my line of work.</p> <p>Imposing such a tax on those in rural communities to fund projects that clearly favor urban areas is just wrong. I have many clients that live in more affordable, rural outlying areas and bedroom communities that commute that no doubt would also find such additional taxation unsavory.</p> <p>SANDAG needs to focus on making main arteries of road travel more free flowing and ensure an even hand in the spending of funds collected in taxation that do not unfairly punish those in more rural areas.</p>	<p>revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.</p>
E37	Brian Krohne	SanDiego350	<p>Please prioritize public transit over roads. Public transit is just less convenient than a car for lot of trips right now, but if you made it more convenient that driving, more people would take it. Plus this give more mobility to people who don't have cars.</p> <p>Also - protected bike lines with physical barriers please. Painted lines are not protection.</p>	<p>The 2021 Regional Plan seeks to offer fast, safe and reliable transportation options for the San Diego region that make public transit a competitive alternative to personal vehicles. Investments in roads also support efforts to create complete streets and offer dedicated space to transit and people biking and walking.</p> <p>SANDAG follows national and international best practices in bikeway design to create safe facilities for users of all ages and abilities. Every project goes through a detailed and context sensitive design process which results in decisions regarding the best facility, which may include protected bikeways, buffered bikeways, shared use paths, or shared streets with significant traffic calming elements. The Regional Plan also includes funding for upgrading existing bikeways that may not meet current best practices in maintenance or bikeway design.</p>
E38	Briana C. Wills	Vista Hill - ADAPT/El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>Hello! I was extremely excited to hear about all of the various transportation plans that will be happening in the future for East County, especially. I appreciate all of the hard word that is going to be put into making transportation more accessible and efficient. I loved hearing that more scooters, shared rides and transportation outlets are coming into East County because I feel that we don't have enough of that here. I have lived here my whole life. I am also excited to hear about the new train and more frequent trolleys that will be coming to Downtown El Cajon. I would propose that there be more Park and Ride places in East County to cut down on car travel. I would also propose that some of the giant empty lots be used as community parking lots around central El Cajon. I also propose to put money and efforts into the local bus stops around El Cajon, and adding more scooter, bikes around the rural El Cajon areas and not just in the middle. I also feel like transportation costs for at risk persons should be low or none; those struggling with mental illness, single parents, low income individuals. Thank you!</p>	<p>We appreciate your support and feedback regarding mobility improvements in El Cajon. El Cajon is on the of the areas identified as a Mobility Hub area in the proposed final Regional Plan. SANDAG looks forward to working with the City of El Cajon, community members, and other community stakeholders to identify mobility improvements such as the ones mentioned in your comments to better connect the local community to public transportation. The proposed final Regional Plan includes a Regional Transit Fare Impact Study as a near-term implementation action that will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
E39	Bruce Higgins	N/A	<p>The aftermath of the COVID epidemic has left our region in a state of flux. Many things are uncertain, how will the reopening go? Will the hospitality industry be able to find sufficient workers to fully reopen? What is the state of the traditional office workers, particularly downtown? Is what we are seeing temporary, just an artifact of the reopening process or is it a permanent change in our relationship to work? How will all of this effect our transportation needs going forward?</p> <p>I would submit that SANDAG's grand vision could be out of date given the changes that are happening now. It is too expensive, it has too many long-term consequences to take a chance on during a period with this much uncertainty. If the plan and its bond funding is submitted for approval this November, I believe it will go down to defeat by a large majority. I would strongly urge you to delay this plan until at least 2022. Gauge the effects of the changes, and how that impacts our transportation needs. It may be that changes will be required to the plan, admitting that and submitting a revised plan that accounts for those changes will gain back some of the credibility SANDAG lost in its previous "Bait and Switch" stunt on the last bond plan.</p>	<p>The 2021 Regional Plan is a long-range planning document and is required by federal law to provide a reasonably feasible funding strategy for the projects, policies, and programs of the plan. Significant additional work, including public involvement, pilot testing, legislation and much more will be necessary to inform implementation of elements of this plan. At a minimum this plan is updated every four years with the latest in planning ideas and concepts.</p>

E40	Bryan Pate	ElliptiGO, Inc.	As a North County resident, I support the 2021 Regional Transportation Plan. It is important to me that we reduce greenhouse emissions for a cleaner environment and provide clean rapid transit for people of all ages connecting ALL of San Diego. I support timely rapid transportation for all San Diego County community members who support San Diego's business community.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E41	Candelaria Rojas	N/A	Transportation publica.  ***TRANSLATION*** Public Transportation.	Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E42	Candy Garner	Bayside Community Center	<b>**Comment Submitted via Bayside Community Center**</b>  Yes. I agree with the Plan of Zero Emissions, because the environment needs all the help we can offer. I feel safe when walking on the sidewalk or when crossing a street. We definitely need more bus routes if anyone wants the public to use more public transportation.  The street quality. The streets are in poor condition with so many pot hole, one can't miss them at all. Better maintenance is required. To improve our transportation system with the CMCP, more mini MTS busses to more locations are needed.	SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E43	Carlos Alessandrini	FHCSD/El Cajon Collaborative	<b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b>  Excited about a greener, connected and more reliable public transport system in SD. Thank you Carol!	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E44	Carole Morales		I live in East County and public transportation is not easy.  Environmental justice must be embedded in our mobility in San Diego. Therefore, I ask that the 10 Big Moves to Transportation Justice be included in the 2021 Regional Transportation Plan. I call for an environmental justice centered RTP to ensure the projects included in the RTP will prioritize environmental justice (EJ) communities identified by CalEnviroScreen (CES) by listing projects that will directly benefit EJ communities, outlining immediate benefits via projects that will be implemented by 2025 in EJ communities, and making all public communication easy to understand by the public in order to promote meaningful engagement.  Therefore, in the RTP, I ask that an equity specific project list be included in Appendix A: Transportation Projects, Programs, and Phasing document. I call for an improvement in the bus system now that is fast, frequent, reliable, and accessible through increasing frequency on popular lines, especially overcrowded ones.  Therefore, I call for more clarity in Appendix A: Transportation Projects, Programs, and Phasing that provides a list of specific improvements to the bus system. I call for increased funding for the planning, environmental review, engineering, and capital for the additional Blue Line track that allows express, 24-hour service, and additional frequency enhancements. The information for the Blue Line needs to be clarified; it is unclear if the double/third tracking included in Appendix A refers to an additional track that will provide express connectivity from the border to downtown San Diego.  I call for a 24-hour service by 2025 on popular transit routes to connect late night and early morning workers to their job. Therefore, the information in the RTP needs to be clarified; the language in both Appendix A and Chapter 2 should specifically call for 24 hr. service on popular transit routes and present a clear implementation schedule. I call for the funding of the planning, environmental review, engineering, and capital for the Purple Line as a rail line that connects EJ communities in Central City Heights and South Bay to Sorrento Valley. According to SANDAG staff, the alignment includes City Heights in the 2050 RTP with a 2035 implementation. However, it should be listed in the document to demonstrate that project phasing prioritizes central City Heights and the South Bay region, and a 2035 completion I call for no-cost transit passes for all youth 24 years old and	The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050

			<p>under in order to ensure generations of lifelong transit riders and encourage significant mode shift.</p> <p>Further, I ask that it be accelerated for a 2035 implementation rather than the current delayed plan to implement in 2027. I call for an electrified bus fleet by 2030. Fund the implementation of California's Innovative Clean Transit rule to accelerate the electrification of the bus fleet ten years before mandated by the California Air Resources Board. We cannot afford to wait 20 years to reduce GHGs. Therefore, I ask that the transition to zero-emission buses be accelerated for a 2030 completion with the support of recently approved state and federal funding sources.</p> <p>I call for the funding of to protect vulnerable communities living near transit corridors by anti-displacement efforts developing an anti-displacement strategy that includes affordable/low-income housing and preservation of naturally occurring existing affordable housing, community ownership, and tenant protections. Therefore, I request an update on the status of the anti-displacement study.</p> <p>I call for the development of a bathroom access plan and providing MTS with funding for a clear and accessible bathroom network open at all major transit stations. It is unclear if a bathroom network is included in the capital operations budgets. I call for the funding of the planning and implementation of a transit emergency response strategy to provide safety particularly to EJ communities during community-wide emergencies. Currently, this is not included in the RTP.</p>	<p>along with a branch to the Central Mobility Hub via downtown San Diego. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under. The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG's specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.</p>
E45	Cecilia Villarreal Torres	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative**</b></p> <p>Pues yo estory muy contenta y agradecida por tomar en cuenta a las personas que como yo no manejamos y asi con estos nuevos proyectos nos facilitan las cosas, y sobre todo a generar ingresos para la ciudad de El Cajon. Y también la facilidad de poder transportamos a otros lugares, muchas gracias. ***</p> <p>Well, I and very happy and grateful to be counted amongst the persons, who like myself, do not drive. And with these new projects they provide us with things, and regarding everything, they provided more revenues for the City of El Cajon. And also, the ability to transport ones self to other places. Thank you.</p>	<p>Gracias por su comentario. Favor de continuar siguiendo el plan regional a: <a href="https://www.sdfoward.com/mobility-planning/2021-regional-plan">https://www.sdfoward.com/mobility-planning/2021-regional-plan</a>. *** Thank you for your comment. Please continue to follow that 2021 Regional Plan at: <a href="https://www.sdfoward.com/mobility-planning/2021-regional-plan">https://www.sdfoward.com/mobility-planning/2021-regional-plan</a>.</p>
E46	Charles Ross	n/a	<p>RE: 2021 Regional Plan Insanity</p> <p>I am opposed to the 2021 Regional Plan ideas regarding expanding public transit (homeless transportation for them to travel freely to homeless camps for drug use) and taxing vehicles by the mile (we already pay extreme gas and other taxes to build new roads all the time but don't) to fund overpaid union contractors (prevailing wages). I will work with other groups, talk radio and community organizers to aggressively fight these idiotic ideas that really are giveaways to developers to build high-density projects around mass transit that no one wants, and virtually no</p>	<p>The 2021 Regional Plan includes an expanded network of public transit to provide more transportation options to current and future residents of the region. Gas tax revenues have been declining as vehicles become more efficient and more electric vehicles are on the roads. The road usage charge would be a new funding mechanism to replace the gas tax. Building more infill development near transit offers options for people that are looking for more affordable housing and the ability to live without the expense of car ownership.</p>

E51	Cindy Page	Crawford High School; Mid-City CAN	<p>I am a teacher at Crawford High School and a supporter of Mid-City CAN. Every San Diegan deserves access to high-quality transportation and economic mobility, especially young people ages 24 and under and seniors. We urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under receive priority when Transit Fare Subsidies are allocated.</p> <p>Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region's equitable economic recovery.</p> <p>No-cost transit passes will connect youth to school, work, medical care, internships, and other early-career opportunities.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>

			I urge the board to take bold action to build a greener, healthier, prosperous, and just future in San Diego. Please amend the Plan to include Youth Opportunity passes as a priority.	
E52	Clif Williams	LATHAM & WATKINS LLP	Is the North University City area (Golden Triangle) considered a Major Employment Center in the 2021 Regional Plan? I'm pretty sure it is, since it is part of the Sorrento Valley Employment Center which is the largest employment area in the County. But is there any place where the Community Plan areas are listed with their designation? Or somewhere where this is mentioned in an appendices to the Regional Plan.	Responses to comments received during the public comment period for the draft 2021 Regional Plan will be included in the proposed final 2021 Regional Plan anticipated for release in late 2021. More information on the Employment Centers: Live/Work Data can be found at: <a href="https://www.sdfoward.com/economy-jobs/data">https://www.sdfoward.com/economy-jobs/data</a> .
E53	Dan Gallagher	N/A	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. E54	Dan Summers	Ramona State Routes Subcommittee	I'm Chairman of the Ramona State Routes Subcommittee. We support the completion of the San Vicente Corridor which will serve well over 50,000 "back country" residents. The TransNet tax funds were supposed to improve SR 67 32 years ago, but the funding was transferred to the coast for trolleys and transit lines that have a 3% occupancy rate. We want to make our voices heard. Unfortunately, we were not aware of the July 7th meeting in which funding priorities were discussed. However, even though we missed the meeting, we still want to make comments on the topic. So I will advise my committee members to send their comments to your email address unless directed otherwise.	<p>When <i>TransNet</i> was adopted the anticipated future land use pattern included significant development in east county. Those developments are no longer expected due to expanded land preservation, slower regional growth rates, and state regulations focusing development near existing facilities. Many of the <i>TransNet</i> projects that have not yet been built were designed to support the East County growth that has not happened and is no longer anticipated.</p> <p>The 2021 Regional Plan includes mostly safety improvements in the rural areas to address crashes and evacuation needs in the event of wildfire or other disasters. SANDAG has recently been exploring opportunities to improve broadband internet connectivity and has begun a project in partnership with Caltrans and the County of San Diego to expand fiber connectivity for high speed internet access on the State Route 67 corridor to Ramona. SANDAG and Caltrans also are currently working on the San Vicente Comprehensive Multimodal Corridor Plan to identify transportation projects to improve mobility along the SR 67 corridor. Additionally, Caltrans is currently working on a draft environmental document for SR 67 which will explore multimodal transportation options to improve mobility and safety. We appreciate your participation in these efforts.</p>
E55	Danny Fuchs	SanDiego350	<p>Thank you SANDAG staff for creating this RTP. It is definitely supporting the direction we need to move in to reduce our climate impact.</p> <p>In addition to the plan you've already established, I would like to see extended/late hours for the Coaster (going back to north county) and trolley added, as well as, more train times added on the weekends.</p> <p>If I am flying back to San Diego at night during the week and I arrive after 7/8p, it's almost impossible to take public transit back to north county and I, and many others, end up having to catch an Uber/taxi.</p> <p>Furthermore, since the Coaster only has 6 trains that run on Saturday to downtown San Diego, I usually end up driving down because the times don't align with my schedule.</p> <p>Adding late night trains to north county and more Coaster times during the weekend I think would significantly reduce the amount of cars on the road and allow more people to take public transportation reducing our overall emissions.</p> <p>Thanks for listening and thank you for your hard work you all put into this plan.</p>	The Regional Plan includes both increased frequency of COASTER service and greater service throughout the day. The Central Mobility Hub will provide a quick and convenient transit connection to the airport so that catching the train for airport trips can be made much easier. The Regional Plan includes a significant capital investment in the LOSSAN rail corridor increasing capacity and speeds that lead to more frequent, reliable, and faster Amtrak and COASTER service including on nights and weekends.

## Draft 2021 Regional Plan Responses to Comments – Email Sourced

ID	Commentor Name	Agency	Comment	Response
E56	Danny G	N/A	<p>I am unable to find on the website for public comment for the mileage tax.</p> <p>But as a resident of San Diego County I'd like to make the statement for public comment:</p> <p>Mileage tax for cars are you kidding me? I understand this may replace some of the gas tax due to electrical vehicle usage and try to encourage more public transportation usage. But many people have bought electric vehicles because gas has become unaffordable. Many people live 20 + miles from work. Secondly to enforce will be difficult. This tax will Target people who rely on cars for their livelihood. For public transportation people such as myself where I work would take 2 hours to get there plus I have to pick up kids at daycare. This would make a 45 minute car ride home possibly 3 hours via public transportation.</p> <p>Solution: make the gas tax lower, then less people will then drive electric cars or Increase registration fees for cars. Making the fee equal for all and not just people who live closer to work or daily life.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. While the design of the program has not yet been determined, initial assumptions included in the Regional Plan is that the regional road usage charge would be a user-fee for use of roads in San Diego County. So a San Diego County resident would not be charged a San Diego user fee for miles drive in other counties, and residents of other counties would be charged for miles driven in San Diego county. SANDAG will rely on coordination with other agencies in California along with the State Department of Transportation to integrate the selection of technology, collection methods, and account management to ensure a consistent experience for travelers.</p>
E57	Darrell Wenhardt		<p>Why is there no plan for Rail up the 15 corridor?</p> <p>This plan ignores communities like Scripps Ranch, Poway and alike.</p>	<p>Current data and modeled projections show that there is not enough demand to warrant the more costly rail for that section of the corridor. Busses and Flexible Fleets can better serve those areas.</p>
E58	Dave Robertson	SDGNDA	<p>I hope SANDAG will amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth (ages 24 and under) receive priority when transit fare subsidies are allocated. Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region's equitable economic recovery. Additionally, no-cost transit passes for all youth ages 24 and under ensures generations of lifelong transit riders are part of our long-term strategy to build a greener and more equitable San Diego.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E59	David Harris	SanDiego350	<p>I commend the planning staff and leadership at SANDAG for proposing a visionary transit system with multiple modes to make commuting without a personal vehicle more efficient and convenient. However, I am concerned that the plan still builds highways first and schedules public transit projects too far out in the future. Instead we need an enhanced transit system that is more frequent, reliable, accessible and will lower Greenhouse Gas emissions. This needs to happen within the next 10 years, not thirty years.</p> <p>I recommend that SANDAG accelerate the timeline for all transit (trollies, buses, rail) and biking infrastructure improvements. In the interest of equity, the RTP should prioritize the Environmental Justice communities that need transit solutions the most. Environmental Justice communities cannot afford to wait; they need immediate improvements while the long-term infrastructure projects are being planned.</p> <p>Finally, I am in favor of locating the central mobility hub and airport people mover at the Navy site, as long as it does not substantially delay the timeline for development of the project.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. SANDAG is currently studying the potential impacts of developing the Central Mobility Hub in an Environmental Impact Report (EIR). The EIR will analyze all aspects of the project, including two potential locations for the Central Mobility Hub including the Navy's Old Town Campus, a Trolley extension alternative, a direct transit connection to the airport, and improvements to local roads and highway access. Learn more about the Central Mobility Hub at: <a href="https://sandag.mysocialpinpoint.com/CentralMobilityHub">sandag.mysocialpinpoint.com/CentralMobilityHub</a>.</p>
E60	David Oddo		<p>I would like to request a printed (color) copy of the following document:</p> <p>"Appendix H. Social Equity: Engagement and Analysis, San Diego Regional Plan 2021."</p>	<p>A SANDAG staff member will be in contact with you regarding how to obtain a printed copy of the requested documentation. Appendix H: Social Equity: Engagement and Analysis can be viewed/downloaded on our website at: <a href="https://sdforward.com/docs/default-source/2021-regional-plan/appendix-h---social-equity---engagement-and-analysis.pdf?sfvrsn=c944fd65_2">https://sdforward.com/docs/default-source/2021-regional-plan/appendix-h---social-equity---engagement-and-analysis.pdf?sfvrsn=c944fd65_2</a>.</p>

				The full draft 2021 Regional Plan, including all chapters and appendices, can be found at: <a href="https://www.sdfoward.com/mobility-planning/2021-regional-plan-draft">https://www.sdfoward.com/mobility-planning/2021-regional-plan-draft</a> .
E61	David Smith		As a North County resident, I support the 2021 Regional Transportation Plan. It is important to me that we reduce greenhouse emissions for a cleaner environment and provide clean rapid transit for people of all ages connecting ALL of San Diego. I support timely rapid transportation for all San Diego County community members who support San Diego's business community. I would also like to see the transportation be affordable to those that depend on it, and are limited by cost.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfoward.com">SDFoward.com</a> .
E62	Dena Stark	Family Health Centers of SD/El Cajon Collaborative	<b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b>  It's been interesting to watch the process of the development of the upcoming transportation plans. It has been a long time coming and long over due. As a resident and employee of El Cajon, I am eager to see and use the transportation in the future. The community and environment will benefit from the Regional Plan.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfoward.com">SDFoward.com</a> .
E63	Dennis	N/A	Please stop spending money on trolleys that go very slow, and do no go to the airport. Spend the money on roads, and maintaining weed removal from sidewalks and medians. Sorrento Valley Blvd. and Sorrento Valley Road need repaved.	State laws have changed from requiring congestion relief (usually solved in the short term by widening roadways) to reducing vehicle miles traveled and greenhouse gas emissions (usually solved by people living closer to destinations and using alternative modes of transportation such as walking, biking, carpooling and taking public transit).
E64	Destiny Garcia	San Diego College of Continuing Education/El Cajon Collaborative	<b>**Comment submitted to SANDAG via El Cajon Collaborative**</b>  I really appreciate everything you're doing, as someone who works in education it is so important for me to stay up to date with the community and be informed of what changes to expect. I look forward to attending future meetings and working with you to possible provide further outreach to the community. It looks like a very comprehensive [plan] that will work for everyone.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfoward.com">SDFoward.com</a> .
E65	Diane Lopez Hughes		San Diego needs an environment justice centered RTP.  We need funding to protect vulnerable communities living near transit corridors by anti-displacement efforts developing an anti-displacement strategy that includes affordable/low-income housing and preservation of naturally occurring existing affordable housing, community ownership, and tenant protections. Therefore, I request an update on the status of the anti-displacement study.  We need funding the planning and implementation of a transit emergency response strategy to provide safety particularly to EJ communities during community-wide emergencies. Currently, this is not included in the RTP.  Thank you for the opportunity to share my concerns as a grandmother, retired nurse, and resident of San Diego.	The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.  Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.  MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG's specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.
E66	Diego Lynch	SanDiego350	While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.  We ask that you move faster in meeting targets for emissions reduction, transit projects, and the	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to

			hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.	reduce emissions beyond what is included in the 2021 Regional Plan.  Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E67	Donald L. Waggett Jr.		How can I obtain a paper copy of the regional draft plan?	A SANDAG staff member will be in contact with you regarding how to obtain a printed copy of the requested documentation. The full draft 2021 Regional Plan (including all appendices and chapters) is available for view/download on our website at: <a href="https://www.sdforward.com/mobility-planning/2021-regional-plan-draft">https://www.sdforward.com/mobility-planning/2021-regional-plan-draft</a> .
E68	Edlinda Bailey	SanDiego350	While I appreciate the SANDAG's current regional transportation proposal, I want to share that I think it's important to be even bolder in ensuring that our region prioritizes efficient, reliable and environmentally conscious plan. We have very diverse industries here and should have transportation meet the needs of the community with forward thinking while also prioritizing environmental issues. For example, while I see that north coastal is finally getting a trolley stop @ UCSD, an expansion of this should really be considered to Escondido & Oceanside. Even if cars are going to be electric in the future if reliable transportation is available then, people won't feel the need to have vehicle ownership as important today. I ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.  The COASTER and SPRINTER will both be receiving much needed upgrades to operate more quickly and efficiently.
E69	EJ SHIRING	N/A	I just heard SANDAG is proposing a per mile tax for residents to collect EVEN more fees from the most heavily taxed drivers in the country!!! ARE YOU OUT OF YOUR FRIGGIN MIND!!!! The state just raised gas taxes AGAIN July 1 and now you want even more money!!!! For those of us with gasoline powered vehicles we are already paying for every mile we drive with the TAX on GASOLINE!!!!!! start spending responsibility and stop driving people out of the state who cannot afford to live and work here as you TAX THEM TO DEATH!!!	Thank you for your comment.
E70	Elaine Dorsey	SanDiego350	I am with San Diego 350.  I applaud SANDAG's leadership in transforming regional transit, but I am very concerned that the transit projects are so far in the future that they will not meet the urgent need to reduce GHG emissions soon enough to avert the worst effects of climate change.  Additionally, we need 24hr service with frequency of every 10 min on bus and trolley to meet needs of riders on the most popular routes.  Please address these issues in the RTP so that our public transit system can truly be a meaningful alternative to cars--highways should NOT continue to be the priority in the plan.	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.  Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E71	Elizabeth Chopp	SanDiego350	While I want to thank the staff at SANDAG for addressing climate and equity in this Regional Transportation Plan draft, there are still areas where improvement is necessary. One big issue I have also had with transit is that public transportation is OK if you are going downtown but not anywhere else. I live in the College and worked in downtown Chula Vista. Although it took me 25 minutes to drive, it would take 1 1/2 to 1 3/4 hours by transit. Better service, speed and frequency of transit is needed so that our public transit system can be a meaningful alternative to cars.	SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E72	Elizabeth Tate	Mid-City CAN	I am a volunteer with Mid-City CAN.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The

			<p>ridiculously, new invasive tax as well.                      A few years back I refused to allow State Farm to lower my bill by letting them track my mileage by reporting it to them. Where, when and how far I choose to drive is my business, paid for by buying my own vehicle and by paying the vast array of road/highway/gas taxes and charges already levied upon us as Californians. Being able to move around our community is a freedom we have always enjoyed. This taxation invasion of our driving freedom is even more invasive because it uses a tracking device attached to my private property. As decades long San Diegans, we do not want to move, but the more ridiculous tax pressures placed upon us, the closer we come to make moving a necessity.                      Please vote NO on this new tax scheme!</p>	<p>legislation and much more will be necessary to inform implementation of elements of this plan, including the road usage charge. At a minimum this plan is updated every four years with the latest in planning ideas and concepts. Further research will, and is currently, being conducted at the regional, state, and federal level on how to effectively implement these new funding options while safeguarding the public's privacy.</p> <p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p>
E79	Gloriani Weiss	SanDiego350	<p>I am humbly asking on behalf of the citizens of San Diego who along with Comic Con Attendees, Baseball fans and residents of the post populated of communities are screaming PLEASE PRIORITIZE PUBLIC TRANSIT!!                      That includes making it more affordable, and accessible to all.                      ***While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. E81	Halle Shilling		<p>As a North County resident, I support the 2021 Regional Transportation Plan. It is important to me that we reduce greenhouse emissions for a cleaner environment and provide clean rapid transit for people of all ages connecting ALL of San Diego. I support timely rapid transportation for all San Diego County community members who support San Diego's business community.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
E82	Haneen Mohamed	City Heights CDC	<p>Thank you all for taking the time to speak in depth with City Heights CDC staff on Monday about SANDAG's plan for managed lane expansions and general purpose lane conversions throughout City Heights. The conversation was highly informative and will help us better frame our ongoing community engagement and dialogue efforts with Mid-City residents, including the City Heights Built Environment Team.                      The Built Environment Team is a City Heights based community group that works towards achieving an equitable, accessible, and dignified transportation experience. Since the release of the draft 2021 Regional Plan in May, City Heights CDC has worked to engage the Built Environment Team in the public involvement process through disseminating critical information surrounding the Regional Plan. This includes preparing residents for the public comment opportunities offered at SANDAG's virtual public hearings and informational open houses, and through the Social Equity Working Group. Most importantly, City Heights CDC has utilized our monthly Built Environment Team meetings as an open forum for members to discuss the 2021 Regional Plan and continue refining their vision for transportation in the region.</p>	<p>Thank you for your comment and for supporting your community in facilitating their involvement in the development of the 2021 Regional Plan. The letter will be included in the public comments and responses as part of Appendix G in the proposed final.</p>

			<p>As an exciting product of these engagement efforts, the Built Environment Team has assembled a letter outlining their transportation priorities for the 2021 Regional Plan. If feasible, we would like to add the attached letter onto the agenda for tomorrow’s Regional Plan Social Equity Working Group meeting. We would also like to include this letter as part of public comment for the 2021 Regional Plan overall. If there are any specific avenues SANDAG would like us to share the letter through before the August 6th deadline, please let us know.</p>	
E83	Hannah Samuels	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn’t move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>Climate change is accelerating quickly and every day we are seeing new adverse effects. We need to start preparing now for what the future holds and do our best to try to lessen the damage we’ve already caused. The current plan to reduce emissions 40% by 2030 is not the assertive action that is needed. I urge San Diego to consider a bolder plan and to help lead the nation to a more sustainable future.</p> <p>Public transportation has the power to help so many people. However, the current transit system is unappealing to many. In order to encourage more community members to use the transit system, updates to the transit stops needs to be made to ensure equitable access to all. Benches, shade trees/elements, increased lighting, and ADA compliant bathrooms should all be considered and added. This will not only help increase ridership, but it will also ensure more equitable access to the transit system.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>MTS is working to provide shelters throughout the region. Bus shelters are provided wherever there is sufficient right of way to locate them. Any new infrastructure build would include shelters. Complete Streets designs are an important component of SANDAG’s planning today and will be included on projects in the future. As part of larger infrastructure projects like Next Generation Rapid, Trolley and Commuter Rail, all stations will have shelters. Additionally, the proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p>
E84	Hayden Schill	SanDiego350	<p>First, I’d like to thank the SANDAG staff the climate progress in the Regional Transportation Plan draft.</p> <p>However, given the urgency of the climate crisis, I want to encourage the staff to accelerate the goals outlined in the draft. Specifically, I urge you to move up the timeline for GHG reduction goals and transit improvements goals.</p> <p>Finally, I want to support no-cost youth passes for individuals 24 years old and younger. There are a plethora of “pros” for instating this.</p> <p>Thank you again for prioritizing climate goals, and I hope you consider this opportunity to be even more bold in the face of such a large crisis.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E85	Heather M Fenwick	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn’t move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>

E88	Ida Naughton	N/A	We are in a climate emergency and we need you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. This is an urgent matter and all of our futures are on the line.	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E89	Ivan Cavallino	SanDiego350	<p>Please build public transit. I live in Tierrasanta, which is a wasteland in terms of access to the rest of the city. There is a singular bus line out of the suburb and I live several miles away from it. There is only freeway access in and out of Tierrasanta, making leaving the suburb without a car not just a long trip, but also dangerous as traffic coming on and off the freeway is often far faster than residential traffic.</p> <p>It is clear that expanding freeways has not solved the issue of commutes in San Diego. Every afternoon through the evening traffic around my suburb prohibits most movement in and out via car, and there are no alternatives to get in and out of San Diego. Even if Climate change and reducing vehicle emissions is not a priority, lessening the commute car trips can only make freeways more accessible and usable to those that still use cars.</p>	The Regional Plan includes substantial increases in public transit. Both existing services and new services. That being said, Tierrasanta is difficult to serve for just the reasons cite. It is very suburban, spread out, and has very high auto ownership. A new transit route will connect to Tierrasanta on the west side of I-15 and Clairemont Mesa Boulevard.
E90	Jade L	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. 				<p>increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E91	James Long	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. I ride the Orange Line from Arnele to Civic Ctr. It takes 50 minutes. If you upgraded to include express trains with less stops, I can cut time to compete with car travel, because parking is a hassle downtown. If the express trains can reduce travel times, more people will give up cars and ride the train.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E92	Jamie Mark		<p>I am a resident of San Diego. I am writing in response to the proposed taxes and tax increases coming to San Diegans, including the State Mileage-Based Road User Fee, the Local Road User Charge, the Local Sales Tax Ballot Measure, and the MTS Sales Tax Ballot Measure.</p> <p>As someone who heavily relies on our roads for both livelihood and pleasure, I am emphatically against all four of these new taxes and any mandatory vehicular tracking technology. Not only does tracking private vehicles for tax purposes stifle freedoms, but the county (and state) have continually failed to live up to their promise to improve the roads with funding from other taxes, including the gasoline taxes, of which California has the highest in the nation.</p> <p>I am urging you to take these taxes and vehicular tracking technology off of the table, and to speak up for the right to move freely throughout San Diego County.</p>	<p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, and fair to all.</p> <p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>We understand there are concerns around the privacy and implementation of a road usage charge. There are several ways to implement a road usage charge without the use of tracking devices in personal vehicles. Significant additional work, including public involvement, pilot testing, legislation and much more will be necessary to inform implementation of elements of this plan, including the road usage charge. At a minimum</p>

				this plan is updated every four years with the latest in planning ideas and concepts. Further research will, and is currently, being conducted at the regional, state, and federal level on how to effectively implement these new funding options while safeguarding the public's privacy.
E93	Janet Castanos		I have worked over 40 years as an educator in San Diego. I strongly urge you to amend Appendix A of the 2021 regional plan to allow no-cost transit passes for all youth ages 24 and under. This change will help create generations of lifelong transit riders who become a part of our long-term strategy to build a greener and equitable San Diego. Our youth must grow up viewing mass transit as a way of life.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
E94	Jared Birrenkott		You guys and your tax proposals need to stop! We have had it, are fed up and willing to fight! Your not tracking my vehicle! I pay taxes when I get paid, taxed on gas, taxed on groceries, taxed when I buy a truck, taxed on my house, property tax, etc. I'm sure you see the point. We are sick of government overreach and constant taxes!	Thank you for your comment.
E95	Joan Raphael	SanDiego350	While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. I have a 2 year old grandson who will inherit the Climate Change Crisis. We need to move faster than you are proposing! We also need 24 hour transit. When my adult son was a teenager, it was taking him two hours on the bus to reach school that was 20 minutes away by car. We need to stop putting freeways first! We need transit that is easy to reach, at times we need it. Please think more boldly than this current plan!	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E96	Joanne Gonzalez	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative**</b></p> <p>Very thankful for all the information given to us. I learned so much I wasn't aware of and I think the plan in progress for the El Cajon community is going to be great and very helpful for many of us. What I look forward to the most and hope we get is the free shuttle service, it will be a huge help to many.</p>	Thank you for your comment. Please continue to follow that 2021 Regional Plan at: <a href="https://www.sdforward.com/mobility-planning/2021-regional-plan">https://www.sdforward.com/mobility-planning/2021-regional-plan</a> .
E97	Joe LaCava	District One, City of San Diego	<p>I am writing this letter to request changes related to the City's Coastal Rail Trail Project included in the draft 2021 Regional Transportation Plan (RTP).</p> <p>SANDAG's Draft 2021 RTP is a valued report for my constituents and the surrounding community. I value the hard work that has gone into the RTP and am excited to see what the future holds. The City's approved Coastal Rail Trail Project route was selected through a multi-year public process and has been fully designed. The project is on the City's CIP list to begin construction in 2022. This project redesigned the originally proposed route through Rose Canyon and Roselle Canyon noting conflicts within the Multi-Habitat Planning Area (MHPA) to acquire Right-of-way. The original route was also rejected after extensive engineering analysis because of grading impacts, safety along the remote sections, potential conflicts with MCAS Miramar, and other reasons. However, the Draft 2021 RTP includes costs for segments of the Trail that continue to reflect the original route and not the current route.</p> <p>As a result, I request that the RTP's Appendix A: Transportation Projects, Programs and Phasing reflect the City's segment of the Coastal Rail Trail project as updated, including the following changes:</p> <ul style="list-style-type: none"> <li>• Page A-6, Project ID AT032, Active Transportation Category: Remove reference to Roselle Canyon</li> </ul>	<p>Thank you for the update on the City of San Diego's Coastal Rail Trail project S00951. Portions of that 1.63 mile project are identified as the Gilman Connector in our project list and will be updated to reflect the status in your CIP list. It is going to be a vital connector to SANDAG's recently upgraded Rose Canyon Bike Path and our newly constructed Rose Creek Bikeways to the south. Extending north, however, there remains a desperate need for safe, direct, all ages and abilities active transportation alternatives extending into currently underserved residential (University) and employment centers (UTC, Sorrento Valley) to improve alternatives in this major transportation corridor. In order for SANDAG to stimulate the shift from personal motor vehicle use to people choosing to bike, a network of well-designed routes is essential. The City of San Diego's project on Gilman Drive is greater than 2 miles away from, and represents just 25% of, the entire length of the projects you are requesting be removed.</p> <p>The Coastal Rail Trail segments you've identified for removal from the transportation network represent 6.2 miles of regional bikeways connecting to the existing Sorrento Valley Coaster Station, as well as future Transit Leap services. As you may know, these</p>

**Draft 2021 Regional Plan Responses to Comments – Email Sourced**

ID	Commentor Name	Agency	Comment	Response
			<p>to state “Carmel Valley to Sorrento”</p> <ul style="list-style-type: none"> <li>• Page A-6, Project ID AT036, Active Transportation Category: Remove this segment through Roselle Canyon</li> <li>• Page A-6, Project ID AT037, Active Transportation Category: Remove this segment through UTC to Rose Canyon</li> <li>• Page A-31, Project ID AT023, Active Transportation Category: Remove this segment through Rose Canyon</li> </ul> <p>Making these changes should reflect the current Coastal Rail Trail project as connecting to the two Connecting Corridors of I-5 North County Coastal (I-5-NCC) and Coast, Canyons and Trails (CCT). Updating the Appendix as requested will eliminate \$54 million in project costs. I ask for your full and fair consideration to continue these efforts by updating the 2021 Draft RTP as requested.</p>	<p>projects and this alignment were first identified in the 2000 Coastal Rail Trail Project Study Report:  <a href="https://www.keepsandiegomoving.com/Libraries/Transnet-doc/Coastal_Rail_Trail_Project_Study_Report_reduced.sflb.ashx">https://www.keepsandiegomoving.com/Libraries/Transnet-doc/Coastal_Rail_Trail_Project_Study_Report_reduced.sflb.ashx</a>.</p> <p>These projects were approved by the SANDAG Board of Directors In 2010 with the development of a comprehensive regional bike network - Riding to 2050: The San Diego Regional Bike Plan:  <a href="https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail</a>.                      And again, these Coastal Rail Trail segments were identified as a priority project in 2013 via the Bike Early Action Program (EAP):  <a href="https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail</a>.</p> <p>We will not be removing these projects from the Regional Plan. We respect and appreciate your notes of caution and conflict regarding the challenges of constructing Rail Trail projects like these particularly with the myriad stakeholders here. Our recently completed Inland Rail Trail, Coastal Rail Trail, and Bayshore Bikeway projects have proven to be extraordinarily complex for these reasons, and often encountered great opposition from concerned residents. All of the effort is worth it to serve the most vulnerable users of our transportation system with the healthiest modal options available however, and these bikeways are now universally appreciated elements of our transportation network and communities. We plan to deliver the 3 projects you've identified here with a commitment to achieve this same level of success and look forward to partnering with you to ensure that happens.</p>
E98	John Fischer III	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>The presentation was above average. There was somebody in the audience who wanted to only focus on Highway 67. I believe it would have been hood to have follow-up information, through an email with an attachment. If there was to much information to make a presentation within 1 hour, maybe give links before the meeting in email.</p> <p>Toastmasters teaches how to make presentations, which would improve the skills of the presenter.</p> <p>With rolling black-outs, there was no mention of how the Governor Newsom plans on being 100% electric cars by 2030.</p>	<p>The transition to cleaner vehicles will only exceed through efforts by government at all levels and industry together. California has enacted several clean vehicle laws for passenger vehicles, buses and trucks that signal the auto industry to produce cleaner vehicles. The auto industry has made major commitments and investments to shift to all electric in the coming decade(s). For the San Diego region, the 2021 Regional Plan supports incentives and other investments in the electrification of cars, trucks and buses and their supporting infrastructure (e.g., EV charging stations and hydrogen fueling stations) as one of the ways SANDAG helps reduce regional greenhouse gas (GHG) emissions and improve local air quality. Appendices A (Table A.17) and B show SANDAG's proposed EV commitments.</p>
E99	John Peters	N/A	<p>I strongly oppose the new proposed “per mile tax”. I do not want any more tax dollars to go toward roads and highways. What happened to all the tax dollars from the “gas tax”? The public deserves to see a full account of those “gas tax” dollars and where they went. Proposing a new tax is out of the question.</p>	<p>Nationwide states and regions are confronting the shortfalls of gas tax revenues to fund maintenance, operations, and construction of their transportation systems. The federal gas tax was the largest source of transportation funding for many decades. However, the federal gas tax per gallon has not changed since 1993, that is when the minimum wage in California was \$4.25. The federal gas tax does not grow with inflation and the purchasing power of that source has diminished over time. States and regions have implemented their own sales and gas tax measures to try and meet the needs of their transportation systems. However, the best tax measures tied to fossil fuel consumption will continue to erode in time as vehicle technologies change.</p>
E100	John Shaffer	SanDiego350	<p>I would like to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. Please consider soonest as Spring Valley and other unincorporated areas are in desperate need of public transportation. 24-hour service and increased transit frequency: Make the transit system fast, frequent, reliable, and accessible by increasing passenger capacity, hours of service, and frequency on popular lines. This means 24-hour service and 10-minute frequency on many popular bus and trolley routes to connect</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>

			<p>people to jobs, school, and more. Improve transit amenities: Make immediate improvements to amenities at transit stops, including benches, shade from the elements, and bathrooms that are accessible according to ADA regulations. Improving transit amenities increases ridership and is crucial to providing our disabled community access to public transportation in an equitable way. As a member of a Planning Group, we hear from the public consistently the need for more public transit.</p>	<p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p>
E101	John Stump		<p>Thank you for providing the public and businesses with the opportunity to comment on the draft Regional Plan. I have been a resident, business owner/manager, and residential/commercial property owner in Southeast and Mid-City San Diego for more than 50 years. I have served as an elected redevelopment official, Bond oversight committee member, and Chaired many of the infrastructure oversight committees for major projects in these areas. I have served as Counsel to most of these areas Business Improvement Districts and many local businesses.</p> <p>My comments are prioritized by those that would address 1. Immediate Dangers to Human Life and Health and Real Property losses; 2. Short Term Environmental and &amp; Climate Change infrastructure; and 3. Immediate improvement to Congestion Relief and Economic Development in council Districts 4 and 9. My families projects are as follows:</p> <p>1. IMMEDIATE DANGERS TO HUMAN LIFE AND HEALTH AND REAL PROPERTY LOSSES: The Auburn Creek tributary has been channelized, permeable flood plains replaced by impermeable concrete; and Auburn Creek road under crossings are undersized, creating storm water backups and flooding. The school route sidewalks, at Wightman Park , regularly overtop creating drowning dangers to children and floods the adjacent apartment housing causing mold infestations. The City of San Diego needs and has long had on its CIP projects list a redo of the undercrossing at University Avenue and needs to address the undersize nature of the four (4) downstream undercrossing that back up and cause flooding of streets and real property. Further, all adjacent street storm water drains directly in to Auburn Creek and thus, through the impaired Chollas Creek into San Diego Bay. Infiltration basins need to be constructed to improve and control storm water quality. CALTRANS dumps i-805 road wash directly into the creek at Home Avenue.</p> <p>2. SHORT TERM ENVIRONMENTAL AND &amp; CLIMATE CHANGE INFRASTRUCTURE: Safe Pedestrian sidewalks, like those being installed along Market Street-between Euclid and 47th Street are requested for the North side of Home Avenue -between Fairmount and Euclid Avenue. Designation of much of the Mid-City's and Southeast's business districts and adjacent residential areas as eligible for low powered alternate vehicles, like Golf Carts, as provided by the California Vehicle Code, would slow traffic and provide a safer cleaner alternative to gasoline vehicles.</p> <p>3. IMMEDIATE IMPROVEMENT TO CONGESTION RELIEF AND ECONOMIC DEVELOPMENT IN COUNCIL D 4 AND D9: Please fund the long-awaited reconnection of Home Avenue and Market Street. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles, and Vehicles. The Home / Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94 - Martin Luther King Freeway.</p>	<p>SANDAG consider stormwater, or urban runoff during the project development process and partners with regional transportation infrastructure owners and operators to manage stormwater from roads and highways in the region. For more information on stormwater, please see Appendix R of the 2021 Regional Plan. In addition, the crossings referenced in the comment fall within the City of San Diego's jurisdiction.</p> <p>While Home Avenue is not on the Adopted Regional Bike Network, the 2021 Regional Plan includes the nearby and parallel Chollas Creek Bikeways: North Fork - Bayshore Bikeway to University Bikeway and South Fork - Petway Park to Market Creek Plaza which will improve the connections described in this comment. The project alignment and details can specifically be found in the updated data viewer and Appendix A. The City of San Diego and Metropolitan Transit System are the implementing agencies for these improvements. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is in development and provides another opportunity to provide input on transportation solutions for this area. Establishing special districts is under the purview of the City of San Diego.</p> <p>Your comment was forwarded to the City of San Diego.</p>
E102	John Wotzka	N/A	<p>Don't forget the Offshore Wind projects planned by the Biden Adm. The West Coast needs to find ports that will be able to build and launch components for the Offshore wind project coming in the future.</p>	<p>The Port of San Diego would be the local lead agency for the Offshore Wind project. SANDAG will work with the Port of San Diego to discuss the Offshore Wind project and other future transportation needs.</p> <p>Your comment was forwarded to the Port of San Diego.</p>
E103	Johnny Tran	N/A	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>

			hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.	Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E104	Jon Salunga		I am a local educator in Southeast San Diego. My students deserve access to high-quality transportation and economic mobility. I urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under receive priority when Transit Fare Subsidies are allocated. Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region's equitable economic recovery. No-cost transit passes for all youth ages 24 and under ensures generations of lifelong transit riders are part of our long-term strategy to build a greener and equitable San Diego. Please contribute to the efforts to make this return to the new school year DIFFERENT, in a good way, so our students know we are supporting them inside and outside the classroom to be their best.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
E105	Jordan Krueger		As a North County resident, I support the 2021 Regional Transportation Plan. It is important to me that we reduce greenhouse emissions for a cleaner environment and provide clean rapid transit for people of all ages connecting ALL of San Diego. I support timely rapid transportation for all San Diego County community members who support San Diego's business community.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E106	Jose Marie Zambrano	N/A	Very helpful.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E107	Josephine Thompson		There must be free transit for YOUTH, especially!  So many places have free transit for everyone and hopefully someday that is how it will be soon. At least give the YOUTH the break now for FREE TRANSIT.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
E108	Joshua Piedra	SanDiego350	While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.  Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E109	Josie Caballero	SanDiego350	While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. E113	Justin Yurasek		<p>Hello-</p> <p>I have a few ideas to help with commutes to and from north county and the main employment centers down south. I commuted to and from Vista to UTC for several years and had the following ideas. I no longer commute these days as I've changed jobs, but I cringe for those who still do. Right now, there are many bottlenecks that prevent traffic from flowing smoothly.</p> <ol style="list-style-type: none"> <li>1) Connect Cannon road from Vista to Carlsbad.</li> <li>2) Connect Citracado parkway from the 78 to the 15 and make sure it has 2-3 lanes in both directions.</li> <li>3) Provide express lanes from UTC La Jolla Village Drive down Miramar road all the way to I-15. Basically, allow people to connect from UTC to I-15 without getting stuck in all the lights on Miramar.</li> <li>4) Provide a main parkway type of surface street from the 56 to the 78. Right now many of the surface streets are two lane roads with lots of stop signs. A 2-3 lane road connecting all the way would alleviate traffic on the freeways.</li> </ol> <p>Some of the above are big efforts, however, I don't see any other way around it.</p>	<p>The Regional Plan includes improvements for arterial roadways, such as these, so that they can benefit from management approaches and technology enhancements to increase efficiency and reduce delays.</p> <p>Your comment was forwarded to agencies that oversee these facilities.</p>

			Let me know!	
E114	Justino and Angela Martinez		<p>I write to you in opposition to the plan to Charge Per Mile or VMT of the 2021 Regional Plan! I've been watching your executive director since we briefly lived in Los Angeles. He's untrustworthy and it baffled us why San Diego Board of Supervisors would hire Hasan with a pay increase. He's been trying to implement LA/NY style transportation policies in our historically more fiscally conservative county. Now your co-chair Alejandra Sotelo-Solis has been quoted saying "We can't we be more like New York" on KUSI &amp; other sources. Enough!</p> <p>We expect that your "outreach events" will be mostly attended by lobbyists and will be a really uncomfortable &amp; biased environment for any opposition. Lobbyists are organized and paid very well. These operatives are connected to many members within your organization.</p> <p>It's time for a 'No Confidence Vote' for Hasan! (to start)</p> <p>We Love San Diego,</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.</p>
E115	Karen Anderson	SD350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>Either we go BIG, or we fall far short of meeting future needs. Now is the time to do everything possible to mitigate the climate crisis. Please make the largest investments possible.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E116	Karina Gonzalez	Hammond Climate Solutions	<p>Hammond Climate Solutions is a local, mission-based social enterprise working to stop the climate crisis and ensure a just, livable future. We are pleased to see SANDAG's new direction and want to ensure that the 2021 Regional Transportation Plan is setting bold climate targets while remaining strong on family-sustaining jobs and environmental justice. This letter highlights recommendations that we feel are necessary in order to address the climate crisis, address inequities in our transportation infrastructure and ensure that equity is centered in every decision moving forward. Our first recommendation is to include no-cost Youth Opportunity Passes. Local community-based organizations in communities of concern, which understand how no-cost passes for youth would positively impact their community, have been advocating for this for over a decade. Studies show that youth transit riders have a higher probability of becoming adult transit riders. Our youth should be a priority group when allocating transit subsidies. We also recommend tailored subsidies for people in communities of concern. Transit subsidies colleaguine to community members who require them, whether that be through using targeted zip codes or census tracts, residents who are on SDG&amp;E's CARE or Ferrates or medical baseline customers. It is important to acknowledge that these communities have experienced historic under investment and moving forward should be prioritized first when determining the distribution of subsidies. While we are pleased to see SANDAG's data evaluating access to basic needs and opportunities via transit, we believe the timeline for improving access to employment centers, higher education and medical centers needs to be significantly shortened. Our communities cannot afford to wait another 30 years for only a marginal increase in accessibility. We urge SANDAG direct immediate funding for infrastructure improvement to communities of concern and low income communities of color in order to drastically improve transit accessibility and ensure our transit systems are working for everyone. As</p>	<p>SANDAG will be applying a social equity planning framework throughout the implementation of the Regional Plan. Through this framework, we recognize the urgent need for reduction of GHG emissions, especially in our most marginalized communities, as a key aspect in an equitable and sustainable future for the region. I would like to direct you to Attachment 3 of Appendix H: Social Equity: Engagement and Analysis, where you will find a list of transportation projects aimed to reduce pollution exposure in our region's disadvantaged communities in accordance to AB805 and CalEnviroScreen 3.0. More detail on phasing and funding allocations to these projects can be found in Appendix B: Implementation Actions.</p> <p>Another one of the near-term Implementation Actions listed in Appendix B will be a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, students, and youth. SANDAG also is currently working with the Social Equity Working Group to develop near-term solutions to address transit service improvements, amenities, and subsidized transit fares.</p> <p>In Appendix U: Cost Estimation Methodology, Table U.2 captures the transit fare subsidies to riders throughout FY2026-FY2050. For more information on the Value Pricing and User Fee Implementation and the Regional Fare Impact Study, please see Appendices B and U.</p>

			the worst effects of climate change begin to emerge throughout the county and evacuation events as a result of wildfires and flooding are becoming more frequent, it is imperative that our transit system is emergency-ready. Our environmental justice communities are on the frontlines of these climate change emergencies and deserve adequate transportation to safe hubs in the case of an emergency or evacuation event. Lastly, we urge SANDAG to exceed state mandated targets for emission reduction as climate science says is necessary to prevent the worst effects of climate change. Our region should be a leader and exceeding state mandated targets by one percent is simply not enough in a climate emergency. We appreciate the opportunity to provide feedback on such an important plan.	MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG's specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.  Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E117	Kasey Clark	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for GHG emissions reduction, biking infrastructure projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E118	Katharine Harrison	SanDiego350	I truly appreciate the shift SANDAG has taken toward public transit goals, but I think the GHG reduction goals are too low and the transit project timelines too slow for the speed and gravity of the current climate emergency. There is still too much emphasis on roads for private vehicles. Climate change is manifesting itself quickly all around us so our response needs to be big, bold, and fast. A way to cut car emissions, which are about half of the county's total emissions, is with attractive, enhanced public transport that provides easy, efficient mobility for all of us. I taught many years at a small public high school on the campus of City College where students come from surrounding low-income neighborhoods. The school district provides free or discounted youth passes for MTS, depending on their family circumstances, and this has made a huge difference for our students, allowing them to flourish and take college classes early. I've seen the problems that occur when they can't get those passes in a timely manner or the trolleys don't run efficiently enough to help them juggle their time commitments to school, work, and family. The Regional Plan should include free transit passes for all school-age youth and young adults much sooner than 2027, to help them in every way possible join our vibrant economy and citizenry. Furthermore, no-cost passes will encourage significant participation in public transportation and shift expectations for how San Diegans use transit, allowing us to meet more accelerated targets for GHG reductions. We can do better than 40% by 2030 if we act quickly on public transit goals.	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E119	Kathleen Roth	N/A	<p>Reference: Project 644885 Coastal Rail Trail SDP</p> <p>As an avid road bike cyclist (non-E-bike) who rides over 5,000 miles per year including a weekly ride on Gilman Drive between the new Rose Canyon Bike Path (thank you!) and UCSD, I would like to offer the following comments on the Coastal Rail Trail project:</p> <ol style="list-style-type: none"> <li>1. The sidewalk continuation appears to be a good feature.</li> <li>2. Uphill/northbound cycle track between I-5 off ramp and Via Alicante is probably okay.</li> <li>3. There are too many crossing conflicts north of Via Alicante and entire length downhill/southbound to trap cyclists in bikeway with no escape route, especially considering typical relatively high speed of cyclists (20-30+ mph) on downhill portion. E-bike speeds uphill are a concern, too.</li> <li>4. If cycle track project goes ahead, please include sharrow and "Bikes May Use Full Lane" signs so motorists know cyclists riding in the travel lane are not doing anything illegal.</li> <li>5. The barriers themselves are crash hazards to cyclists and the restart of barriers after each driveway is especially dangerous.</li> </ol> <p>Thank you for allowing me to comment on the project.</p>	<p>While the Gilman Drive alignment is on the Adopted Regional Bike Network included in this Regional Transportation Plan, the specific project you're referring to is on the City's CIP list to begin construction in 2022. Your comments might best be noted and addressed by the implementing agency - the City of San Diego, please see webpage here for contact information: <a href="https://cipapp.sandiego.gov/CIPDetail.aspx?ID=S00951">https://cipapp.sandiego.gov/CIPDetail.aspx?ID=S00951</a>.</p> <p>Your comment was forwarded to the City of San Diego.</p>

## Draft 2021 Regional Plan Responses to Comments – Email Sourced

ID	Commentor Name	Agency	Comment	Response
E120	Kathy Rudie	N/A	<p>SANDAG's road tax must be stopped. It would be double taxation and an invasion of our privacy. We (Californians) already pay high gas and DMV taxes to maintain our roads. How about taxing just the electric car owners? They do not pay the gas taxes at the pump and are using our roads. We do not need to be tracked by the government, we are already spied on enough.</p> <p>Are our all our current taxes (DMV and gas) actually going to maintain our roads? If they are not, maybe those loopholes need to be closed and get our money going to where it s intended. ( Same for the lottery money- but only going directly to our schools)</p>	<p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, and fair to all.</p> <p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>We understand there are concerns around the privacy and implementation of a road usage charge. There are several ways to implement a road usage charge without the use of tracking devices in personal vehicles. Significant additional work, including public involvement, pilot testing, legislation and much more will be necessary to inform implementation of elements of this plan, including the road usage charge. At a minimum this plan is updated every four years with the latest in planning ideas and concepts. Further research will, and is currently, being conducted at the regional, state, and federal level on how to effectively implement these new funding options while safeguarding the public's privacy.</p>
E121	Kathy S	N/A	Need bathrooms.	The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.
E122	Katie Meyer	SanDiego350	<p>While I want to thank the staff at SANDAG for their progress in addressing climate and equity in this Regional Transportation Plan draft and for drafting the boldest plan that SANDAG has ever proposed. However, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>As a lifelong transit rider, 24-hour service and increased transit frequency are especially important to me. When I was in school, I would often spend 4-5 hours a day on busses and trollies to get to Grossmont and then work in Pacific Beach. When I had late classes or late meetings, not having frequent busses and trollies would mean I would add 30 minutes to an hour to my daily trip, often waiting by myself in the dark for the next bus or trolley. Many people in San Diego have similar experiences with transit making it especially unpractical for those with night classes and those that work nights.</p> <p>We must make the transit system fast, frequent, reliable, and accessible by increasing passenger capacity, hours of service, and frequency on popular lines. This means 24-hour service and 10-</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p>

E123	Katie Trist	A Better Life Together/El Cajon Collaborative	<p>minute frequency on many popular bus and trolley routes to connect people to jobs, school, and more.</p> <p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>You mentioned people under 24 getting free or cheaper rides I think is a wasted resource. Colleges often have their own transportation and many people under 24 still live with parents instead, I think cheaper/free rides for people who use CalFresh or MediCal would be a much better way to use resources to provide free rides.</p> <p>It was a nice presentation.</p> <p>Also VA has lanes that can go either way and often it did not help with traffic. Has there been review of other cities that have HOV lanes in both directions?</p>	<p>Una de las Acciones de Implementación enumeradas en el Anexo B es un Estudio del Impacto Regional de las Tarifas. Este estudio asegurará que las partes interesadas públicas tengan la oportunidad de expresar su opinión sobre las alternativas. Se espera que el estudio finalice en el año fiscal (FY) 2024 e incluirá una evaluación de los subsidios para las tarifas de las personas de bajos ingresos, los adultos mayores, los estudiantes y los jóvenes. Mientras tanto, el personal de SANDAG, MTS y NCTD está trabajando con las partes interesadas en un programa piloto de un año que puede ofrecer tarifas gratis a los jóvenes menores de 19 años.</p> <p>***</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>The proposed managed lanes system includes reversible lane concepts to accommodate peak directional traffic on specific corridors. This concept is similar to the Interstate 15 Express Lanes which includes other policy (example: HOV 2+) and pricing requirements. The lanes are dynamically managed through the use of technology to provide faster travel times for transit and other priority access vehicles. More information on Complete Corridors can be found on <a href="http://SDForward.com">SDForward.com</a>.</p>
E124	Kelli Dumas	N/A	<p>I am against the proposed “miles driven tax”! This tax will negatively affect the hard working families of San Diego County.</p> <p>Getting back to work post pandemic is already challenging enough for most families. These proposed taxes are not fair nor are they necessary.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues.</p>
E125	Kelly A Lyndo	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn’t move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>In particular, it is critical accelerate GHG reduction goals: Meet the required greenhouse gas emission targets, and ensure measures get us to those goals using federal and state funds available to create high-quality union jobs. Climate change is accelerating, and we are currently seeing the results, which are especially devastating to environmental justice communities. We can’t wait any longer to take the actions needed, so our families and our children have a livable future. The emissions reduction goal in the plan of 40% by 2030 is inadequate in addressing the climate crisis.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
E126	Kelly Nytes		<p>I urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under and seniors 55 and older receive priority when Transit Fare Subsidies are allocated.</p> <p>Youth are often dependent on public transit to access school, enrichment opportunities such as museums, internships, and jobs. Economically challenged families are more likely to be able to take their children to medical or other appointments and to access opportunities in San Diego.</p> <p>In addition, early positive experiences with public transit increases the likelihood that individuals will choose this environmentally friendly option as adults, reducing traffic congestion and emissions.</p> <p>Seniors, too, may become dependent on public transit if they lose the ability to drive safely or face</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>

			<p>financial challenges on fixed incomes. Having their fare covered would increase the freedom of seniors to be able to access shopping, medical offices, and cultural opportunities.</p> <p>Please amend Appendix A for youth and seniors, supporting their access to transportation while encouraging environmentally friendly options.</p>	
E127	Kelsey Pickert	Surf Rider Foundation	<p>Hi, I am with the San Diego Surfrider Foundation. I am writing because I wanted to thank the staff at SANDAG for their progress around transportation in this RTP. However, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>Additionally, create and fund an anti-displacement strategy to protect vulnerable communities living near transit corridors by preserving existing affordable housing, encouraging community ownership, and protecting tenant rights as well as developing new affordable housing.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p>
E128	Kieanna Huerta	N/A	More transportation.	Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a> . The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.
E129	Kim Heinle (on behalf of various commentors)	Bayside Community Center	<p><b>**Comments from Bayside Community Center Senior Luncheon (July 9, 2021) with 3 attendees/commentors. Comments submitted to SANDAG via Bayside Community Center**</b></p> <p>[Comments pertaining to South Bay to Sorrento Comprehensive Multimodal Corridor Plan] Free Passes / Low cost day trips are needed. There should be lower costs for kids or free for children under 5 years old. The bus line was cut in out neighborhood (Linda Vista) and we would like it back! Low emission busses are a great idea. They're better for the environment and better for people with respiratory problems. This project is good for people to reach their destinations. There should be more small busses to transport people to main streets for transferring. Where will the stops be along the project corridor?</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>Specific transit stops along corridors will be defined in project level planning and analysis.</p> <p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a>.</p>
E130	Kim Heinle (on behalf of various commentors)	Bayside Community Center	<p><b>**Comments from Bayside Community Center Senior Lunch Program (July 27, 2021) with 21 attendees/commentors. Comments submitted to SANDAG via Bayside Community Center**</b></p> <p>What they like about transportation: 5-minute regular bus frequency; connection and transfer to Downtown SD from Linda Vista; making Linda Vista walkable; direct bus to the airport</p> <p>What they dislike about transit/transportation: traffic congestion on the freeway; potholes; disobedient drivers</p> <p>What they suggest as improvements needed in the Draft Plan: -Rides for seniors who can't drive - Build homeless shelters / Housing near transit stations - Add more bus lines. Give more attention to busses and less to trolleys - Ensure there are earlier bus times and more options for weekend riders - Add more share at bus stops. Its too hot! -Make an express bus route from Linda Vista directly to Downtown San Diego.</p>	<p>SANDAG acknowledges that action is needed now to provide fast, frequent, reliable, and accessible transit, especially seniors and aging populations. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities such as Linda Vista. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights. Additional information on increased frequencies and spans of service for the transit system has been added to Appendix A.</p> <p>SANDAG will also be conducting pilot programs for the implementation of Flexible Fleets and other micro-mobility options to help connect people connect to the transit network. Information regarding Flexible Fleets can be found in Appendix A and N. Addition materials can be found at: <a href="https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdfrpvisionfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f865_2">https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdfrpvisionfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f865_2</a></p> <p>SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. 			<p>-Add a Linda Vista “mini-bus” community transport                      - Limit housing right on trolley lines (Its too loud).</p>	<p>include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p>
E131	Kim Heinle (on behalf of various commentors)	Bayside Community Center	<p><b>**Comments from Linda Vista Collaborative meeting (July 21, 2021) with 13 attendees/commentors. Comments submitted to SANDAG via Bayside Community Center**</b></p> <p>Regarding hours of operations, public transit must be operational throughout the night to accommodate workers, students at collage, SD’s growing workforce, etc. The duration of the services must be extended.</p> <p>I’m excited that these projects are happening. They’ll help our families connect to greater resources, including recreational activities.</p> <p>-This looks really cool. Regarding hubs, how many will there be? Regarding cost, will there be an added gas tax or how will this funded? Make sure this is properly designed.</p> <p>- Regarding incentives, encourage people to ride public transportation, like in the County of SD does w/ 100% reimbursement</p> <p>-Regarding hubs, let’s use the open space as a place to bring health resources to the people, things like farmers markets, farm stands w/ EBT access, COVID vaccines, health screenings, and public health measures. Collaborate as agencies. Bring the resources TO the community at these mobility hubs. Meet them where they’re at.</p> <p>- Connect SDMTS passes with public benefits. So if they qualify at a certain percentage of FPL, subsidize the ridership pass.</p> <p>- I’m excited that these projects are happening. They’ll help our families connect to greater resources, including recreational activities.</p> <p>- Make sure this is accessible for youth (Youth Opportunity Pass) so kids can move freely and parents don’t have to worry. Connect youth with places of recreation.</p> <p>- Invest more in bus lines. Slow down traffic and give it to the busses. Dedicated bus lanes are worthwhile investments. Invest in the speed of the bus to make it more attractive while disincentivizing private vehicle travel.</p> <p>- Concern re: hours of operation: public transit must be operational throughout the night to accommodate workers, students at college, SD’s growing workforce, etc. The duration of the services must be extended.</p> <p>- Re: purple line: Why are we designing 10-30-mile distance commutes instead of housing people where they work, go to school? We need to add density and to add it where people work.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, has been added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>Thank you for the comment. Each regional mobility hub coverage area was identified based on a variety of factors including existing and projected population and job growth along with information on where and how people travel. Funding mobility hubs is a truly collaborative effort between SANDAG, local jurisdictions, transit agencies, private developers and employers, and more. Given the large number of mobility hub stakeholders, innovative public-private partnerships can be forged to fund, design, and implement various aspects of mobility hubs including stations, complete corridors improvements, and other mobility hub amenities.</p> <p>The Mid-City Trolley Line (Purple Line) is included as the first major new rail project in the Plan and will serve the north-south travel needs in Sorrento Mesa, National City, Kearny Mesa, and University Heights. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is completing a more detailed ridership analysis of this route. The analysis is studying an alignment that would include stations in City Heights and at San Diego State University (west campus).</p> <p>Additionally, Rapid services are planned that can use dedicated roadway space to increase speeds and avoid congestion. The vast majority of these Rapids also are planned in near-term phases of the Plan.</p>
E132	Kim Heinle (on behalf of various commentors)	Bayside Community Center	<p><b>**Comments from Bayside Community Center Senior Luncheon (July 9, 2021) with 4 attendees/commentors. Comments submitted to SANDAG via Bayside Community Center**</b></p> <p>[Comments pertaining to South Bay to Sorrento Comprehensive Multimodal Corridor Plan]                      All four answered in the affirmative (“good” or “agree”) to the four questions below:                      1) Do you agree with the plan of zero emission vehicles? Why?                      2) Do you feel safe when walking on the sidewalk or crossing the street? If not how can we improve it for you?                      3) Do you agree with creating more bus routes? Do you agree with creating rapid bus lanes?                      4) What do you think about the street quality in the city that you are living in?                      One of the seniors elaborated on Q#1, saying that zero emission vehicles are “good for health and the environment.” He and one other ...                      ... senior also responded “Safe” to Q#2.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
E133	Kimberlyn Caywood	SanDiego350	<p>I’d like to take the time to thank SANDAG for the progressive new actions it has taken to ensure that more San Diegans have access to public transportation. 			<p>every hour. I know that this is better access to transit than most Oceansiders and San Diegans in general can count on, but that didn't mean much for me this past year as an essential worker on night shift as I was forced by limited transit to spend nearly 1/3rd of my monthly income on rideshare services. And I'm not the only coworker and neighbor facing this dilemma. Transit does not run 24 hours a day or provide frequency of service that aligns with working two jobs, attending school, or childcare.</p> <p>So please reevaluate the RTP to move faster in meeting targets for emissions reduction, increase funding to transit projects, and expand the hours of service and frequency of transit. We can not miss this opportunity for change and aggressively building a better more livable county. Current and future San Diegans like me are counting on it.</p>	
E137	Lanny M	N/A	<p>What an absurd money grab. We already pay plenty of taxes to pay for under used public transit. Trolleys and busses that are nearly empty running to destinations that avoid housing areas. It's just unconscionable that you plan to rob San Diegans again.</p>	<p>Thank you for your comment.</p>
E138	Laura Cunningham	SanDiego350	<p>Immediate changes to halt the climate crisis should be the priority. An emphasis on good, frequent, cheap public transportation is imperative. Get away from individual cars!                      Making public transportation free for low income, disabled, seniors and students.                      More frequent public transportation between North County and San Diego.                      More options from train stations to major business and office areas.                      TRULY affordable housing near transportation centers, and centers near high density housing areas.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. 			<p>positive changes in more protected infrastructure for bikes, but it hasn't been enough and it has been too slow. I still hear in the news, from friends &amp; family about deaths of people on bikes and pedestrians. I own a small business in Liberty Station which I commute to daily from Hillcrest by bike. My bike keeps me healthy and keeps my transportation costs low. I tried to take public transportation for my commute, but the public transportation to and from Liberty Station is sadly lacking. I support Vision Zero, and hope that more people will feel comfortable and safe choosing to ride a bike for transportation. Safety, physical health, and mental health must be the priority over getting somewhere faster.</p> <p>Everyday I continue to choose to ride my bike because of the benefits to myself and my society in the beautiful city of San Diego.</p>	<p>take a fresh look in the new one. With the ever increasing popularity of e-bikes, we do feel it is important to build bike network in both flat and steep areas so provide as many network connections as possible. Additionally the prioritization will include more recently completed and near-term transit projects to facilitate connections like those you mention.</p>
E142	Leah Schaperow	SD350	<p>I ride my bike to commute to Liberty Station. I ride my bike to get groceries, wherever I go I ride my bike. I do not own a car and public transportation does not always go where I need to go when I need to be there. Please move faster to keep me safe on the road.</p> <p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>SANDAG follows national and international best practices in bikeway design to create safe facilities for users of all ages and abilities. Every project goes through a detailed and context sensitive design process which results in decisions regarding the best facility, which may include protected bikeways, buffered bikeways, shared use paths, or shared streets with significant traffic calming elements. The Regional Plan also includes funding for upgrading existing bikeways that may not meet current best practices in maintenance or bikeway design.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
E143	Leeya Appleby	N/A	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT.</p> <p>The 5 Big Moves will enhance connectivity and result in people having more travel options and operating solutions, reducing per capita VMT. Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan. Appendix B includes the near-term actions that SANDAG will work towards achieving these goals. Many of which are anticipated to begin work immediately after the Plan adoption.</p>
E144	Leslie Bridges		<p>As a North County resident, I support the 2021 Regional Transportation Plan. 			<p>the climate crisis and give those reliant on transit the relief they need. We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>I took the bus everywhere I needed to go. I spent most of my free time waiting for the bus. And if it didn't go where I needed to go, I wouldn't go. You try taking three buses to a colonoscopy and home again afterwards. There wasn't even a bench to sit on. I had to sit on the curb in Kearney Mesa.</p>	<p>levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E146	Linnea Dayton	N/A	<p>As a North County resident, I support the 2021 Regional Transportation Plan. It is important to me that we reduce greenhouse gas emissions for a cleaner environment and provide clean rapid transit for people of all ages connecting ALL of the San Diego region. I support timely rapid transportation for all San Diego County community members, so they can conveniently access jobs, businesses and community services.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
E147	Lori Mendez	San Diego 350, Sierra Club, The Climate Reality Project	<p>I am with San Diego 350, Sierra Club, and The Climate Reality Project. I drive a Nissan Leaf and power it with solar panels (during the sunlight hours). I am also an avid walker, hiker, cyclist, and outdoor enthusiast.</p> <p>I am writing because I want to thank the staff at SANDAG for their progress around transportation in this RTP.</p> <p>As you know, we are in a race against time. Accordingly, this plan must move more quickly and efficiently to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>Accelerate GHG reduction goals: Meet the required greenhouse gas emission targets, and ensure measures get us to those goals using federal and state funds available to create high-quality union jobs. Climate change is accelerating, and we are currently seeing the results, which are especially devastating to environmental justice communities. We can't wait any longer to take the actions needed, so our families and our children have a livable future. The emissions reduction goal in the plan of 40% by 2030 is inadequate in addressing the climate crisis.</p> <p>1. Accelerate transit improvements: Accelerate the timeline for all transit (trollies, buses, rail) and biking infrastructure improvements and prioritize the Environmental Justice communities that need transit solutions the most. Environmental Justice communities, who disproportionately suffer from the effects of climate change, cannot afford to wait; they need immediate improvements while the long-term infrastructure projects are being planned. This means no new roads and specifically accelerating the purple line and collaborating with MTS to improve the blue line that serves these communities. This also means transitioning transit to zero-emission vehicles.</p> <p>2. 24-hour service and increased transit frequency: Make the transit system fast, frequent, reliable, safe, and accessible by increasing passenger capacity, hours of service, and frequency on popular lines. This means 24-hour service and 10-minute frequency on many popular bus and trolley routes to connect people to jobs, school, and more.</p> <p>3.Improve transit amenities: Make immediate improvements to amenities at transit stops, including benches, shade from the elements, and bathrooms that are accessible according to ADA regulations. Improving transit amenities and ensuring safety of riders increases ridership and is crucial to providing our disabled community access to public transportation in an equitable way.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. MTS is working to provide shelters throughout the region. Bus shelters are provided wherever there is sufficient right of way to locate them. Any new infrastructure build would include shelters. Complete Streets designs are an important component of SANDAG's planning today and will be included on projects in the future. As part of larger infrastructure projects like Next Generation Rapid, Trolley and Commuter Rail, all stations will have shelters. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>The transit network that has been developed for the Regional Plan includes faster access to the beach. There are Rapid and Commuter Rail routes that will operate between Mid-City and the proposed Central Mobility Hub. From that location you can seamlessly transfer to routes that will take you to Ocean Beach, Pacific Beach and La Jolla.</p>

			<p>4. No-cost passes: Provide no-cost transit passes to ALL beginning in 2023, not 2027. No-cost transit passes encourage significant participation in public transportation and help shift expectations for how San Diegans use transit. Additionally there will be less demand for roads and parking, more mobility for people, giving them more range to find employment, leading to more taxable income, Social justice: roads favor only those who can afford cars, but transit is equitable, increased ridership, leading to more and better transit, increased and cheaper commerce since freight delivery has less traffic, GHG reduction, fewer stressed drivers on the road, less road rage, fewer cars mean more safety for all other road users, less pollution means better health, less tax money spent on cars, cars, cars; supporting single-occupancy vehicles is shameful for resource efficiency.</p> <p>5. Equitable service: It shouldn't take hours to get to the beach from City Heights! We can do MUCH better! Source: <a href="https://www.kpbs.org/news/2019/aug/26/city-heights-kids-take-two-hour-public-transit-jou/">https://www.kpbs.org/news/2019/aug/26/city-heights-kids-take-two-hour-public-transit-jou/</a></p> <p>6. Anti-displacement strategies: Create and fund an anti-displacement strategy to protect vulnerable communities living near transit corridors by preserving existing affordable housing, encouraging community ownership, and protecting tenant rights as well as developing new affordable housing.</p> <p>Thank you for your consideration, and more importantly, SANDAG's prompt, effective, efficient, and just action!</p>	<p>Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p>
E148	Lorna Delos Santos	Pilipino Workers Center	<p>North city area bus # 306 to and from fall brook needs an additional bus route for the public specially on busy days. Additionally a proper bus stop at many areas in this route is needed specially on hot summer time. To mention one in SR-76 highway corner mission near Daniels market. Submitted by Pilipino Workers Center members who are Caregivers. Priscilla Caringal, Ruby Archean, Nilda Chelonia, Rachel Aquino, Anita Sulangi, April Tellez, Arsenia Fabrigas, Susie Ratana, Cherilyn Apolinario, Carmela Hernandez, Lilia Thomson, and Corazon Canatuan.</p>	<p>NCTD is looking closely at adding service to those areas that are in need, also looking into Flexible Fleet solutions that can bridge the gap in areas that need better service. The Regional Plan includes upgrades to Route 306 in 2029, having buses come every 15-minutes.</p> <p>Your comment was forwarded to North County Transit District (NCTD).</p>
E149	Lorna Delos Santos	Samahan Health Clinic	<p>Temecula should be provided with San Diego Bus Breeze because there are many commuters there who want to get to Escondido to work. Temecula/Murrieta maybe part of Riverside county but most people work In San Diego area. A daily route would help. Submitted by Pilipino Workers Center members/Caregivers : Teresita Vale's, Cecilia Bautista, Bernadette Chaffee, Beth Adonai, Pay Igaya, and Cecilia Jaro.</p>	<p>While the Regional Plan does not currently include new fixed-route transit services north of Escondido on the I-15, there may be some new plans that come out of the North County Comprehensive Multimodal Corridor Plan (CMCP) work currently being considered. Carpool and Vanpool options are provided at the iCommute website.</p> <p>Your comment was shared with the North County CMCP team.</p>
E150	Lorna Delos Santos	Samahan Health Clinic	<p>San Marcos area has a few buses that goes to the next neighboring cities specially in West San Marcos Blvd. area. Bus stops are difficult to locate and would take more than 2 miles to get to the next one. Submitted by Pilipino Workers Center members/Caregivers : Beth Adonai, Joan Gastones, Elvira Corbilla, Nemia , and Elma Movila.</p>	<p>NCTD is looking closely at adding service to those areas that are in need, also looking into Flexible Fleet solutions that can bridge the gap in areas that need better service.</p> <p>Your comment was forwarded to North County Transit District (NCTD).</p>
E151	Lorna Delos Santos	Samahan Health Clinic	<p>San Diego-La Jolla-Carlsbad-Encinitas-National City-Chula Vista. Is there a way an easy access to public transport that traverses in these areas anytime at work weeks? Submitted by Pilipino Workers Center members/Caregivers : Nenita Acson, Mercedita Habagat, Emelita Rigor, June Freeman, Cristina Caracalla, Melanie Patti, Beth Dunn, Nieva Javier, Ronalyn Antic, Richard Soria, Eliseo Bautista Jr., and Emma Cannamasco.</p>	<p>The Regional Plan includes multiple new routes that provide connections between these locations. There is a new commuter rail route that will connect National City, Chula Vista, to La Jolla. Multiple new Next Generation Rapid routes that provide connections through the North County Coastal areas mentioned. All routes are planned to operate every 10 minutes throughout the weekdays.</p>
E152	Lorna Delos Santos	Samahan Health Clinic	<p>Need a clean public restroom at main terminal.            Special curbside for bus to unload/load passengers. Audit the bus stop on Highland Ave and 8th St.            Cover shade for bench.            Avoid putting a bus stop too close to stop light.            Well lit waiting area for night riders for their safety.            Special app to show bus arrival.            Can you color coded the bus?            Install a hand sanitizer dispenser inside the bus.            Some bus stayed longer at bus stop. Waiting for more riders.</p>	<p>SANDAG is working with our transit operators on a bathroom analysis of where to put bathrooms. This will be completed in late 2021. All public transit has shade and seating where it can physically be accommodated. The Next OS system outlined in the plan will work toward developing an app with Next Bus information. The transit operators are in charge of the branding and coloring of the bus, sanitation on the bus, and scheduling.</p>
E153	Louise Potash	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. E155	Lyn Pratt	Morse High School; Mid-City CAN	<p>I am a volunteer with Mid-City CAN.</p> <p>Every San Diegan deserves access to high-quality transportation and economic mobility, especially young people ages 24 and under, people with disabilities, and seniors. We urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under receive priority when Transit Fare Subsidies are allocated.</p> <p>* Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region's equitable economic recovery.</p> <p>* No-cost transit passes for all youth ages 24 and under ensures generations of lifelong transit riders are part of our long-term strategy to build a greener and equitable San Diego.</p> <p>* No-cost transit passes will connect youth to school, work, medical care, internships, and other early-career opportunities.</p> <p>I urge the board to take bold action to build a greener, healthier, prosperous, and just future in San Diego. Please amend the Plan to include Youth Opportunity passes as a priority.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. E162	Maria Gonzalez	Southern Caregiver Resource Center/El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>First of all, I want to say thank you for all those who are behind the scenes making some of the upcoming projects come to reality. Faster and more reliable transportation is a vital change San Diegans need. Bringing greater equity to our transportation system while better serving our lower income communities who rely on public transportation for their everyday needs. I am looking forward to the changes that will happen within the freeway system with more lanes designated specifically for buses. As a community outreach worker, a big number of the clients Southern Caregiver Resource Center do not have the financial capabilities of improving their caregiver situations which are more complicated by the lack of faster and reliable transportation between doctor’s appointments and making it to work on time. I am very excited to see and experience all the changes SANDAG has to offer our communities.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfoward.com">SDFoward.com</a>.</p>
E163	Maria Libia Cabrea	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative**</b></p> <p>Esta bien que haga el transporte gratis paralos jovenes. En la calle Main hacer para bicicletas, y en la calle Madison poner mas stop porque pasan los carros muy fuertes, y tabien hacer lineas para bicicletas y tambien hacer en las calle Broadway poner banquetas mas ampleas. And also, in front of the school Naracanca, poner topes porque pasan los carros muy fuertes y ahi pasas ninos.</p> <p>***</p> <p>Its good that they do free transit for the youth. On Main Street put bike lanes, and on Madison Street put more stops because the faster go very fast, and make lanes, and also on Broadway put wider sidewalks and in front of the school Naranca put cones because the cars past by so fast and that’s where the children cross.</p>	<p>Una de las Acciones de Implementación enumeradas en el Anexo B es un Estudio del Impacto Regional de las Tarifas. Este estudio asegurará que las partes interesadas públicas tengan la oportunidad de expresar su opinión sobre las alternativas. Se espera que el estudio finalice en el año fiscal (FY) 2024 e incluirá una evaluación de los subsidios para las tarifas de las personas de bajos ingresos, los adultos mayores, los estudiantes y los jóvenes. Mientras tanto, el personal de SANDAG, MTS y NCTD está trabajando con las partes interesadas en un programa piloto de un año que puede ofrecer tarifas gratis a los jóvenes menores de 19 años.</p> <p>Su comentario ha sido compartido con la ciudad de El Cajon.</p> <p>***</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. 				frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E166	Mark	N/A	<p>Thank you for all the work that went into this. But I must admit, I'm not a fan of all those managed lanes. That is just crazy! Whoever was developing that part of the proposal wasn't thinking about all the regular people who have to get from point A to B every day - commuters. People in cars, who are most of the tax base here in San Diego, need flexibility. They depend on the government to provide basic services including access to transportation. What if you needed to bring a friend or a special solar cup to access the water easily and swiftly from your tap, unless you want to pay huge fees for every glass? Even if you try to implement this a little at a time I fear it will spark a considerable backlash. I like our elected leaders, but this would give plenty of ammunition for foes. Just don't go there, please!!</p> <p>Many thanks, Mark</p>	<p>The intent of the managed lanes is to create a flexible system that can be managed in real time. This is similar to how the I-15 corridor is currently managed in North County today. Solo drivers will have options to use the lanes but at a price and transit services can travel congestion free. The result is better optimization of the system that encourages higher occupancy travel but with real alternatives that are competitive with driving.</p>
E167	Mark and Cathy Steele		<p>To say we have grave concerns regarding the proposed 2021 Regional Plan is an understatement. Establishing "incentives" to coerce the public to give up their right to use their vehicles is abhorrent; VMT fees, reduced parking, parking and curb pricing, diverting funding from the highway expansion and improvement programs to build multi billion dollar mass transit projects, etc.</p> <p>With your forecast in growth in commuting by mass transit from 3 percent to a very optimistic and very unlikely and measly 12.6 percent? This makes no sense whatsoever. We are already dealing with outrageously high gas taxes and roads that desperately need help. Trying to establish these goals will cause a voter revolt.</p>	<p>Thank you for your comment.</p>
E168	Marquelia Villarreal	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative**</b></p> <p>Hola, soy Marquelia a mi me encanta la junta que tuvimos con munidan del la plan sobre todo por la informacion acerca del transporte publico lo que piasan aser en el futuro en El Cajon todos los proyecto a mi en lo personal me gustaria que nos sigan informando y que siga viendo juntas para saber lo que esta pasando perso tambien me gustaria que si pudiera en a ayudar a la comunidad me lo informara gusto ayudar.</p> <p><b>***</b></p> <p>Hello. I'm Marquelia. I like loved the meeting we had with munidan about the Plan, for all the information about the public transportation and what they plan to do in the future in EL Cajon, all the projects to me personally, I liked that they continue informing and that they continue having meetings about everything that's happening, but also I would like to help the community. I like to provide information to help.</p>	<p>Gracias por su comentario. Favor de continuar siguiendo el plan regional a: <a href="https://www.sdforward.com/mobility-planning/2021-regional-plan">https://www.sdforward.com/mobility-planning/2021-regional-plan</a>.</p> <p><b>***</b></p> <p>Thank you for your comment. Please continue to follow that 2021 Regional Plan at: <a href="https://www.sdforward.com/mobility-planning/2021-regional-plan">https://www.sdforward.com/mobility-planning/2021-regional-plan</a>.</p>
E169	Mary Ann Horton		<p>Thank you for providing this plan and seeking community input.</p> <p>I think the community will be extremely reluctant to sign a blank check for twelve figures. We need proof of what works, with a laser focus on how to most economically solve the problem. You can provide evidence using pilot projects and emulation.</p> <p>You suggest several different solutions, bikes, scooters, high speed trains, ride sharing, managed lanes, etc. The public is very skeptical of many of them, believing the bikes, scooters, and trains will be under-utilized. I share that skepticism. A typical driver needs the flexibility to make stops for errands, picking up kids, etc. They need to carry groceries and stay out of the rain. We're already seeing that bikes are not a solution to transportation, they are a form of exercise and recreation. I'm pretty sure scooters are as well.</p> <p>Here's what I suggest: for each of your several solutions, create a pilot project. Emulate the service with a low-cost, quick-to-create service that will move commuters. Run it for some period (6 months or a year) and see if people will use it. Then you'll have a solid case to build the real equivalent service.</p> <p>High speed trains can be emulated with rapid buses running the same routes and schedules at the projected fares. You might be able to address traffic issues by repainting lanes on existing roads to</p>	<p>The 2021 Regional Plan proposes funding for deploying a wide range of Flexible Fleet services, including microtransit and on-demand rideshare services, to provide greater mobility options. SANDAG will begin launching pilots in 2022 to test different opportunities and applications for Flexible Fleets in addition to infrastructure and technology improvements that support the success of these services.</p>

			<p>create mini-managed lanes.</p> <p>Microtransit in automated electric shuttles can be emulated with gas-powered human-driven shuttles at the projected fare. You could also subsidize pooled Lyft/Uber rides if they book the rides using your app. You already have data on managed lanes (I-15) and bike lanes (downtown San Diego).</p> <p>I personally believe that microtransit combined with shared rides would be a low-cost high-acceptance alternative to owning a car. It has to get you there in a competitive time with driving, at a fare low enough to compete with driving (56 cents/mile, per the IRS). The “Expanded trip options” graphic on page 29 illustrates this very nicely. This is also the type of service you can quickly and inexpensively emulate for a pilot.</p> <p>Thanks,</p> <p>Poway</p> <p>P.S. Before I retired, I commuted to SDG&amp;E in Mission Valley. That’s impossible by current transit.</p>	
E170	Mary Storm	McGraw Hill	<p>I am writing to let you know my opposition to the Raised Buffer strip on Gilman. I am a 60-year-old “recreational” cyclist that rides that route several times a week and puts in between 100 – 150 miles a week on my road bike. I have been cycling in San Diego for more than 25 years.</p> <p>My issue with the raised barrier is that it is adding a crash hazard. Gilman is wide enough that I have never felt unsafe on either the North Bound or Southbound side from or to UCSD from the Bike path. I have commuted on that stretch on weekdays, as well as weekends. Once the curb is installed there is no way for cyclists to safely pass each other. Also, the bike lane becomes a collecting point for debris because it can no longer be swept away. Glass bottles find their way into bike lanes, and with that curb can’t find their way out. That’s a long stretch with a flat tire, and no place to pull off to fix..</p> <p>I would prefer to see just a painted barrier lane to give cyclists a bit more space.</p> <p>Is it possible for you to pull accident reports from the stretch of the Coast Highway in Cardiff where the barrier has been added and see if more or fewer accidents have been reported before proceeding ? The lane on the Coast Hwy is now a jumble of bikes, walkers, strollers and is so dangerous I prefer to take my chances with the cars. I know that wasn’t your intent, but if you were to go observe that lane at various times of the day you would see the outcome.</p> <p>I feel like there are many other better ways to use these funds.</p> <p>One thing that does need to be added is some sort of indication to motorists coming off Northbound 5 at Gilman to watch for cyclists crossing onto the bike path. Cars frequently blow past limit line, blocking the access to the entrance to the bike path. Or they plan on turning right on red and directly into our path. Their line of sight up the hill is blocked as we come out from under the 5, and we are moving fast due to the downhill. Perhaps make that a “no right on red”?</p> <p>Thanks for your time, I do appreciate what you are trying to do – make San Diego a first-class city for cycling !</p>	<p>While the Gilman Drive alignment is on the Adopted Regional Bike Network included in this Regional Plan, the specific project you’re referring to (or specific extents / intersections) is within the project limits of the City’s CIP project estimated to begin construction in 2022. Your comments might best be noted and addressed by the implementing department within the City of San Diego, please see webpage here specifically for the Project Manager’s contact information at: <a href="https://cipapp.sandiego.gov/CIPDetail.aspx?ID=S00951">https://cipapp.sandiego.gov/CIPDetail.aspx?ID=S00951</a>.</p>
E171	Maureen Hartin	Volunteers in Medicine/El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>Reviewed the plan and think it will work well for the East region.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
E172	Maya Enciso	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn’t move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to</p>

				increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E173	Melodee Tuskagie	Jamul First Methodist Food Pantry/El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>You don't detail plans for straightening roads. What roads are you talking about? Those of us in rural areas pay the taxes, but we don't get the benefits.</p> <p>What are you doing to make our roads safer? Look at Camp Road in Rancho San Diego area: the lanes go away right where they are needed to be available - specifically between the intersection of Camp Rd/Jamacha Blvd and Avocado Ave.</p> <p>Also, we need passing lanes on Hwy 94 from Campo Rd down to Otay Lakes Rd. There are reports of multiple incidents of cars passing other vehicles using the right shoulder, crossing the double yellow line into oncoming traffic.</p> <p>Quit putting in bike lanes, especially where they are not needed or wanted. The back country roads are not meant for multiple bike riders - especially if they can't follow the laws about riding in single formation - 4-5 bike across a well-travelled road is pure idiocy.</p>	<p>Lane straightening improvements are included on the following corridors: State Route (SR) 76 from Rice Canyon Road to Pala Reservation and Harolds Road to Pauma Rancho. SR 94 from Jamul Reservation to Tecate Road, And SR 67 from Mapleview to Dye Road.</p> <p>SANDAG will continue to work with our partners to identify projects that improve safety along our region's roadways.</p>
E174	Michael Petrivelli	SanDiego350	<p>Your proposed plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>I ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. Thank you.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E175	Michael Verdu	Resident (Encinitas)	<p>Following up on my email from June 6 (below). I wanted to offer a constructive suggestion for how to move forward:</p> <p>Rather than ask for an up-or-down vote on funding the entire 2021 Regional Plan, why not unbundle the largest and most controversial part of the 2021 Regional Plan - the new commuter rail system and its stations - and ask the voters to fund that separately?</p> <p>There are a lot of projects needing funding that will likely get much broader community support, such as moving the railroad tracks off the bluff in Del Mar (to the degree that SANDAG contributes funding for that project), building and maintaining the Central Mobility Hub (providing connectivity from the existing rail infrastructure to the airport), improving roads and bridges, and building new trails. It would be great to increase Coaster and Sprinter frequency and improve bus service to existing train stations. Roll up all of these projects and put them on the ballot as "Phase I", funded by a simple increase to the sales tax. Then make a separate ask of the voters for the commuter rail system and network of stations, as "Phase II", which would also include the specifics of the per-mile fees (how they're assessed and collected) as well as the additional increase in sales tax needed to fund the projects.</p> <p>By breaking up the vote and funding, you'll increase the odds that many critical projects get the money they need sooner, while also getting a clean read on how your community feels about the big new vision for commuter rail and the future of regional transportation behavior. If San Diego</p>	<p>Once the proposed final Regional Plan is adopted, implementing the components in the plan will require many phases that will likely result in going to the voters multiple times to fund different components of the plan. Regarding a road usage charge, SANDAG staff will initiate a study in the next year to work with Board Members, stakeholders, and community members to develop implementation strategies, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. Your comments will be considered as SANDAG considers how to bundle different projects and initiatives as we work towards implementing the plan.</p>

			<p>wants to bet on commuter rail and a multi-modal hub-and-spoke system as the heart of the region's transportation future, then great. And if not, then you don't lose all the other good stuff if and when the voters reject that bigger vision.</p> <p>It would be tragic if the badly needed projects that had the potential to garner more community support were held hostage to the hugely ambitious commuter rail system.</p> <p>Sincerely,</p> <p>Resident, Cardiff-by-the-Sea</p>	
E176	Mike B		<p>I just would like to ask why would anyone with any intelligence ask for more taxes based on how much you drive?</p> <p>The tax on 1 gallon of gas for the amount of vehicles on the road should be an ample amount to take care of business. The people in charge of the money obviously don't know what they are doing already. Why would we give more money to be mismanaged?</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. While the design of the program has not yet been determined, initial assumptions included in the Regional Plan is that the regional road usage charge would be a user-fee for use of roads in San Diego County. So a San Diego County resident would not be charged a San Diego user fee for miles drive in other counties, and residents of other counties would be charged for miles driven in San Diego county. SANDAG will rely on coordination with other agencies in California along with the State Department of Transportation to integrate the selection of technology, collection methods, and account management to ensure a consistent experience for travelers.</p>
E177	Milena LaBarbiera	SanDiego350	<p>I am a current resident of San Diego. While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, we are asking that certain changes be made and that we accelerate this plan to more effectively meet the goals of achieving climate justice.</p> <p>As a young working professional living in San Diego, I rely on proper public transportation to get me to my job and to perform other tasks, such as grocery shopping. We ask that this plan includes 24 hour service and more frequent service so that those who rely on public transportation, like myself, are able to get to their jobs quickly, safely, and without needed added stress.</p> <p>Additionally, we must accelerate this transportation plan because we must combat environmental injustices in our community. Communities of color are the hardest hit by the effects of climate change, and we all deserve to live in a clean, safe, and healthy environment. It is imperative that we take faster action against climate change to protect all people, especially the communities that are the most vulnerable.</p> <p>Thank you for reading my statement. I hope that my words, and those of the other people who have submitted comments, will resonate you, and you will take action to incorporate our asks.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the draft 2021 Regional Plan Appendix H. This list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.</p>
E178	Molly Boyd	N/A	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E181	N/A	N/A	If you are taxing cars for usage of road, you need to tax bicycles...they use roads and have lanes. Tax them too!!!!	The road usage charge is intended to replace the revenue losses from gas taxes in recent years due to more fuel efficient vehicle technology and electric vehicles. Gas taxes are implemented to fund the maintenance and operations of our current transportation system resulting from wear and tear from regular vehicle use, as well as unrealized costs of carbon emissions on the environment. Roadway wear and tear by bicycles is negligible and zero carbon emissions. Currently, gas taxes do not apply to cyclists and the proposed road usage charge would be expected to continue that practice.
E182	Nanci Kelly	SanDiego350	<p>I am submitting this comment on behalf of all the individuals who would like to utilize public transit in San Diego but require improved services and prioritization of the needs of the public, particularly young people. Many years ago I tried to take the bus to work (fortunately, OB still has good bus line access, at least to begin or end ones journey) in the Mission Valley area however a 15-minute drive became a 2-3 hour bus trip (each way!). This is untenable for people who have multiple life/schedule commitments. San Diego has made very little progress in the 50+ years I have lived here and now we have the additional knowledge of the need for public transit to meet the climate crisis. While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E185	Natalie Mladenov	N/A	<p>I have watched the videos about the new 2021 Regional Transportation Plan. As a North County resident, I support this plan. In particular, there is a tremendous need to invest in safe ways for kids, families, everyone to use alternate transportation like bicycles and rapid transit systems, to get around, and especially in low income parts of San Diego where we have NOT yet invested with safe bike lanes and other measures. It is also important to me that we reduce greenhouse emissions for a cleaner environment and provide clean rapid transit for people of all ages connecting ALL of San Diego. I support timely rapid transportation for all San Diego County community members who support San Diego's business community.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
E186	Nicholas Norcross	SD350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E187	Nicole Burgess	BikeSD	<p>Comments regarding RTP</p> <p>For background, I am an active commuter and travel daily by bike. I am a board member of BikeSD and a participating member of QOL. I appreciate the time and opportunity to comment on the 2021 RTP and the dialogue with staff on a regular basis. I applaud the new leadership that has brought new direction to the agency and the overall approach to transportation with more transit.</p> <p>These are my personal comments, however, I will often say we, which identifies the greater number of people that bike and the organizations that support a healthy active transportation network. I support the goal of Safety and am grateful that Vision Zero is part of the RTP framework. Safety must be the priority for every project that is initiated and implemented. I support an equitable plan that prioritizes transportation justice, therefore support the SD Transportation Equity Working Group Transit Line recommendations. I would like to include and stress an important 11th bullet point; the implementation of safe access to transit and ensuring the first and last mile to transit is part of the Mobility Hubs and RTP. With safe active transportation access to transit stations, research has shown that transit ridership can increase 7-12x.</p> <p>"It is often hard to advocate for something if you have no idea about it" This is how I feel with folks from disadvantaged communities, the general public, and even much of the SANDAG staff. As an active commuter that travels daily by bike, I have a full understanding of the benefits and joys of commuting by bike. I know the challenges and I know that San Diego has the potential to be an</p>	<p>The 2021 Regional Plan includes a number of investments in active transportation including the regional bike network, local bike projects through local streets and road funding as well as complete street investments in mobility hubs, mobility hub amenities (including secure bike parking and e-bike charging), e-bike incentive program, and Vision Zero programs. In addition, Appendix B describes implementation actions for the Regional Plan, which includes a Regional Active Transportation Plan (including updated Regional Bike Plan), Comprehensive Multimodal Corridor Plans, Regional Vision Zero Action Plan (including Regional Safety Policy), updating SANDAG grant programs, quick build program for complete streets, and transportation demand management grants and incentives.</p> <p>In developing the mobility hubs, SANDAG ensured each military base is immediately adjacent to a mobility hub area. The proposed final 2021 Regional Plan includes bathrooms at new rail stations and a bathroom access study as a near-term implementation action. The 2021 Regional Plan includes a tunnel for the tracks to be moved from the Del Mar Bluffs.</p> <p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from</p>

			<p>amazing bike mecca where ridership exceeds all expectations. Unfortunately this RTP fails to capture the true value of bikes in such a beautiful city with perfect weather all year round. San Diego has large amounts of street space that can be reallocated to active commuters and we have a large amount of residents that are interested in commuting by bike, especially with the innovation of ebikes. This RTP fails to integrate bikes with transit and capture the true value and synergy of biking. It is unfortunate that this RTP is focused primarily on transit, EV's and shuttles that will one day be autonomous. This RTP fails to have a vision for a large number of folks choosing to go by bike since it lacks an updated bike plan that captures the ridership needed to meet the City of San Diego's Climate Action Plan. It is extremely important for SANDAG and the City of San Diego to update their bike plans so that we can maximize the opportunities and increase ridership. There needs to be grand vision for safe and secure bike parking throughout the region as this is an important component of supporting people who bike.</p> <p>It is hard to see what has been changed for active transportation from previous RTP's. Funding has not changed, projects have not changed with the exception of the addition of the Chollas Creek Regional Park and bikeway. We appreciate this addition as we believe this is the most equitable active transportation project in the region and will drastically improve mobility and outdoor access for the communities that need it most. They deserve a separated and connected bikeway and the 7 miles from La Mesa/Lemon Grove to Downtown would be an amazing asset to our region.</p> <p>I do oppose highway widening for any purpose and am not in favor of the new transit station to Camp Pendleton. I would like to see the ridership numbers and modeling for this station. I personally believe that a safe connected bikeway to this area would be far more beneficial for all. The military is a huge base of commuters in San Diego, approximately 30%, and I believe this plan fails to support this demographic of commuters. With a close partnership, the military can be the leaders of changing the way we move in San Diego. These are the men and women that can protect our homeland while staying physically fit and strong, to meet their goal of Military Readiness. Please discontinue using the word "Faster". Speed kills and is not supporting Vision Zero.</p> <p>I do believe the strategies and programs will be a critical component to change cultural car centric habits in San Diego. I encourage a Healthy Commuter Incentive Program to provide incentives for residents to change the way they move. Charging for parking and congestion pricing will also be extremely effective in changing behaviors. Let's start with 163 as it goes right through our beautiful Balboa Park. This corridor should have BRT with adjacent walking and biking trails. Charging for all curb space and keeping vehicles out of city centers will be critical for vibrant transit friendly communities.</p> <p>Mobility Hubs everywhere with connected bikeways for safe healthy access is so critical. These mobility hubs do not need to be grand; consider a basic stop with shade and seating provided by a structure that has solar power, lighting and electric bikes available as part of the transit system. If the station is well used then a bathroom would be recommended. Health and maintenance of our residents and roadways needs to be considered. When one person uses a bike in lieu of a vehicle (ICE or electric) the benefits are grand and it is unfortunate your modeling is not capturing the positive outcomes of active transportation.</p> <p>Improved health, very little air or noise pollution, streets stay in better condition, people have an opportunity to engage and be social, and our residents and city become safer, healthier, cleaner, and more resilient city.</p> <p>EV's are Not the answer. Electric Bikes Are! As far as Grand Central Station, it can help transform the Midway District, but it is a big expense that does not have a great ROI. I personally believe the station should be closer to the proposed Laurel location with a people mover connecting to the Airport and beyond to Liberty Station, military bases in PL, and the beach area. Above ground air trams, people movers, would be a great addition in San Diego. Tourists and residents would love it. Our scenery and viewpoints around the waterfront are amazing and we should be capitalizing on the beauty. An air tram to and around Balboa Park would be fantastic. I personally am not a fan of an underground subway however I would highly recommend the boring technique to be used for creating safe bikeways across/under our most difficult crossings at highways and waterways. This should be a primary use of underground technology.</p> <p>At this point I would not support a tax measure to fund this plan as it does not properly address the</p>	<p>passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>

Draft 2021 Regional Plan Responses to Comments – Email Sourced

ID	Commentor Name	Agency	Comment	Response
			<p>immediate climate crisis and needs of community members that are suffering the most. The current bike plan is only 3% of the total cost of the entire regional plan. With the low cost to fund and implement a complete connected bike network, these projects should be a priority and be implemented as soon as possible and should be completed by 2035.</p> <p>I support the Coastal Rail Trail and appreciate separated facilities away from the noise and pollution of vehicle traffic. When the tracks are moved from the Del Mar Bluffs and the tunnel is created under Miramar, we recommend that the old tracks be converted into a Rails to Trails project. These are by far, some of the best corridors to ride in the US.</p> <p>I appreciate that the new RTP is a better approach than previous RTP's, however there will be much work to do to actually implement the needed infrastructure to change the car culture of San Diego. I do believe with a new bold bike vision and the prioritization for healthy active transportation, our city can achieve, and even exceed, the desired mode share goals of 18% by 2030. I would like to suggest that SANDAG evaluate the most difficult and dangerous areas to ride a bike. As I have experienced, most of the dangerous locations are around and through highway interchanges. Perhaps a new approach to our bike improvements is for SANDAG to address these hot spots specifically, working with Caltrans and Cities to make these areas safe to help connect our communities. As SANDAG focuses directly on these dangerous intersections with Caltrans, the City can support "quick build" protected bikeways that approach these areas. For example, rather than have SANDAG address the entire 2.5 mile corridor of Nimitz, I would prefer they focus on the most dangerous area near the I-8 and efficiently implement a grade separated facility for connecting at this hot spot, while allowing the City of SD to add flex posts and barriers along the rest of the corridor to provide the safer facility in a more reasonable timeframe. With a Vision Zero priority at SANDAG, money cities receive from SANDAG should be dedicated to complete streets using Vision Zero Strategic Solutions for Safety.</p> <p>The collaboration between cities, Caltrans and other agencies is extremely valuable to being successful and commend staff for working on all fronts to address the transportation issues in the region. We have amazing new leaders throughout San Diego County. For them to continue to be great leaders and ensure a holistic transportation system is created, these leaders need to experience all modes of transportation. The Board of Directors, Transportation Team and SANDAG staff should all be using the current transit system and bikeways to truly understand the benefits and challenges of each. If they only drive a car, they will only know how to advocate for such. SANDAG can help facilitate this and it is important that our leaders ride the Coaster, Sprinter, BRT, Blue Line and the bus to understand what we have and don't have in San Diego. Leaders need to actively ride a bike to understand and feel why there is such a demand for separated and protected facilities. This is the best way for our leaders to be advocates for an inclusive and healthy transportation system.</p> <p>I truly appreciate the opportunity and continued dialogue for a safe, healthy, and efficient transportation plan for our region. The Climate Crisis is real and we have limited time. The best ROI is to prioritize people centric communities with bikeways connecting these people, businesses, and amenities in our City. Be inspired by Mayor Anne Hidalgo in Paris and watch how she has changed her city in the last two years. This is possible here in San Diego and we too can act quickly to be successful to get people out of their cars. San Diego is shining and people want to ride for transportation. It is time to provide the safe network for them to do so.</p> <p>May our commutes become the best part of our day.</p>	
E188	Nicole Mu??oz-Proulx	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>1. Accelerate GHG reduction goals: Meet the required greenhouse gas emission targets, and ensure measures get us to those goals using federal and state funds available to create high-quality union jobs. Climate change is accelerating, and we are currently seeing the results, which are especially devastating to environmental justice communities. We can't wait any longer to take the actions needed, so our families and our children have a livable future. The emissions reduction goal in the plan of 40% by 2030 is inadequate in addressing the climate crisis.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>

E189	Nicole Mu??oz-Proulx	SanDiego350	<p>2. Accelerate transit improvements: Accelerate the timeline for all transit (trolleys, buses, rail) and biking infrastructure improvements and prioritize the Environmental Justice communities that need transit solutions the most. Environmental Justice communities, who disproportionately suffer from the effects of climate change, cannot afford to wait; they need immediate improvements while the long-term infrastructure projects are being planned. This means no new roads and specifically accelerating the purple line and collaborating with MTS to improve the blue line that serves these communities. This also means transitioning transit to zero-emission vehicles. 24-hour service and increased transit frequency: Make the transit system fast, frequent, reliable, and accessible by increasing passenger capacity, hours of service, and frequency on popular lines. This means 24-hour service and 10-minute frequency on many popular bus and trolley routes to connect people to jobs, school, and more.</p> <p>Improve transit amenities: Make immediate improvements to amenities at transit stops, including benches, shade from the elements, and bathrooms that are accessible according to ADA regulations. Improving transit amenities increases ridership and is crucial to providing our disabled community access to public transportation in an equitable way.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 through 2050 of \$657 million for zero-emission buses and infrastructure, which is to support accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p>
E190	Nicole Mu??oz-Proulx	SanDiego350	<p>3. No-cost youth passes: Provide no-cost transit passes for youth 24 years old and younger beginning in 2023, not 2027. No-cost transit passes encourage significant participation in public transportation and help shift expectations for how San Diegans use transit.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E191	Nicole Mu??oz-Proulx	SanDiego350	<p>4. Anti-displacement strategies: Create and fund an anti-displacement strategy to protect vulnerable communities living near transit corridors by preserving existing affordable housing, encouraging community ownership, and protecting tenant rights as well as developing new affordable housing.</p>	<p>Land use authority is reserved to local jurisdictions –the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p>

E194	Patricia Valiton	N/A	<p>With so much attention to San Diego County's future transportation, what is SANDAG doing right now to ensure the health and safety of current passengers?</p> <p>This PBS article (<a href="https://www.pbs.org/newshour/nation/public-transit-post-pandemic">https://www.pbs.org/newshour/nation/public-transit-post-pandemic</a>) describes improvements other cities are currently making to their public transportation protocols -- additional cleaning, better air circulation, increased distances between passengers. I understand that even with the new California COVID plans going into effect tomorrow, all public transportation will continue to require that passengers wear facial coverings (which in my very limited experience riding on San Diego busses lately is not universally applied or enforced). So what is SANDAG doing to ensure that current as well as future passengers are assured rides without health risks?</p>	<p>Public transportation vehicles and facilities receive regular maintenance. As part of the COVID-19 protocols, vehicles are wiped and cleaned at the end of each run throughout the day. Additionally, all riders are required by federal mandate to wear a face covering or mask while on public transit.</p>
E195	Paula Holland	N/A	<p>I call for an improvement in the bus system now that is fast, frequent, reliable, and accessible through increasing frequency on popular lines, especially overcrowded ones. Therefore, I call for more clarity in Appendix A: Transportation Projects, Programs, and Phasing that provides a list of specific improvements to the bus system.</p> <p>I call for increased funding for electric bus/trolley system.... better for less green house gas emissions.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. E196	Paula Jewell	N/A	<p>I am a resident of Cardiff and I live just off the Birmingham Drive exit. I took a deep dive into Appendix A of the 2021 Regional Plan, and I wanted to share my questions and comments with you that I also submitted to the SD Forward website. I am very pro active transportation and love to use Class IV protected bike lanes and Class 1 multi-use facilities and would like to see more of these in San Diego County. The multiple transportation projects near my home have piqued my interest in the transportation projects in San Diego. I have been following the projects in North County since I</p>	<p>Yes, we have worked with our project partners at Caltrans to include the North Coast Bike Trail projects in our Final 2021 Regional Transportation Plan as part of the Adopted Regional Bike Network. Caltrans will be the implementing agency working along with the individual jurisdictions to complete their segments of North Coast Bike Trail as per the NCC PWP/TREP.</p>

**Draft 2021 Regional Plan Responses to Comments – Email Sourced**

ID	Commentor Name	Agency	Comment	Response
			<p>will be using them much more than others. I have been enjoying the Coastal Rail Trail for local trips in Encinitas and I am really looking forward to the completion of the North Coast Bike Trail that will be a Class I multi-use path between Birmingham Drive and Solana Beach.</p> <p>Below are my comments and questions that I also submitted to the SD Forward website:</p> <p>North Coast Bike Trail: It seems like the North Coast Bike Trail is a regional active transportation project that should be included in the 2021 Regional Plan. Why isn't the North Coast Bike Trail included on the list of active transportation projects in the 2021 Regional Plan?</p>	
E197	Paula Jewell	N/A	<p>I-5 Widening: I am a 4th generation Californian. I can remember my parents and relatives talking about freeway widening projects since I was a small child. They would always lament that the widening was not enough for future use. Why don't the transportation planners account for future use, not just 2 years after completion they would complain. We now know that widening freeways just induces demand to drive more and does not reduce congestion. I am not clear on whether the future SANDAG projects will widen the I-5 in North County beyond the Phase 1 portion of the Coast Corridor Public Works Plan / Transportation &amp; Resource Enhancement Program (NCC PWP/TREP). I don't think the 2021 Regional Plan should include the widening of the I-5 corridor. From multiple past projects, we know this will not reduce traffic congestion in the long run. Additional freeway size will just increase the noise we hear or air pollution my family breathes in.</p> <p>The 2021 Regional Plan should not include the widening of the I-5 freeway. This project will not reduce traffic congestion in the long run. Is the Phase 2 portion of the I-5 freeway widening proposed in the 2021 Regional Plan? If so, what projects are proposed?</p> <p>I-5 Bike, Pedestrian and Safety Enhancements: If the Phase 2 portion of the I-5 Widening is not proposed in the 2021 Regional Plan, will the other community enhancements still be proposed? SANDAG should not remove the pedestrian, bike and safety related community in the 2021 Regional Plan that were proposed in original EIR for the NCC PWP/TREP. Below are a few specific community enhancements in Encinitas that should be proposed.</p> <p>In the 2015 SANDAG Regional Plan, the Birmingham Drive bridge was scheduled for replacement in a future phase of I-5 construction (estimated 2035 per the 2015 SANDAG Regional Plan). During this time, there were plans to widen the westbound sidewalk from 5 to 12 feet and add a new 12-foot eastbound sidewalk. Roundabouts were also proposed at northbound and southbound intersections at Birmingham Drive. However, these are scheduled to be completed along with the replacement of the Birmingham Drive overpass replacement and future improvements. There were also plans for portions of the North Coast Bike Trail to become a Class 1 facility.</p>	<p>We have worked with our project partners at Caltrans to include the North Coast Bike Trail projects in our Final 2021 Regional Transportation Plan as part of the Adopted Regional Bike Network. Caltrans will be the implementing agency working along with the individual jurisdictions to complete their segments of North Coast Bike Trail as per the North Coast Corridor Public Works Plan/ Transportation and Resource Enhancement Program</p>
E198	Paula Jewell	N/A	<p>Are any improvements to the Birmingham Drive overpass or the other bike and pedestrian community enhancements that were proposed in the NCC PWP/TREP included in the 2021 Regional Plan? Many of these projects will create safe off-street paths that will complete the network for people on bikes and walking and should be included in future transportation planning.</p>	<p>Yes, we have worked with our project partners at Caltrans to include the North Coast Bike Trail projects in our Final 2021 Regional Transportation Plan as part of the Adopted Regional Bike Network. Caltrans will be the implementing agency working along with the individual jurisdictions to complete their segments of North Coast Bike Trail as per the NCC PWP/TREP.</p>
E199	Paula Jewell	N/A	<p>Coastal Rail Trail (CRT): According to Figure A.12 in Appendix A of the 2021 Regional Plan, there are small gaps in the CRT that are not scheduled for completion until 2050. The CRT will be a major bike and ped corridor that will greatly improve the quality of life and allow people to access the beach without using a car.</p>	<p>Each city can prioritize improvements through their active transportation or sustainable mobility plans for segments like these and complete improvements there sooner. SANDAG is committing to make these smaller spot improvements by the 2050 phase year but there are a number of projects that we are working on sooner that constrain the amount of time and budget we can commit to projects throughout the region. As you may well know we recently completed a new segment of the Coastal Rail Trail in Encinitas and will be extending it further north in coming years. Please sign up for updates and learn more here: <a href="https://www.keepsandiegomoving.com/RegionalBikeProjects/Introduction.aspx">https://www.keepsandiegomoving.com/RegionalBikeProjects/Introduction.aspx</a>.</p>
E200	Paula Jewell	N/A	<p>Small gaps in regional bike projects (AT073, AT074 and AT122) should be moved to the year built in 2035 to accelerate safety and access for all users. Additionally, any advancement to complete the network of bike/ped projects should be prioritized in the 2021 Regional Plan.</p>	<p>The bike network shown in the plan is the Adopted Regional Bike Network, which was adopted in 2010. As an early action out of the 2021 Regional Plan, SANDAG will develop a new Active Transportation Plan which will look at adding in a number of new connections like these. SANDAG prioritizes community engagement and will develop</p>

				these connections in partnership with the community so that we can make sure the routes take people where they want to go.
E201	Paula Jewell		I will not have access to the internet on Tuesday June 15 and will be unable to attend the North County Coastal virtual Informational open house on zoom. Will the meeting be recorded? If so, where will this be located online? Will the other open houses be recorded and available online?	All public hearings and informational open houses held during the public comment period were recorded and can be viewed in both English and Spanish at: <a href="http://www.sdforward.com/about-san-diego-forward/calendar">www.sdforward.com/about-san-diego-forward/calendar</a> .
E202	Peggy Griffith	N/A	<p>This proposal is going to punish those who can afford it least. People who cannot afford to live inside the city of San Diego already &amp; have to commute from out of town will suffer the most. Folks who have more money &amp; live nearby will never have to pay as much tax. This will be the tipping point for many young people to move from San Diego. The service industry will suffer even more, except those workers who come from Mexico. How fair is that?</p> <p>You say this tax will eventually replace the existing gas taxes. There is nothing more permanent than a temporary tax. Stop the current tax, then I'll consider thinking about a possible new tax.</p> <p>We just passed a gas tax for \$.12 a gallon a few months ago. For roads. What the heck happened to all that money?</p> <p>This is insane. I'll be protesting more gas tax on the steps of your offices if this idea continues.</p> <p>-Overtaxed tax payer</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as rural residents, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system. For example, drivers of fuel-powered vehicles in the state of Oregon receive a credit for fuel tax and remote emissions testing through their road usage charge program called OReGO.</p>
E203	Phil Birkhahn	SanDiego350	<p>ENHANCED BLUE LINE INSTEAD OF 3RD TRACK EXPRESS  p. A-14, Projects TL13, TL57 p. A-15, Project TL12  Phil Birkhahn, Member of SD350 Transportation Committee philbirkhahn@gmail.com</p> <p>We need a stronger Blue Line to serve its many passengers and get ready to work in partnership with the new Purple Line in 2035. Fortunately, the 2021 RTP Appendix A already shows \$1.02 billion for Blue Line improvements, not counting \$200 million for the San Ysidro Mobility Hub. Blue Line needs a clear path for evolution leading to faster service on a Blue Line Express (BLE). However, BLE did not get fresh analysis for the draft 2021 RP. What follows is a reconnaissance through the factors that need careful consideration before proceeding.</p> <p>I do not believe 3rd Track Express is the right approach other than to frame the issue. Trolleys on a 3rd track could save time by enabling trolleys to bypass a station without slowing down or stopping. Other than that, it would be subject to the same conditions along the route that limit trolley speed today. Station skipping does not even need a 3rd track. Surfliner runs through the Encinitas station at 50 to 60 mph and the two LOSSAN tracks carry diverse traffic.</p> <p>3rd track is probably not a must for freight service either. The 2am to 4am window for freight should be compatible with 30- to 60-minute BLE frequency. Freight would run on the east track and BLE on the west. Both express service and freight on the Blue Line can run separately on the existing two tracks. Since 30-minute frequency on Blue Line starts at 11:30pm, the freight window might even be expanded.</p> <p>Through evolution, I believe Enhanced Blue Line can reduce travel time as much as 3rd Track Express. Instead, enhancements called "channelization" of the existing double tracks would enable full use of the 55-mph cruising speed and 3 mph/second acceleration of the S700 trolley cars. Elevated viaducts, i.e., long bridges, are one example. Track beds elevated on 5 to 10 feet of soil contained within vertical retaining walls on both sides is another. Even fencing has a role.</p> <p>The existing travel time of 34 minutes could be reduced about 8 minutes. I think 26-minute travel time qualifies as a better Blue Line Express than 3rd Track, which skips stations. Skipping could be a difficult public process that might be good to avoid.</p> <p>For now, everyone's Blue Line choices are speculative, including mine seen here. We need a process like the Blue Line Express Service Analysis identified at a recent meeting of the SANDAG</p>	<p>The 2021 Regional Plan includes increased service spans (longer hours of service) for the trolley and buses up to twenty hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24 hours. The Regional Plan also prioritizes early implementation of increased frequency on existing transit lines and upgrading many routes to Next Generation Rapid routes which increased frequency and spans of service. Also, SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B).</p>

			<p>Transportation Committee. Except on steroids with broad reach into alternative evolutionary paths. That process demands full sharing of information with the public, for example, several years of train movement records for the freight operation in the middle of the night.</p> <p>SANDAG and MTS must collaborate on upgrades to Blue Line. First step is a joint comprehensive technical report arriving at the best combination of vehicles, new construction and specific operating plan that would enhance service. Rigorous modeling of each train movement in proposed alternates is necessary to keep hopeful goals from becoming unrealistic and expensive expectations.</p> <p>Please answer the following questions, offer information, and comment where you like:</p> <ol style="list-style-type: none"> <li>1. Will SANDAG and MTS commit to a joint comprehensive report to the public in SANDAG's Blue Line Express Service Analysis?</li> <li>2. Will the above report provide full and complete analysis to the public about alternative evolutionary paths for Blue Line?</li> <li>3. Will the above report recommend the best combination of vehicles, new construction, and specific operating plan?</li> <li>4. Will SANDAG research and provide a list of LRT systems that use bypass or run-through tracks to skip stations to reduce travel time?</li> <li>5. Will SANDAG support the above work with rigorous modeling of each train movement in proposed alternates that is necessary to keep hopeful goals from becoming unrealistic and expensive expectations?</li> </ol>	
E204	Phil Birkhahn	SanDiego350	<p><b>BUILD THE WHOLE PURPLE LINE BY 2035</b>  p. A-12, Project TL02; p. A-14, Project TL03  Phil Birkhahn &amp; SD350 Transportation Committee, Bee Mittermiller, Chair philbirkhahn@gmail.com</p> <p>We need the whole Purple Line Fast Commuter Rail by 2035 instead of splitting it into two projects, which delays completion to 2050. Building just part of the line by 2035 will isolate it from half its commuter market, leading to low early ridership for 15 years that invites criticism of the project and its technology. The second part might get canceled. Luckily, it is a bargain at less than 20% of the total cost.</p> <p>The SANDAG proposal for Purple Line is fast service from Sorrento Mesa to the border in modern commuter trains like the Siemens Mireo or Desiro City powered by electricity.</p> <p>The social purpose of Purple Line is to connect Environmental &amp; Economic Justice Communities south of I-8 to Tijuana, to job and education centers at I-8 and north to Sorrento Mesa. The technical transit purpose is to bring practical travel times to large numbers of inland and southerly commuters.</p> <p>The transit equity purpose is to provide north-south transit to inland San Diego for the first time. Coastal service (Blue Line and Coaster) and east-west service (Orange and Green Lines) has been in place for decades, while inland towns and neighborhoods have close to zero north-south connection by transit. Their travel demand is met by freeways alone.</p> <p>The global warming purpose is Purple Line's ability to serve two to six times as many riders as trolley technology at three times the speed using 100% renewable energy. The trains have a single interior space and all amenities a passenger could want. It's a powerful builder of transit mode-share.</p> <p>Purple Line will likely have a dozen stations over its 30 miles: Sorrento Mesa, UTC, Kearny Mesa, Linda Vista, SDSU West, City Heights, Orange Line &amp; Euclid, National City, Chula Vista Downtown, Palomar &amp; 4th or Chula Vista East at I-805, Iris or Palm, and San Ysidro.</p> <p>It will provide 30-minute travel times from the border to Sorrento Mesa. South Bay commuters headed that far north will choose it instead of a trolley ride of an hour or more. Blue Line will primarily serve Downtown residents working in UTC and Sorrento, and South Bay residents working Downtown.</p> <p>Purple Line is divided into two projects at National City:  National City to Sorrento Mesa TL02 p. A-12 \$12.660 billion 2035 Completion  National City to the Border TL03 p. A-14 \$ 2.977 billion 2050 Completion</p> <p>The SANDAG proposal for Purple Line Commuter Rail is \$15.637 billion for Sorrento Mesa to the border, about 30 miles. That is a lot of money but is less than the alternative of roughly \$25 billion in new lanes needed to fix commuter-rush freeway congestion and keep traffic flowing at 60 mph</p>	<p>A station at I-805 and Palomar is difficult to do. There are high frequency power lines overhead and a significant water line underground. The majority of the ridership for the purple line comes from the denser community areas which are mostly located west of I-805. Station sites will be identified during the advanced phase of the project. At that point, communities will be engaged in the planning effort. SANDAG will pursue all available opportunities to expedite the full Purple Line.</p>

			<p>until 2050.                      Most freeways would need two or three new lanes each way, which means taking a butcher knife to adjacent neighborhoods. That leaves permanent damage that never heals. Purple Line Fast Commuter Rail is 80 percent in deep tunnels. Purple Line is a great way to preserve and serve neighborhoods instead of destroying them.                      The ridership value of those last four stations, Chula Vista Downtown to San Ysidro, is about half the accessible travel market. They are a bargain at \$2.977 billion, just 19% of the total cost of the Purple Line.                      That \$3 billion should come from recapitalizing the Del Mar Tunnel. Tunnel funds should come from a new budget category under Capital Projects called Climate Change Adaptation and funded independently of any source of transit funds.                      Please answer the following questions, offer information, and comment where you like:                      1. Have you considered a station in Chula Vista East at I-805 &amp; Palomar or similar site? If not please evaluate it.                      2. When will SANDAG have recommendations on station sites and when should communities start working on it.                      3. Will SANDAG undertake a special study to find a strategy leading to the whole Purple Line by 2035.</p>	
E205	Phil Birkhahn	SanDiego350	<p>ENHANCMENT PROGRAM LEADING TO A BLUE LINE EXPRESS                      p. A-14, Projects TL13, TL57 p. A-15, Project TL12</p> <p>I assume overcrowding reports are correct. MTS should post station ridership and entry-exit tables like those provided by BART so anyone can deduce the situation with a little work.                      Early Action to 2025                      A. Quickly establish a pilot program of bus service from 1 to 4am to complete 24-hour service. The pilot should be free to passengers to draw out the market and include some free rides to the station for passengers with problematic routes to the station. Use the pilot data to study an upgrade from bus to trolley in the Blue Line Express Service Analysis.                      B. Increase passenger capacity by adding a fourth S700US LRT car to Blue Line trains. This solves the immediate overcrowding problem but will be quickly outgrown unless train frequency eventually can be boosted to at least 12 per hour. If not, go to a Strategic Solution of changing to S700 full-length cars. Is there room to park longer trains at the rail yard south of Imperial?                      C. For now, accept the 25-mph travel speed of the existing Blue Line to Downtown. It already meets SANDAG's 30-minute access criterion to a Tier 1 Job Center for passengers as far south as Iris station if they live nearby. Beyer and San Ysidro are just a few minutes more.                      For 2025 to 2030 Completion                      D. Go ahead with the 5 grade separations funded in the draft 2021 RP for 2035 completion but recognize that the effect at those locations will be to speed up car traffic, not the trolley. As such, the grade crossings should be funded by road funds not Transit Leap.                      E. The Transit Leap funds for the Blue Line already in the 2021 RP should instead be spent on five bilevel stations integrated into their adjacent rail overpass. The track will already be elevated because the grade separation abuts the station. Maybe 1 minute saved.                      F. The stations should be state-of-the-art, including bathrooms on both levels. The upper level would be restricted to passengers holding valid tickets to ride, as is done at the Grantville station. A fence between the tracks would keep people off, like in the SDSU station.                      ALTERNATIVE: Alstom's Citadis Dualis, Metropolis, or X'Trapolis cars can have restrooms on board and have wide connections between cars creating a single interior space. Restrooms would not be needed at the upper boarding level of stations.                      G. Determine the potential for bilevel stations to enable skipping a station at higher speed found in Encinitas on LOSSAN. Bypass tracks may not be needed. Note that Surfliner trains go through Encinitas station and nearby crossings at 50 to 60 mph.                      Consider for 2050 Completion                      H. Elevate or otherwise isolate the trolley tracks from "H" Street to 12th &amp; Imperial. This section is the slowest part of the Blue Line south of Downtown, 22 mph. Saves about 5 minutes, putting San Ysidro within 30 minutes of Downtown.                      The above measures would lower travel time to about 29 minutes from the current 34 minutes, no</p>	<p>The 2021 Regional Plan includes increased service spans (longer hours of service) for the trolley and buses up to twenty hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24 hours. 			<p>stations would be skipped, and travel speed would be 29.4 mph. Isolating tracks on from San Ysidro to “H” Street could save 3 or 4 more minutes.                      Please answer the following questions, offer information, and comment where you like:                      1. Will SANDAG and MTS commit to a joint comprehensive report to the public in SANDAG’s Blue Line Express Service Analysis that includes a specific phased program leading to steady progress toward a Blue Line Express?                      2. Will SANDAG support the above work with rigorous modeling of each train movement in proposed alternates that is necessary to keep hopeful goals from becoming unrealistic and expensive expectations?                      3. Will SANDAG determine if the achievable travel time reduction is sufficient for Blue Line to be a strong partner for the Purple Line?                      4. Will SANDAG consider conversion to faster vehicles with more amenities like those offered by Alstrom?</p>	
E206	Phil Birkhahn	SanDiego350	<p>DEL MAR TUNNEL IS CLIMATE CHANGE ADAPTATION NOT TRANSIT                      p. A-26, Project TL06                      Phil Birkhahn, Member of SD350 Transportation Committee philbirkhahn@gmail.com</p> <p>Del Mar Tunnel is an expensive, \$3-billion project required for adaptation to sea-level rise caused by climate change. Sea level had held steady for two- or three-thousand years before erosion of the coastal bluffs was initiated by global warming. Goods movement and transit needs could have been met by double tracking the existing route. We need a new budget category called, “Climate Change Adaptation” to recognize reality, bring visibility to the cause of the spending, and seek special funding sources not related to goods movement or transit. Budget presentations in Appendix A and throughout the Regional Plan necessarily group projects leading to wide interpretive differences. Case in point is TRANSIT LEAP, \$51.637 billion. This breaks down as follows:                      CATEGORY COST, billions COMMENT                      New Commuter Rail Routes \$33.680 Mostly in deep tunnels                      Improve Existing Heavy Rail \$6.949 LOSSAN: Freight, Surfliner, Coaster                      Climate Change Adaptation \$2.630 Move tracks from Del Mar coastal bluffs                      Improve Existing Light Rail \$3.088 Trolley and Sprinter                      New Tram Loop \$1.175 Downtown-Hillcrest-North Park-Golden Hill                      Rapid Bus \$2.717 35 New and Existing Route Improvements                      Airport People Mover \$1.398 San Diego International Airport                      The real cost of Transit Leap will be lowered to \$49.007 billion by properly moving Del Mar Tunnel to the new budget category of Climate Change Adaptation.                      Note that new commuter rail routes are only \$33.680 billion, far lower than reported by news media. That is for the Purple Line from Sorrento Mesa to the border, the east-west line from Central Mobility Hub to Hillcrest to El Cajon, and the line from Downtown to Hillcrest to Linda Vista. Maps in the Regional Plan are not drawn to reflect distinctions between category of project, such as New Commuter Rail versus Existing Heavy Rail. And projects not in the Regional Plan at all are shown on some figures without differentiation, for example California High Speed Rail.                      Please answer the following questions, offer information, and comment where you like:                      1. Will SANDAG create a new budget category for Climate Change Adaptation and take such projects out of Transit Leap?                      2. Will the estimated cost of Transit Leap be \$49.007 billion?                      3. Will the estimated cost of the three new Commuter Rail lines be \$33.680 billion?                      4. Will SANDAG enhance existing maps and figures in the Regional Plan to highlight the above differences in project type and cost allocation?</p>	<p>1) No. Moving projects out of the transit category could compromise the ability to successfully obtain grant funding.                      2) No, see #1.                      3) No.                      4) No.</p>
E207	Phil Birkhahn & Bee Mittermiller	SanDiego350	<p>CITY HEIGHTS ON PURPLE LINE FAST COMMUTER RAIL                      p. A-12, Project TL02; p. A-14, Project TL03; p. A-29, Project TL01                      SANDAG’s commuter rail network in its draft Vision for the 2021 Regional Plan Network Development Summary Report, released August 7, 2020, had a big surprise: City Heights was off the</p>	<p>The revisions to the Purple Line were adopted in the SB2S CMCP. Unfortunately, the network modeling and EIR were developed prior to this change being included in the network. The Regional Plan mentions the change to the Purple Line in Appendix A, but the network maps and figures will not be updated.</p>

**Draft 2021 Regional Plan Responses to Comments – Email Sourced**

ID	Commentor Name	Agency	Comment	Response
			<p>Purple Line, North Park and University Heights were on. Purple Line has always included City Heights on its run to Kearny Mesa, UTC and Sorrento Mesa from Environmental &amp; Economic Justice Communities south of I-8 to Tijuana. The other surprise was that North Park was not included in the east-west line from University Heights on its way to City Heights.</p> <p>By September I was working with San Diego Transportation Equity Group to get City Heights back on the Purple Line. Equity is prime, but my original objection to the change was its decreased capacity relative to large-scale traffic flows on I-15, I-805, SR-163 and I-5. It adds up to 700,000 cars per day through the zone between SR-52 and SR-94</p> <p>Moreover, the Purple Line route proposed by SANDAG merged with the other north-south route coming from Downtown to Hillcrest, Kearny Mesa, and Sorrento. I objected to that network design because eventually two north-south routes are needed from SR-52 to SR-94. North and south of that zone, just one route is needed to match the market.</p> <p>SANDAG's configuration to the south is great, bringing routes together at National City to head south to the border. The SANDAG configuration to the north is problematic. Bringing them together at University Heights to continue north as one route to Mission Valley and points north deprived the area from I-8 to SR-52 of the additional route it needs. It gives up a large chunk of the potential market.</p> <p>I define need as offering congestion reduction on the four north-south freeways and having potential for high mode shift from cars to Fast Commuter Rail. Purple Line is an opportunity to provide travel time less than 30 minutes from the border to Sorrento Mesa. Even during the height of the commuter rush. No freeway will ever be able to do that.</p> <p>When we got SANDAG to commit to putting City Heights back on Purple Line, they proposed a good route through a station at SDSU West and then to Linda Vista, and Kearny Mesa. SDSU West may need an above ground site because an underground station would face poor subsurface conditions could have a cost impact.</p> <p>My last point is that North Park deserves a Fast Commuter Rail station. Luckily, SANDAG already plans and budgets for a tunnel from University Heights to City Heights. It will pass just half-a-mile north of North Park. Please modify that project by slightly diverting the tunnel to a North Park Station. I believe direct connection to City Heights, SDSU and points east will be better for North Park than direct connection to points south.</p> <p>Please answer the following questions, offer information, and comment where you like:</p> <ol style="list-style-type: none"> <li>1. For project TL02, will you delete "University" and add "City" in its description?</li> <li>2. Will the figures in the final RP be updated?</li> <li>3. Does SANDAG agree that the zone for heaviest north-south traffic stretches from SR-52 to SR-94?</li> <li>4. Has SANDAG estimated the cost and consequences of trying to solve traffic jams with enough added lanes to eliminate commuter-rush congestion and keep traffic moving at greater than 60 mph until 2050? Should Caltrans perform such a project?</li> <li>5. Has SANDAG conferred with SDSU West about modifying their plans to include a fast commuter rail station?</li> <li>6. When will SANDAG model the rail operations to pin down travel time between each station pair and end-to end?</li> <li>7. Will SANDAG publish estimated ridership contributed by each station for 2035 and 2050?</li> <li>8. Will you add a Fast Commuter Rail connection at North Park using funds in already in Project TL01 for the tunnels and Project TL02 for the station?</li> </ol>	<ol style="list-style-type: none"> <li>3) There are several "zones" in the region with significant traffic – SR 52 to SR 94 are high on the list of most congested but it is not the most congested.</li> <li>4) No, SANDAG has not done that analysis. The RP does not included additional freeway lanes that would warrant that analysis.</li> <li>5) SANDAG is working with SDSU on a potential station site. The exact location of that station will be developed during the advanced planning stage.</li> <li>6) SANDAG will conduct the analysis of travel time between stations during advanced planning. Modeling has been completed that results in a total travel time.</li> <li>7) SANDAG does not generally publish station ridership at the Regional Plan stage because the exact locations of stations has not been defined, just the area's a station would be placed.</li> <li>8) No.</li> </ol>
E208	Priscilla Lane	SanDiego350	<p>I am close to a bus line but it takes a very long time to get where I'm going by bus. We should strive to make transit competitive with driving. While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, give priority to transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. This is essential especially for those who rely on transit as their only means to get around.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including</p>

E211	Rami Ibrahim	Majdal Center, SD350	<p>Many community members in East County are walking communities with no access to transportation. Many walk in 100 degree heat, and vulnerable community members face health risks when merely engaging in movement. First, we need to Accelerate transit improvements: Accelerate the timeline for all transit (trolleys, buses, rail) and biking infrastructure improvements and prioritize the Environmental Justice communities that need transit solutions the most. Environmental Justice communities, who disproportionately suffer from the effects of climate change, cannot afford to wait; they need immediate improvements while the long-term infrastructure projects are being planned. This means no new roads and specifically accelerating the purple line and collaborating with MTS to improve the blue line that serves these communities. This also means transitioning transit to zero-emission vehicles.</p>	<p>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</p> <p>The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p>
E212	Rami Ibrahim	Majdal Center, SD350	<p>As a UC San Diego student, I was frequently taking the bus home from work at odd times in the night. Waiting for over 25 minutes at a bus stop made me uncomfortable and made me feel unsafe. We need 24-hour service and increased transit frequency: Make the transit system fast, frequent, reliable, and accessible by increasing passenger capacity, hours of service, and frequency on</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights,</p>

## Draft 2021 Regional Plan Responses to Comments – Email Sourced

ID	Commentor Name	Agency	Comment	Response
			popular lines. This means 24-hour service and 10-minute frequency on many popular bus and trolley routes to connect people to jobs, school, and more.	<p>and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements. SANDAG will be working hard with the help of all of our passengers and representatives to ensure that this plan gets implemented.</p>
E213	Rami Ibrahim	Majdal Center, SD350	Many community members have accessibility needs that need to be met when taking public transportation. Public transportation must be accessible to ALL. Please Improve transit amenities: Make immediate improvements to amenities at transit stops, including benches, shade from the elements, and bathrooms that are accessible according to ADA regulations. Improving transit amenities increases ridership and is crucial to providing our disabled community access to public transportation in an equitable way.	SANDAG agrees that amenities are important on public transportation. That is why all of the new services planned in the regional plan will include shade structures and benches. Bathrooms are being evaluated in a study to determine where they can be placed or upgraded to meet ADA requirements.
E214	Rami Ibrahim	Majdal Center, SD350	Next, we need No-cost youth passes: Provide no-cost transit passes for youth 24 years old and younger beginning in 2023, not 2027. No-cost transit passes encourage significant participation in public transportation and help shift expectations for how San Diegans use transit. At UC San Diego, bus and transit passes were provided with our tuition. However, many students and youth are not enrolled or have the funds to be at a higher education institution. These youth need to be able to move freely, get a job, and enjoy public transit without barriers.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
E215	Rami Ibrahim	Majdal Center, SD350	<p>Lastly, we need Anti-displacement strategies: Create and fund an anti-displacement strategy to protect vulnerable communities living near transit corridors by preserving existing affordable housing, encouraging community ownership, and protecting tenant rights as well as developing new affordable housing.</p> <p>Thank you. I look forward to seeing these improvements implemented.</p>	Land use authority is reserved to local jurisdictions –the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.
E216	Randall Thill		While I appreciate the amount of effort that has gone into this proposal, I think it will not work out very well for the county. By the time the high-speed rail is completed most cars will be self driving and/or there will be cars that you can summon to your home and take you anywhere in the county for a small fee. Also, with the advent of smart cruise control more cars will be able to drive on existing freeways with less gaps between cars, which will help eliminate traffic congestion.	<p>The Regional Plan envisions a transportation system that provides sustainable mobility choices in the region. Fast and reliable transit remains the most efficient way to move the largest number of people; traffic congestion on our urban corridors will be remedied by fast commuter rail services that serve longer distance regional trips. Transit services will also be complemented by Flexible Fleets, which include shared, electric, and eventually autonomous vehicles. Flexible Fleets provide greater travel choices for connections to transit or areas where transit may not work well.</p> <p>However, there is great uncertainty about when shared fleets of fully autonomous and connected vehicles will be capable of operating in the manner you've indicated. Though small, automated pilots have been launched in many parts of the country, including San Francisco, widespread deployment of truly autonomous services is not likely until much later.</p>
E217	Randall Thill		I think the prospects for increased ridership on trains will be similar to what we have seen with the Coaster and Sprinter programs, which is minimal usage. I think part of the reason for programs like the Sprinter was to decrease air pollution but if you notice, every time the Sprinter crosses an	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The 2021 Regional Plan will add tremendous capacity to the transportation system and offer people compelling alternatives to driving

			intersection there are many cars sitting there idling until the Sprinter passes. Has anyone done an analysis as to whether this creates more or less air pollution?	alone. Infrastructure improvements at congested crossings are considered when designing and improving such intersections. The model tool that is used to measure GHG emissions and delay for the 2021 Regional Plan does include delay times at rail crossings.
E218	Ravi Gopinathan	SanDiego350	<p>First, I'd like to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft.</p> <p>However, we at San Diego 350 feel this plan still prioritizes private cars more than we need to be doing in order meet the urgency of the climate crisis through improving public transit. Instead of further freeway expansions, I support expanding our trolley network such as by building the purple line trolley from Chula Vista to Sorrento valley east of the existing blue line, and increasing density of housing along transit corridors.</p> <p>We ask that you move faster in meeting targets for emissions reduction, and improving the hours and frequency of transit so that our public transit system can be a meaningful alternative to cars. Lastly, I would like the agency to prioritize reducing car dependence, increasing walkability and housing construction nearby the Grand Central station planned to connect to the airport as well as to Escondido.</p>	SANDAG shares the goals cited in this comment. All of the projects developed in the Regional Plan are intended to provide multimodal options that will help to reduce greenhouse gases and vehicle miles traveled.
E219	Rebecca Paule	n/a	Always using MTS bus going to Samahan Clinic, waiting time is fair enough.	Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E220	Regina Agarma	n/a	To reduce health risk, what's possibility of providing electric bus. Consider offering a free fare to seniors or 65 plus with low income and underserved communities.	The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. E221	Richard Bentley	N/A	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E222	Rita Clement		<p>I live in Chula Vista. Thank you to the SANDAG staff for researching and designing the Regional Transportation Plan.</p> <p>No cost transit passes are an essential element to ensure the future success of the Regional Transportation Plan. People ages 24 and under are more likely to use transit to attend school, colleges and universities. They are the most likely to work in low paying jobs making \$15 an hour or less. If transit has no cost for them, they will probably not buy a car which pollutes the atmosphere. If they are used to taking transit, they will continue to use transit after age 24. Please support no cost transit for people age 24 and younger.</p>	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.

			took me 1 hour to go to the H ST trolley station from my home in Eastlake in Chula Vista. I used transit for 12 years.	<p>Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>In addition to increased bus frequency, as part of the 5 Big Moves SANDAG is working to implement Flexible Fleets that would offer additional mobility options for community members to get to and from transit stations. These mobility options would include electric scooters and bikes, rideshare, and microtransit shuttle systems.</p>
E224	Rob Fox		I'd like to know who the point of contact is regarding the proposed tax on miles driven by hard working San Diegans. I represent a group that is adamantly opposed to this proposal and would like to know who we can deliver petitions to and who the members of my group can contact so that they may make known their objections as well.	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues.
E225	Robert Gonzalez	N/A	<p>If SANDAG tries to implement the mileage Tax, I will sue SANDAG and keep you in court for years, seek an injunction preventing you from collecting and ensure that all drivers in San Diego are protected.</p> <p>Stop trying to charge motorists for everything we already paid for, implement what we paid for, and go after all those bicyclist that haven't paid for ANY of the roads or trails they use.</p> <p>It is unfair of you to try to charge only a motorist, yet Bicycles require special lane adaptations, maintenance and additional road upgrades that are not recovered.</p> <p>Your making improvements to roads to accommodate these individuals and charging motorists for those "improvements", which take away lanes, increase traffic, pollution and make our roads more dangerous.</p> <p>Until you tax bicyclists, any additional taxes you impose on motorists are nothing more than taxation without merit. Our roads and maintenance were already included in existing taxes.</p> <p>This is yet another reason that SANDAG needs to be closed down. Your nothing more than a waste of tax payer dollars and overhead. All of your proposals for regional transit, transportation and infrastructure upgrades have built in addition taxes and costs that benefit SANDAG and your programs directly.</p> <p>Your employee benefits and costs are absurd and the overhead for SANDAG is unnecessary, given that your Director's vision for San Diego is absurd, and San Diego needs to run him out of town just like they did in LA.</p> <p>You people are self-serving idiots. None of your proposals represent the ideas nor desires of the people of San Diego. I sincerely think that the Citizens of San Diego need to vote to close SANDAG down, just as the agency you replaced was closed down.</p> <p>Your never going to get anyone in San Diego to approve your tax increases. People already pay way too much for practically nothing. Your recognizing a cost savings that isn't passed on to the tax payer for several of your programs, and using that savings for overhead purposes. In other areas, your way over budget, late on delivery and in some projects, your years away from even getting started. In most cases, you already spent the money, and now you want more.</p> <p>Your expanding the trolley to north county, but in the mean time, who is going to rise the trolley? More homeless? That's going to go over well with people in North County, I am sure. You were supposed to buy newer updated Trolley cars, yet frequent breakdowns on these older cars are still allowed to continue. Homeless have invaded the trolley and it's generally unsafe to ride at most hours. Even if you consider it safe, transit police are mentally unstable and incredibly aggressive.</p> <p>Now your replacing the compass car system, because the old system was constantly down or not working correctly. Another waste of tax payer dollars for a broken system that you and MTA are not capable of administering or operating.</p> <p>You "purchased" the toll road, and conditions on the road have become substantially worse, and it's seldom traveled road anyway. It's dangerous, unmonitored and the toll booths are constantly broken. Machine coin counters rip you off, and there is never anyone manning the booths. An incredible waste of tax payer money. You didn't buy it, you don't own anything. The tax payers own</p>	Thank you for your comments.

			<p>that road.                      SANDAG is property of the citizens of San Diego. Your administration clearly seems to dismiss and forget that. Your not actually a real agency, you were created from the old center city development corporation and your a waste of tax payer dollars.                      It's unfortunate that more people don't care or get involved. Nobody should have to write an email to an organization that's just going to toss it in the trash. I have been to your closed door meetings and heard what you have said about the public and how you and the public safety committee really feel about public input. It's just too bad that I didn't have hidden video of such conversations at the time.                      We both know what you guys say about the public and what you will say about this email behind closed doors. Your Executive Directors office isn't private and neither are his conversations. Maybe someday, those will get exposed and the public will learn the truth. You never know what people inside your organization are leaking.</p>	
E226	Robert Luliucci	N/A	<p>A mobility hub in our community (So. East San Diego) preferably located at our current Orange Line Trolley station. Youth passes given to youth under 24.</p> <p>Fiber optics underground to ensure we are ready for state of the art transportation system that is in the design stage, (iOS systems/smart phones) and to more appropriately address the digital divide in our "Redlined communities".</p> <p>Covering our MTS bus stops. (Structures/bus shelters.)</p> <p>Consider 24 Hour service on the lines that are taking our residents to work.</p> <p>Focus on transforming to an all electric bus fleet in the first 2-3 years of implementation. Improve the frequency and reliability of our bus routes.</p> <p>Ensure all our streets are designed with the "Complete Streets" designs.</p> <p>Increased maintenance of the trolleys and buses proportionate to the heavy usage in our areas (Southeast area of the City of San Diego.)</p>	<p>All of the elements identified in your comment are under consideration in the Regional Plan. Fare subsidies are included in the plan and as part of implementation strategies it will be determined who will receive those subsidies. Next OS includes fiber connections throughout the region. MTS is working to provide shelters throughout the region. Any new infrastructure build would include shelters. 24 hour service is also included on several routes in the plan. Electrification is required by the State and is included in the plan. Complete Streets designs are an important component of SANDAG's planning today and will be included on projects int he future.</p>
E227	Roberto Velasco	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.                      We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E230	Roger Moyers	N/A	<p>Dear Sandag,</p> <p>I tried to submit this via your website but it would not accept it. So emailing:</p> <p>Your report is well-formatted and looks beautiful. Good thing it looks so great because from a reality point of view it smells like the landfill in Miramar. In simple words, it stinks. A waste of taxpayer money.</p> <p>Before deciding how to grab more of our hard-earned dollars and waste it on pie in the sky dreams of getting people to change their transportation habits you should examine what is working today and what has failed. Start first by looking at how MTS resources are used now. Huge sums of money were wasted putting express bus lines in along the I-15 corridor. So the very citizens whose tax dollars were used to build these unused bus lanes go zero value from this wasted money. Examine the most used bus lines in the MTS, they go from the US border to urban or industrial areas in the county. Yet your study wants to waste more money putting in bus lanes and more busses. Busses that nobody rides. I'd advise Sandag members to get out and ride the busses. Find out for yourselves that nobody, yes nobody, rides these things.</p>	Thank you for your comments
E231	Roger Moyers	N/A	A better use of money would be to offer anyone that wants to use a bus an Uber or taxi ride to where they want to go. All that wasted gas/energy plus a bus driver's salary to move around 1 person is a total waste. Yet you use climate change as the driver in your decisions. Either you are lying or you are ignoring the data.	The 2021 Regional Plan proposes a variety of transit services based on trip demand between major origins and destinations. For areas of less demand, services like Uber or taxi could offer an on-demand accessible mobility option.
E232	Roger Moyers	N/A	It is incredibly ironic how you throw out the word Smart in your beautiful document. When Smart is the farthest thing from what you will create. If the city can't even own up to the fact that the MTS wastes billions of dollars every year how can you honestly say that you are capable of carrying out such lofty goals as Smart Infrastructure, Smart Corridors, Smart Borders or Smart Mobility. Get the data from MTS. Show us that you are going to use our money wisely and not throw it away trying to get people to change their transportation methods. It won't happen.	The term "Smart" refers to technology solutions that will allow transportation operators to manage roads and transportation services so they operate smoothly and serve people better. The 2021 Regional Plan proposes technology solutions that will reduce traffic congestion, make public transit faster and more frequent, and provide people with better tools for trip planning.
E233	Roger Moyers	N/A	It appears your goal is to tax our citizens to death, drive up the cost of fuel and driving and expect these overtaxed, over charged individuals to toe the line you have put forth. California is already losing residents faster than any other state in the nation. Your new plan will continue this trend as you drive jobs and workers out of our state. Do you want to responsible for this continued downturn of great state. It's continue government overreach with no oversight that is killing this state. Your refusal to examine the actual data from your the implementation of your past transportation plans. Get out ride the trolley, ride the busses, drive our freeways during high use times. Admit that you cannot change the habits of people with your plan to overtax, over charge them for their preferred methods of transportation.	Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently fund different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge, including potential policies, fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure a fair system. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
E234	Roger Moyers	N/A	By the way, your statement that the seas are going to rise 2.5 feet by 2050 is so far off track. I will personally bet any one of you your annual salary that this prediction is so far from reality. If this were true then the seas should have already risen 3 inches. Of course they haven't.	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT.</p> <p>The 2021 Regional Plan is founded on the best available science and data as of the date written.</p>
E235	Roger Moyers	N/A	While prior to Covid the trend was for young families to move to high-density cities, which has been the goal of transportation agencies in California, and eliminate suburbs. But that trend has been reversed with Covid as people realize that the ability to avoid a highly communicable disease is	The 2021 Regional Plan was developed through a data driven planning process. The forecasted development pattern for the 2021 Regional Plan Sustainable Communities Strategy (SCS) is driven by regional goals for sustainability, mobility, housing affordability,

## Draft 2021 Regional Plan Responses to Comments – Email Sourced

ID	Commentor Name	Agency	Comment	Response
			much more likely in suburbs. Unfortunately lawmakers in our state continue to see the suburbs as a racist divide that does not meet their mandated “equity” solution. Once again the SANDAG members ignore that data that shows that suburbs are the most racially diverse areas of our county. It just continues the mismatch between government bureaucracies and the reality of how people live their lives in our county. Instead, it uses misguided state mandates such as those mentioned in your document to drive our transportation solutions. Stand up and let these Sacramento state government people know that they don’t understand the San Diego population and that we will find solutions that actually help our citizens. Empty busses, empty trolleys, do nothing to help our community.	and economic prosperity. The SCS land use pattern uses areas in the region known as Mobility Hubs to concentrate future development. Mobility Hubs are communities with a high concentration of people, destinations, and travel choices. The SCS land use pattern represents a continuing trend in the San Diego region to provide more housing and job opportunities in the existing urbanized areas of the region.
E236	Roger Moyers	N/A	<p>There are commercial companies that can and already do manage transportation so much more efficiently than any government entity will ever be able to. Why is this true, because they operate their businesses efficiently. Efficiency is the bane of solutions put forth by government agencies. In your own words in your own document, it’s all about equity. But how is it equitable when the solution overburdens certain parts of the county with high taxes yet punishes those very citizens with solutions that they won’t use. Trying to take solutions that work well in one area and foist them on other areas will never work. To make matters worse the attempt by your taxation policies to force people into further poverty so they become dependent on your proposals is not the role of government agencies.</p> <p>Get out your office, ride the busses, ride the trolleys. This plan does not meet the needs of the people of San Diego, it meets the needs of the politicians that occupy our state government. Be strong, stand up. We need solutions that work, not put more people in poverty and drive them out of our state.</p>	A critical component of reviewing the impacts of the 2021 Regional Plan is evaluating the effects on historically underserved and systemically marginalized groups. This evaluation is known as a social equity analysis and focuses on communities of color, residents with low incomes, and seniors. While the 2021 Regional Plan delivers improvements to the entire region, this review ensures that the benefits are shared by everyone and that the burdens of the 2021 Regional Plan’s changes are not disproportionately shouldered by any social equity focus population.
E237	Roxana Morris	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn’t move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E238	Ryan McCarty	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn’t move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need. We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>Before I got my drivers license a few years ago, I relied entirely on public transit and got pretty good at navigating the routes. I would feel more encouraged to use it if there were more routes available but it be buses or trolley routes. I still use one of the trolley routes to get into downtown for easier parking at another station, yet a major bus terminal requires a parking permit since it is in Miramar College.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E239	Ryan Okeefe	N/A	ABSOLUTELY NOT!!!!	Thank you for your comment.

## Draft 2021 Regional Plan Responses to Comments – Email Sourced

ID	Commentor Name	Agency	Comment	Response
E240	Sadie Sullivan-Greiner		<p>How do you do? I have read the plan, and have a few thoughts. I was not able to find supporting appendices, so some of these questions may have been answered, and if so, I apologize. I will organize my comments by page number, from the downloadable version. I hope they will be of some value.</p> <p>Pg 6:                      “Transit Leap”: In getting people from where they live to where they want to go, work is doubtless the most significant destination. In my own area, there are a lot of people who must commute to Sorrento Valley &amp; North County. There is no good way to do that by transit. What kind of data gathering has SANDAG done to identify and quantify the numbers, locations, and necessary timing to get 80% of those people to and from work in under an hour on a daily basis?                      Additionally, I would suggest that the following be regarded as primary destinations: the neighborhood ‘downtown’ area, the regional courthouses, the DMV offices, universities &amp; colleges, hospitals, grocery stores, and retail areas.</p>	<p>SANDAG developed the Regional Plan and the proposed transportation network based on a data-driven process— analyzing where people live and work, how they get around, what transportation infrastructure exists, what is needed to serve future growth, and more. This data included census data and cellphone based data. SANDAG did not build it on data alone: The Regional Plan reflects the views of real residents from around the region, the professional judgments of a number of planning professionals at the agency, and extensive knowledge of diverse communities across our region. Appendix T includes the detailed methodology for network development and performance of the plan related to improved access to basic needs (retail, parks, and medical), employment centers, and higher education.</p>
E241	Sadie Sullivan-Greiner		<p>Pg 19:                      “Sustainable Communities Strategy”: Accommodating the Regional Housing Needs Assessment Determination. While we are still in the throes of a pandemic, it will end. When it does end, there is likely to be a surge in homelessness, as people are evicted from rentals. It seems to me that SANDAG could prepare the cities and county for that surge by getting a cooperative group going that would pre-plan for emergency shelter for those who will need it, with the understanding that such shelter needs to have access to sanitary facilities, access to medical care, and assistance for ensuring that affected children remain in school, and that parents who require child care to work or look for new jobs can find that child care. Additional needed services need to be accessible on site.</p>	<p>Indeed, it is hoped that the pandemic will end, and we know that the housing crisis will get worse. There are a number of federal, state, and local initiatives to support affordable housing and wraparound services. SANDAG’s role is to support the jurisdictions in the development of affordable housing throughout the region. We are in the process of administering a new state grant program to support access to affordable housing.</p> <p>For more details please review: Appendix K - The Regional Housing Needs Assessment Plan.</p>
E242	Sadie Sullivan-Greiner		<p>Pg 21:                      “Complete Corridors...give buses and other transit vehicles dedicated space on roadways that is uncongested by cars and trucks.” (Just visualize the old lady doing the happy dance! I’ve been wanting that for years.)                      “Safe and convenient places to park....” Yes. These could also be used as safe overnight parking for those who are forced to live in their cars. Jewish Family Services runs a similar program here in San Diego; their experience could be useful in expanding the concept.                      Not incidentally, consider safe and convenient places to park one’s bike! Very few places have bike racks that can be used to put a lock on while one is in a shop or at an appointment, most places aren’t happy having bikes wheeled into their premises, and yet finishing one’s business &amp; discovering that one’s bike has been stolen doesn’t inspire confidence in the bike as a reliable mode of transport.</p>	<p>Initially adopted in 2010, the Regional Bike Network includes regionally significant active transportation facilities implemented through multifaceted street retrofits including bikeway, walking, drainage, lighting, signal, transit, and landscaping improvements.</p> <p>Regarding bike parking, we work to include visible and convenient bike parking in every one of our active transportation and transit stations projects. That said, SANDAG-led active transportation projects are limited to the regional bike network (see paragraph above) or transit network. For local discussions with individual cities, we recommend working with city staff. We are happy to help connect you to the right people if we can, although we do not have control over the process of local jurisdictions. Not to say there haven’t been successes, for example, we at SANDAG have provided grant funding for the City of Oceanside to set up a secure bike parking area near their City Hall. We will continue to work with local agency jurisdictions through our Smart Growth and Active Transportation Grant programs to increase the number of secure parking areas for bikes and personal micromobility devices. Thank you for your comments.</p>
E243	Sadie Sullivan-Greiner		<p>Pg 24:                      “2050 Transit Network (map)” I see Downtown and San Ysidro Mobility Hubs...but none for East or North County. As you know, East County is not, generally, a high income area; functional transit would be a great boon, economically and otherwise. North County is developing a high-tech jobs base, which needs workers, and one only needs to think of the traffic on I5 or I805 during rush hour...</p>	<p>The 2021 Regional Plan includes Mobility Hubs and Transit Leap services for East County and North County. These projects can be found in Appendix A: Transportation Projects, Programs, and Phasing. Mobility Hubs are communities with a high concentration of people, destinations, and travel choices. They offer on-demand travel options and supporting infrastructure to enhance connections to high-quality Transit Leap services while helping people make short trips around the community on Flexible Fleets.</p>
E244	Sadie Sullivan-Greiner		<p>Pg 25:                      “Better Integration...” An anecdote for you: My niece had a 0800 doctor’s appointment in La Jolla; she lives in Lakeside. She called me in tears to beg a ride because there was no way she could get to the appointment by transit. It was literally not possible.</p>	<p>SANDAG agrees that our region needs to provide fast, frequent, reliable, and accessible transit.</p> <p>In addition to the transit projects proposed in the 2021 Regional Plan, SANDAG will be conducting pilot programs for the implementation of Flexible Fleets and other micro-mobility options to help connect people in less dense regions into the greater transit network. Information regarding Flexible Fleets can be found in Appendix A and N. Addition materials can be found at:  <a href="https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdfrpvisionfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f865_2">https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdfrpvisionfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f865_2</a>.</p>

## Draft 2021 Regional Plan Responses to Comments – Email Sourced

ID	Commentor Name	Agency	Comment	Response
E245	Sadie Sullivan-Greiner		Pg 26: “Safe Streets...wider walkways...” I’m sure you have engineers who can give you a measurement, but (roughly) if people can’t walk two abreast, they won’t walk. That’s bad for traffic, and for public health.	SANDAG follows national and international best practices in bikeway design to create safe facilities for users of all ages and abilities, which includes recommended path widths for estimated users by mode. That said, our plan is a plan for the whole region, and our efforts are regional. For local discussions with individual cities regarding existing infrastructure, we recommend working with city staff. We are happy to help connect you to the right people if we can, although we do not have control over the process of local jurisdictions.
E246	Sadie Sullivan-Greiner		Pg 32: “San Diego Region in 2050” chart” Your chart shows 16% of new jobs outside of mobility hubs. The goal must be to have the increase in transit and the increase in housing, match the locations of the increase in jobs. If we don’t achieve that, we’re just replicating the current issues. If it isn’t possible to increase housing in an area, then transit options must be increased to connect the available housing with the locations of jobs.	The proposed land use pattern of the 2021 Regional Plan focused jobs and housing primarily in existing communities and near transit. Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG will work closely with local jurisdictions to implement the land use pattern proposed in the 2021 Regional Plan.
E247	Sadie Sullivan-Greiner		Pg 33: “Regionally, government agencies are considering how to better align housing policies with transportation initiatives.” Forgive me, but haven’t we seen this material before? We require developers to provide minimum parking spaces for their buildings. We can require them to work with transit authorities to plan for bike lanes, wider sidewalks, bus stops, and transit centers, while requiring the transit authorities to cooperate in planning for the construction of those things.	The 6th Cycle Regional Housing Needs Assessment (RHNA) Plan sets a strategy for sustainability that focuses housing and job growth in urban areas where there is existing and planned transportation infrastructure, protects the environment and helps ensure the success of smart growth land use policies by preserving sensitive habitat and open space, and addresses the housing needs of all economic segments of the population. In the long term, housing located near transit and jobs should provide opportunities for residents to take more trips by bus or train and live closer to where they work, reducing vehicle miles traveled (VMT) and greenhouse gas emissions.
E248	Sadie Sullivan-Greiner		Pg 34: Figure 2.7: “Sea-Level Rise”... Put this on a detail map, and make it available on your website. People will understand what 2.5 feet by 2050 means better if they see the tide line coming over the street they live on.	SANDAG has prepared a Regional Transportation Infrastructure Sea Level Rise Assessment and Adaptation Guidance in May 2020. This project analyzes potential sea level rise impacts to transportation facilities such as highways, bikeways, trails, and light and heavy rail that cross jurisdictional lines and includes maps that show the impact of sea level rise on the San Diego region. The Adaptation Guidance was recommended by the SANDAG Regional Planning Committee and accepted by the SANDAG Board of Directors as a regional resource. The document is available on SANDAG’s website at: <a href="https://www.sandag.org/uploads/projectid/projectid_510_28075.pdf">https://www.sandag.org/uploads/projectid/projectid_510_28075.pdf</a> .
E249	Sadie Sullivan-Greiner		Pg 35: “...local CAP implementation through regional initiatives, such as carbon sequestration.” How? And where? Every one of those plans I’ve seen calls for a specific geology, and I don’t recall seeing it in our region. We’ll have better chance at carbon sequestration by planting trees down the greenway of every street, and requiring all new construction to produce 50% of its anticipated power needs via on-site solar or wind.	The 2021 Regional Plan proposes a Nature-Based Climate Solutions Program that will promote natural infrastructure that uses or mimics natural processes to benefit people and wildlife. SANDAG will prioritize resilience and innovative solutions in transportation infrastructure, Comprehensive Multimodal Corridor Plans, and consistent regional planning and implementation of the Sustainable Communities Strategy actions, emphasizing both nature-based and technological climate solutions. There are also further opportunities to expand upon ongoing efforts to assess the amount of carbon storage and sequestration potential of open space lands and the co-benefits from preserved open space, land management, and restoration activities.
E250	Sadie Sullivan-Greiner		Pg 41: “...mobility hubs to Tier 1 employment centers...” What is the definition of “Tier 1” employment?	SANDAG defines “Tier 1 employment centers” as those communities with the highest densities of employment in the San Diego region. Three employment centers comprise the Tier 1 category – Sorrento Valley, Kearny Mesa, and Downtown San Diego. These are the communities with more than 75,000 employees. More information and analysis on these and other employment centers in the region is available at: <a href="http://www.sandag.org/employmentcenters">www.sandag.org/employmentcenters</a> .
E251	Sadie Sullivan-Greiner		Pg 47: “Road User Charges” Unless you want to try and institute a county-level gasoline tax, how are you planning to track and calculate this? I can hear the outraged screams now. Any sort of tracking is going to fuel paranoia over ‘government interference’.	We understand there are concerns around the privacy and implementation of a road usage charge. Significant additional work, including public involvement, pilot testing, legislation and much more will be necessary to inform implementation of elements of this plan, including the road usage charge. At a minimum this plan is updated every four years with the latest in planning ideas and concepts. Further research will, and is currently, being conducted at the regional, state, and federal level on how to effectively implement these new funding options while safeguarding the public’s privacy.  SANDAG will launch a study in the next year to further study the potential of usage-based

				<p>fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.</p>
E252	Sadie Sullivan-Greiner		Pg 49: “Flexible Fleets will be primarily accessible through mobile apps ....” The issue I see here is that not everyone has a smartphone. This might be a place where the old pay-phone model could be useful: An access point into the system placed at bus stops or train stations, accepting debit cards or coins.	Ensuring there are options for all people to access Flexible Fleets is an important component of the 2021 Regional Plan. This includes designing services that enable all people to easily reserve a ride such as a call center, cash payment options, or trip planning kiosks in mobility hubs. As Flexible Fleet pilots are launched in the region, services will be designed to be inclusive and equitable for all.
E253	Sadie Sullivan-Greiner		Pg 51: IRT Military Working Group: We’re retired Navy. Cut a deal with the Navy to run buses from each housing area to the bases & you’ll cut a lot of traffic. Move from there to other parts of the plan	SANDAG is actively working with our partners, including the military, to plan and test new mobility services that improve transportation for commuters. This includes providing new transit and Flexible Fleets options such as e-bikes, shuttles, or ridesharing that can provide a convenient alternative to driving. SANDAG will continue to work closely with stakeholders to explore innovative solutions to improve mobility options.
E254	Saed Hagi	N/A	When will they start developing the grand central station and where? What’s the expectancy time or projection of The Big Five moves to completed? Are we really having faster rail than the current trolley we use in the future?	<p>Preliminary environmental work is on the Central Mobility Hub is currently underway. Information about this project can be found on: <a href="https://sandag.mysocialpinpoint.com/centralmobilityhub">https://sandag.mysocialpinpoint.com/centralmobilityhub</a>.</p> <p>The Central Mobility Hub will be designed to accommodate both existing Bus, Trolley, COASTER trains, and Pacific Surfliner trains as well as new higher-speed commuter rail services envisioned in the 2021 Regional Plan.</p>
E255	Salvador Bernal	SanDiego350	In a rich country, the rich take public transport. Prioritize public transport.	The 2021 Regional Plan seeks to offer fast, safe and reliable transportation options for the San Diego region that make public transit a competitive alternative to personal vehicles.
E256	Samar Alyas	El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative**</b></p> <p>We are so thankful for these lovely projects up coming to our state. #1 As a parent for a high school student I would like this project to find a way to make it easy for high schoolers to get to the schools because they are away more than 3 miles. #2 We would like to support the idea to make it affordable to students who are less than 25 years so they could get to school ASAP.</p>	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
E257	Sandra Buehner	N/A	Until you can lower the cost of housing in San Diego County, this gas tax per mile hits those who can least afford it. People who live in Tijuana and those who live in Temecula and each work in various locations throughout San Diego County.	The 2021 Regional Plan is a long-range planning document and is required by federal law to provide a reasonably feasible funding plan. Significant additional work, including public involvement, pilot testing, legislation and much more will be necessary to inform implementation of elements of this plan. At a minimum, this plan is updated every four years with the latest in planning ideas and concepts. There will be two additional regional plans developed prior to the 2030 planned timing of the roadway usage fee.
E258	Sandra Candler	Cajon Valley Union School District/El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>After viewing the Draft 2021 Regional Plan at the El Cajon Collaborative meeting on 7/6/21, I was amazed at how well thought out the plan seems to be. I appreciate the city listening to the</p>	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .

			community and taking their comments in consideration of what is being prepared for the future. As a school district employee and working with the families that will really benefit from a centralized hub, it opens possibilities for opportunities in learning, training, and employment for needy and low-income families. It is exciting to see this work moving forward.	
E259	Sebastian Frias	SanDiego350	<p>First of all, I want to thank the staff at SANDAG for taking seriously our climate emergency and addressing it in this Regional Transportation Plan draft.</p> <p>However, I believe because of the urgency of the issue we must speed up some of those goals. We have an ecosystem and some members of our city who do not have all that time to linger without progress.</p> <p>I want to ask specifically that you reduce your Green House Gases output more than the proposed 40%. There are estimates that put San Diego's transportation at half of it's emissions, that with the airport in Downtown and with the overwhelming majority of people driving to work makes some of the air in San Diego very unhealthy. I request that you up your reduction and speed up the process for this decrease.</p> <p>When I was in college, I got to travel to Madrid to study abroad. I did not have the means to buy a car, and to get to the university I had to take the metro and then a train. This college experience would have been slightly different had there not been such a good public transportation system, and a 20 euros monthly passes for people under 25 years of age. Talking to the international students in San Diego, many feel like their only alternative is to rent a car or use rideshare apps, both which dramatically increase their study abroad costs. Not only for that small portion of the population would it be important, but for our local students, the thousands of them like my sister who use the bus at Liberty Station to go to High School from Chula Vista. This and to increase the frequency and times for transportation would be a great benefit to our beautiful city of San Diego.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E260	Sheri and Art Armendariz		<p>Thank you for the wonderful emails and communication of goals. However, the huge website is time consuming for average citizens to search. A better search feature is needed from our mobile phones.</p> <p>There is no need for an expensive walkover/ bike over bridge in Encinitas, proposed to connect the Union Streets over I-5.</p> <p>There are two already within a mile. One at Encinitas Blvd. and one at Leucadia Blvd.</p> <p>Our small Union Street already has an apt. complex coming and the amount of traffic will be dangerous to bikes and pedestrians.</p>	<p>We have worked with our project partners at Caltrans to include the North Coast Bike Trail projects in our Final 2021 Regional Transportation Plan as part of the Adopted Regional Bike Network. Caltrans will be the implementing agency working along with the individual jurisdictions to complete their segments of North Coast Bike Trail as per the NCC PWP/TREP, which includes the Union Street connection.</p> <p>Your comment was forwarded to Caltrans.</p>
E261	Sophia Waker	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>Making these changes will increase the amount of people on public transit systems!</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. 			hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.	<p>looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E263	Stephanie	N/A	Patients at Samahan Health center in Granger location were affected by the removal of the bus stop at Granger. The next bus stop is not until 1 mile down from the clinic. Patients at Samahan are mostly elderly and is not very convenient to have a bus stop so far away from their pcp's office.	MTS is responsible for the placement of local bus stops. We have forwarded your comment to them.
E264	STEVEN GELB	N/A	<p>Every day the news brings us more evidence of looming ecological collapse.</p> <p>This morning it is the deterioration of the Gulf Stream which will have devastating effects on civilization world wide as it progresses. SANDAG must revise the RTP to prioritize transit infrastructure now, rather than committing to road projects.</p> <p>I take transit as much as I can to avoid contributing to global warming in my car. But I've had to use my car when I'd prefer not to because the system is so limited and slow. For example, I had a weekly meeting that ended at 9:00pm in Rancho Penasquitos. The number 20 bus I would have taken to come home did not run that late, so I had to drive.</p> <p>Please create a quality transit system in San Diego as quickly as possible.</p>	The Regional Plan includes a variety of new transit options that will make transit a more optimal choice for many riders.
E265	Steven Koch	MTGL, Inc. - Senior Vice President	My company provides a daily service needed for construction. Testing & Inspection services are included with the general contractors bid however we are a non-union firm which excludes us from working on most projects. Is there an effort for SANDAG to sponsor a Project Labor Agreement that would allow non-union firms to work with union signatory contractors for up and coming projects? MTGL testing labs is a certified DBE and Caltrans certified firm.	<p>On July 23, 2021, the SANDAG Board authorized SANDAG staff to begin negotiations with the San Diego County Construction Trades Council to execute a Community Benefits Agreement or Project Labor Agreement. However, California Labor Code Section 2500 (2) with regards to Project Labor Agreements, permits all qualified contractors and subcontractors to bid for and be awarded work on the project without regard of whether they are otherwise parties to collective bargaining agreements. Please note, that the Board has only authorized negotiations of a Project Labor Agreement and has not yet approved it. For more information regarding the Community Benefits Agreement and the Board of Directors, please see: <a href="https://www.sandag.org/index.asp?fuseaction=meetings.calendar">https://www.sandag.org/index.asp?fuseaction=meetings.calendar</a>.</p>
E266	Susan delos. Santos	N/A	How do I avail of the bus schedule?	The 2021 Regional Plan includes increased service spans for the trolley and bus service up to twenty hours per day. The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24 hours.
E267	Susan Duerksen	SanDiego350	<p>Thank you for doing better, but we are out of time. By still putting highways first, the draft Regional Transportation Plan doesn't match the urgency of the climate crisis.</p> <p>We need reliable, accessible public transit now! That means 24-hour service and 10-minute frequency, at least on major bus and trolley routes.</p> <p>We have to get out of our cars. San Diego sorely needs decent public transit. Stop wasting time, please.</p>	<p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on</p>

				planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E268	Susan Pedersen	N/A	<p>SANDAG officials , San Diegans are Not in favor Of this tax ! it's is Not acceptable .</p> <p>If you persist in trying to add this to</p> <p>Over burdened tax payers .</p> <p>We will see if we can remove this board</p> <p>from our County .</p> <p>Time to Stop this unlawful burden to working People of San Diego .☹️</p>	Thank you for your comments.
E269	Susan Wilding	N/A	<p>I would like to know what are the specific community plans for the Pacific Beach and Mission Beach communities. I see you have slated bus-lines every 10 minutes, and a Last Mile Delivery and Ride Hauling services. It appears that you have quite a number of vehicles on the road, and none of them as actual community members. Additionally, I would like to see what you have slated for housing and parking.</p> <p>Also, can you mail me a copy of your plan to read.</p>	<p>The Regional Plan outlines the following projects in the Pacific Beach/Mission Beach areas. These proposed projects can be viewed in more detail using the data viewer on <a href="https://sdforward.com/envision">SDForward.com/envision</a>.</p> <p>Pacific Beach Mobility Hub Complete Corridor Arterial improvements on Ingraham Street, Mission Boulevard, and Grand Avenue. On-street and off-street bike and pedestrian facilities from Pacific Beach to East Mission Bay. On-street bike and pedestrian facilities on from Mission Boulevard to Pacific Beach Drive. <i>Rapid 292</i> – Pacific Beach to Kearny Mesa via Balboa Avenue to Grand Avenue. On-street bike facilities from Pacific Beach to Mission Beach via Cass Street. Next Gen <i>Rapid</i> service on Route 30 to the Balboa Station.</p> <p>Specific community plans and decisions regarding land use will remain under the authority of local jurisdictions and will require future collaboration with community members and the City of San Diego.</p> <p>A SANDAG staff member will be in contact with you regarding how to obtain a printed copy of the requested documentation. The full draft 2021 Regional Plan can be viewed on our website at: <a href="https://www.sdforward.com/mobility-planning/2021-regional-plan-draft">https://www.sdforward.com/mobility-planning/2021-regional-plan-draft</a>.</p>
E270	susana arnold	N/A	As a North County resident, I support the 2021 Regional Transportation Plan. It is important to me that we reduce greenhouse emissions for a cleaner environment and provide clean rapid transit for people of all ages connecting ALL of San Diego. I support timely rapid transportation for all San Diego County community members who support San Diego's business community.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://sdforward.com">SDForward.com</a> .
E271	Tarik Abdennabi	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>I also think that the growth of public transit is necessary for any legitimate city to grow as a city. Southern California is severely lacking in that department when compared any big city in the U.S..</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E272	Theresa Lane	Sunrise Movement	<p>I'm a volunteer with the Sunrise Movement.</p> <p>Every San Diegan deserves access to high-quality transportation and economic mobility, especially young people ages 24 and under and seniors.</p>	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway,

			<p>We urge SANDAG to amend Appendix A of the 2021 Regional Plan to declare that no-cost transit passes for youth ages 24 and under receive priority when Transit Fare Subsidies are allocated.</p> <p>Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. No-cost transit passes is a key investment necessary for our region's equitable economic recovery.</p> <p>No-cost transit passes for all youth ages 24 and under ensures generations of lifelong transit riders are part of our long-term strategy to build a greener and equitable San Diego.</p> <p>No-cost transit passes will connect youth to school, work, medical care, internships, and other early-career opportunities.</p> <p>Programs like these exist with great success in Alameda County, Boston, San Francisco, and most recently Sacramento and Los Angeles.</p> <p>I urge the board to take bold action to build a greener, healthier, prosperous, and just future in San Diego. Please amend the Plan to include Youth Opportunity passes as a priority.</p>	<p>staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E273	Tiffany Maple	N/A	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>As a native San Diegan and East county resident, I've had to drive everywhere as public transit hasn't been a relief or accessible option. That contributes to traffic and pollution as I would love the option of a better designed transit system.</p> <p>I ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. I so ask that you make it very affordable so low income communities can use it.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E274	Tina Tran	SanDiego350	<p>Hello, I am with SanDiego350. First, I want to thank the staff at SANDAG for their efforts in addressing climate and equity in this draft for the Regional Transportation plan. However, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>I want to ask you to move faster to accelerate greenhouse gas emission reduction goals. As a youth, I fear for my future on this planet because of climate change, and I live not far from those wildfires every year.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
E275	Tom Abram	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. There are still many barriers to expand the amount of people taking public transit on a regular basis. We need to make it more convenient and affordable for all people to take benefit of transit.</p> <p>The climate crisis is already here and affecting us. We have to take a leadership position to reduce our own regional emissions and serve as a model for others.</p>	<p>SANDAG recognizes the urgent need for reduction of GHG emissions, especially in our most marginalized communities, as a key aspect in an equitable and sustainable future for the region. Please see Attachment 3 of Appendix H: Social Equity: Engagement and Analysis, where you will find a list of transportation projects aimed to reduce pollution exposure in our region's disadvantaged communities in accordance with AB805 and CalEnviroScreen 3.0. More detail on phasing and funding allocations to these projects can be found in Appendix B: Implementation Actions.</p> <p>Additionally, one of the near-term Implementation Actions listed in Appendix B will be a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, students, and youth. SANDAG</p>

			<p>While managing the sustainability efforts at SDSU, I encouraged students, faculty, and staff to take transit. Even with an incredible transit station on campus, only a small portion of the community took transit to campus. Barriers included frequency and cost, especially for low income students. I'd encourage you to work with SDSU and other large campuses and organizations to develop universal transit passes. We also need programs to normalize and get people comfortable with transit. A lot of hesitancy was from people who never took transit in their lives.</p> <p>I encourage you to emphasize transit rather than single-occupancy vehicles to reduce our emissions and address equity issues here in San Diego.</p>	<p>also is currently working with the Social Equity Working Group to develop near-term solutions to address transit service improvements, amenities, and subsidized transit fares.</p> <p>In Appendix U: Cost Estimation Methodology, Table U.2 captures the transit fare subsidies to riders throughout FY2026-FY2050. For more information on the Value Pricing and User Fee Implementation and the Regional Fare Impact Study, please see Appendices B and U.</p> <p>Lastly, another near-term action of the Regional Plan includes developing a Digital Equity Strategy and Action Plan that will address regional accessibility gaps in communications infrastructure, technology, and digital literacy. Through this, SANDAG aims to provide accessible, educational resources on transit are readily available as we advance with our next OS system. More information on the Digital Equity Strategy and Action Plan can also be found in Appendix B.</p>
E276	Tony Ramirez		<p>I looked through your website and its very difficult; next to impossible, to locate where to leave input for the user tax being proposed. Today being the deadline, please note that I oppose the tax.</p> <p>We already pay high taxes on everything: gas, property, vehicle registration, sales, state income. etc.</p> <p>How about stop spending so much money on landscape? This area is arid; look at Nevada.</p> <p>And how about taxing bicyclist for these new bike lanes and restriping.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. While the design of the program has not yet been determined, initial assumptions included in the Regional Plan is that the regional road usage charge would be a user-fee for use of roads in San Diego County. So a San Diego County resident would not be charged a San Diego user fee for miles drive in other counties, and residents of other counties would be charged for miles driven in San Diego county. SANDAG will rely on coordination with other agencies in California along with the State Department of Transportation to integrate the selection of technology, collection methods, and account management to ensure a consistent experience for travelers.</p>
E277	Tore Hultgren		<p>It appears that SANDAG's 2021 Regional Transportation Plan suggests that public transit be expanded and that the driving and parking of cars should be made costly and difficult. Obviously, mass transit can significantly reduce traffic congestion and greenhouse gasses. It is particularly important to provide a public transportation option for commuters. Trams and buses should not only reach major employment areas but must be extended deep into residential areas with stations that provide free and sufficient car and bike parking to accommodate short distance driving from the homes of commuters.</p> <p>The cars will be with us now and in the future when they all become electric, powered by wind, solar, wave and nuclear electricity generation. Free parking will always be needed at local shopping areas, even at regional ones, because there is a limit to what you can carry by foot or bike. Also, parking will be needed at places like Costco and Home Depot where you often purchase heavy items. Likewise, the car will be needed to bring the surfboard and the picnic to the beach. My point is that free - or reasonably priced - parking, must still be provided, and there is no reason to punish the driver for trips that are difficult to make by public transit. Higher fees will not stop the drivers when they need the car.</p>	<p>The 2021 Regional Plan has redefined the transit network to include a 'support system' of regional Mobility Hubs and Flexible Fleets to expand the reach of transit to ensure major destinations are more accessible. Supportive land use combined with high quality transit service and an array of on-demand Flexible Fleets can offer a '15-minute city' experience in and around each of the regional mobility hub coverage areas featured in the Plan. Between now and 2050, it's anticipated that the drive alone mode share will be significantly reduced. Cars will still play a part in the mobility ecosystem, yet effective parking and curb management strategies will be needed as multimodal options within communities increase. The key will be to make the right amount of parking available when it is needed and price it so that alternative commutes are encouraged and accessibility, equity, and economic development are promoted. Tiered pricing will need to be implemented; for example, free and lower priced parking in outlying, more suburban communities including 'gateway' (i.e., end-of-line Transit Leap stations) compared to market-rate pricing in our urban core and other denser communities.</p>
E278	Tore Hultgren	Retired AICP Planner	<p>It appears that SANDAG's 2021 Regional Transportation Plan suggests that public transit be expanded and that the driving and parking of cars should be made costly and difficult. Obviously, mass transit can significantly reduce traffic congestion and greenhouse gasses. It is particularly important to provide a public transportation option for commuters. Trams and buses should not</p>	<p>The draft 2021 Regional Plan's network of mobility hubs includes strategies such as priced parking in commercial areas in combination with the deployment of on-demand Flexible Fleets, including services for seniors. Parking pricing is one of many travel demand management strategies communities can implement while ensuring there is adequate</p>

Higher fees will not stop the drivers when they need the car.</p>	<p>curb space for both parking and loading/unloading of passengers and goods. SANDAG intends to use emerging technologies to provide a fast, safe, and reliable transportation system to the San Diego region. Personal vehicles will continue to be part of our transportation system, but we also intend to provide competitive transportation methods to the personal vehicle. By providing alternatives to the personal vehicle, we could actually alleviate highway congestion, make our roads and streets safer, and make our whole transportation system operate more efficiently.</p>
E279	Travis Jeremiah		<p>As a member of our San Diego county community, I look forward to the promise and future we have ahead of us as a society. I understand that the Big 5 moves are a part of that, and that sounds amazing.</p> <p>However, how we fund that should be looked at more intensely. I do not believe that a mileage tax is the right thing to do.</p> <p>While a gas tax is going to become less effective as EV's gain more market share, taxing every citizen on their travel is not the answer.</p> <p>Road trips to see family out of state, camping trips, and other recreational activities that require us to get to a location to start should not be taxed.</p> <p>Taking children to and from school, the jobs that cannot telecommute, and errands like grocery shopping should not cost money just to go do.</p> <p>I understand we need to create the funds to pay for these initiatives. But forcing citizens to pay a tax on their traveled distance in a vehicle is wrong. We created a society where travel is necessary for most of it. Taxing that necessity is advantageous and cruel, especially for those already in low income jobs, that require the commute to their jobs.</p> <p>I hope that as we look to our future, we do it in a way that lets us thrive together, and not punish us for our involvement in it.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. E282	Veronica Osuna	n/a	Bus need daily maintenance.	Buses currently receive daily maintenance. As part of Covid protocols, buses are wiped and cleaned at the end of each run throughout the day.
E283	Vicky James	SanDiego350	<p>I want to thank the staff at SANDAG for their work in addressing climate and equity in this Regional Transportation Plan draft, but this plan doesn't move quickly enough to meet the URGENCY of the climate crisis, in my honest opinion.</p> <p>I BEG that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p> <p>I live in Ramona, and public transportation up here is a JOKE!! I'm pretty sure if you added more frequent busses, you might get more commuters using public transportation vs. driving up and down the hill on a daily basis.</p> <p>I realize that Ramona isn't a big priority, but it SHOULD be!!</p> <p>The number of cars going down the 67 to jobs in Poway, San Diego, El Cajon and beyond cause serious congestion EVERY weekday, but there are NO good options for those commuters.</p> <p>Adding routes, adding more busses, along with community meetings to get LOCAL input on the needs of those commuters, would go a long way toward decreasing the amount of emissions generated by the hundreds of cars that make that commute on a daily basis.</p> <p>Widening the 67 is just a stop-gap measure that makes it easier for those already commuting, but does nothing to help with the climate crisis we find ourselves facing right NOW!!</p> <p>I've lived in San Diego county since 1956, growing up in Poway and living in various parts of inland N county forever. I've seen 2 of the largest fires in the county firsthand, watched RB burn... BURN!! I was told to evacuate during that fire. Now I live in the Witch Creek area E of Ramona, an area that burned in both the 2003 and 2007 fires, and where the 2007 fire first started. Last summer the temperature at my house hit 121, a temperature I've NEVER experienced in my lifetime, nor EVER thought I'd experience HERE, at my home!!</p> <p>Climate change is happening before my eyes, at a rate BEYOND what scientists predicted, and it's not gonna get any better without BOLD action. But there ARE steps that can be taken to slow it down, if people and governments start working TOGETHER to reduce OUR impact!!</p> <p>We don't have time to wait...</p>	The San Vicente Comprehensive Multimodal Corridor Plan (CMCP) will study ways to improve transportation safety, provide emergency evacuation options, maintain rural community character, and create greater trip reliability and efficiency.
E284	Violet Mooberry	N/A	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn't move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. E286	Virginia C. Hire Damrauer, MLIS, MBA, MFA, EJD		<p>I attended the online meeting tonight (Wednesday, 30 June) for Central San Diego residents to discuss and comment on the SANDAG draft 2021 Regional Plan. I truly appreciate the ability to provide my input as a citizen of San Diego.</p> <p>I was happy to hear one of the other citizens with the screen name “RightCow LeftCoast” ask about transit plans between San Diego and Imperial Valley as one of his multiple questions. I apologize, but I did not hear clearly what the reply was about that part of the transit plan.</p> <p>In support of a regional approach to affordable housing, please consider the creation of a new East-West Transit comprehensive solution (a mix of Commuter Train, Commuter Bus, Trolley, Commuter Airplanes, anything, everything, etc.) from El Centro/Imperial Valley to Central San Diego. Please also include solutions for First, Second, and Third shift workers, and weekend workers (I work 2nd shift and some weekends).</p> <p>The rationale behind this request is that there are open jobs in San Diego and there is still plenty of affordable housing (\$1300 or less per month) in farthest East County, El Centro, and Imperial Valley. The option of reliable transportation between Imperial Valley and San Diego County can quickly and significantly reduce existing homelessness, prevent emerging homelessness in the first place, reduce housing anxiety, and will relieve some of the pressure in the San Diego housing market while encouraging workers like me to fill open jobs.</p> <p>Thank you again for this opportunity to represent San Diego workers like myself, and to voice our concerns.</p>	<p>SANDAG recognizes the need for more affordable housing for people of middle to low incomes households that are near employment centers and a variety of transportation options. SANDAG is currently developing a Regional Housing Incentive Program and will take several factors into consideration to ensure the program meets housing needs and the goals of the 2021 Regional Plan. The housing program will consider climate change, climate resilience, and consistency with the transportation improvements and land use goals included in the 2021 Regional Plan. SANDAG will also coordinate with the Social Equity Working Group and other interested stakeholders to ensure the housing program promotes equity and addresses issues like gentrification and displacement.</p> <p>SANDAG acknowledges that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights.</p>
E287	Wendy Mihalic	SanDiego350	<p>I am a proponent of TOD but its hard to convince others of its benefit when our transit system is still so lacking - even in La Mesa which has five (underutilized) trolley stations! The vision in this RTP is much appreciated but falls short to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>Please move faster in meeting targets for emissions reduction, transit projects, and the hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars. We are facing a climate emergency. Our actions need to reflect that.</p>	The 2021 Regional Plan meets the region’s required greenhouse gas emission reduction target by 2035 through a combination of both land use and transportation strategies that allow for a meaningful alternative to cars for more trips. The Plan includes investments in both the existing public transit system to improve hours and frequencies of service as well as new Rapid bus, light rail, and commuter rail services.
E288	William Wellhouse	SanDiego350	<p>Thank you for all of the work you have put in to this new transportation plan. I strongly support your efforts to address climate change and climate justice but I would ask that you move more quickly in these two areas:</p> <p>1) Accelerate the reduction in GHG emissions. We need to move quickly to reduce the worst impacts of climate change, many of which we have been witnessing all over the world in the past few months.</p> <p>2) Move forward the plan to offer youth opportunity passes. Before I retired I was a principal of a charter school in City Heights. Many of my students were low income and lived at a distance from the school. The school itself had to purchase bus passes for the students so they could attend. Providing low income students passes should be a high priority and offered as soon as possible.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
E289	Xi Li	SanDiego350	<p>While I want to thank the staff at SANDAG for their strides in addressing climate and equity in this Regional Transportation Plan draft, this plan doesn’t move quickly enough to meet the urgency of the climate crisis and give those reliant on transit the relief they need.</p> <p>We ask that you move faster in meeting targets for emissions reduction, transit projects, and the</p>	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. 			hours of service and frequency of transit so that our public transit system can be a meaningful alternative to cars.	Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
E290	Ynoi	N/A	Provide more secure and safe transportation for all. I took the trolley once and then the bus going to the airport. I noticed how filthy the trolley was at that time, the trash were all over. homeless people came in and out looking for food inside and even sitting in the handicapped reserved seats. You should provide security at all times and made sure that no eating and drinking should be allowed. Cleanliness and safety should always be the priority.	Operational subsidies are included in the Regional Plan. Every trolley includes security cameras and roving transit security officers. The current policy does not allow for drinking or eating on transit services.
E291	Zainab Salih	Barrio Logan College Institute/El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>The plan looks very interesting and promising. I can see it will help the underserved communities in El Cajon. Providing public transportation can help them to go out and engage with other activities outside El Cajon. The plan to provide easy-to-use, easy-to-access public transportation will help them to come over this obstacle. Also, the goal indicating ways access for students and the workforce to reach their location in a timely manner; this is huge for our low-income families. Students usually pick the nearest university or even change to the community college because of transportation issues. I knew about the application on the phone; I would like to see if it will be provided in different languages. We need to communicate with the parent using their native language. Today parents are tomorrow seniors, and the Arabic language will be an essential aspect to avoid confusion and encourage utilizing this facility and the transportation. App, Maps, and messages communicated during the road are necessary to be provided in different languages.</p> <p>Training for families on using the transportation, routes, and app will bean essential step to start establishing the new norms. Starting with school students will plant a person in every household that has the ability and knowledge to advise and help riding the transportation.</p>	<p>We appreciate your support and feedback. One of the Regional Plan’s near-term actions includes developing a Digital Equity Strategy and Action Plan that will address regional accessibility gaps in communications infrastructure, technology, and digital literacy. We have been working with our Community-Based Organization partners (or CBOs) to ensure that language translations (such as for Arabic) and translated educational resources on transit are readily available as we advance with our next OS system and build upon improving our existing transportation systems.</p> <p>Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a>.</p>
E292		El Cajon Collaborative	<p><b>**Comment submitted to SANDAG via El Cajon Collaborative from presentation from El Cajon Collaborative on the Regional Plan on July 6, 2021**</b></p> <p>Enthused to see how transportation is addressing a transformation that is way overdue, that is all inclusive of its community members.</p> <p>I wanted to also hear what SANDAG is doing to address economic barriers the community is experiencing with accessing affordable public transport. Will you be offering equity focused supports such as financial assistance or reduced fares for community members to increase their ridership.</p>	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.

V1	Glen Gillies	N/A	<p>***TRANSCRIPTION - VOICEMAIL***</p> <p>I live in the north county of San Diego. I'm calling to leave some information and thoughts about this proposed mileage tax. I read on a local news website that feedback was being collected through the end of today. My two cents worth is that, If mileage is taxed I'm going to cut down the amount of mileage that I actually drive. I'm going to consolidate trips. I'm going to use less gasoline. And that doesn't seem overall like a good way to support the local economy. I'm sure I'm not the only one who will have to rethink running to the store every other day and that kind of thing.</p> <p>I'm a full-time caregiver for my elderly mother. I'm technically unpaid, my small business closed during the pandemic, And I don't feel like taxing.... and we know California and San Diego have high taxes everything....I don't feel like adding a tax, psychologically a good way to go, for San Diego. I'm sure I'm not the only one like I said who will consolidate trips. think twice about going out. and will not actually spend more money on gasoline and so those taxes are collected.</p> <p>So those are my thoughts.</p>	<p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.</p>
V2	Lily Feingold	N/A	<p>***TRANSCRIPTION - VOICEMAIL***</p> <p>I'm calling about this proposed mileage, taxation. I'm I thought it was a joke. I thought it was an urban legend and apparently this is real. So I would like to get more information about it, and I'm against it. And so, I'd like to hear what SANDAG is thinking with this kind of madness. So thanks, look forward to hearing from someone. Bye.</p>	<p>Nationwide states and regions are confronting the shortfalls of gas tax revenues to fund maintenance, operations, and construction of their transportation systems. The federal gas tax was the largest source of transportation funding for many decades. However, the federal gas tax per gallon has not changed since 1993, that is when the minimum wage in California was \$4.25. The federal gas tax does not grow with inflation and the purchasing power of that source has diminished over time. States and regions have implemented their own sales and gas tax measures to try and meet the needs of their transportation systems. However, the best tax measures tied to fossil fuel consumption will continue to erode in time as vehicle technologies change.</p>
V3	Rebecca Neary	N/A	<p>***TRANSCRIPTION - VOICEMAIL***</p> <p>I live in Jamul. And I sent an email at public information at SANDAG.org, but I wanted to tell you about a person. I'm going to have him call you too, but he'll be nervous. You are proposing with other government organizations, a potential gas Usage Tax, and people who are low-income like me, or my friend who makes about \$20,000 a year, will be impacted by this.</p> <p>If we lived in town, I used to live in the city of San Diego and used to take buses everywhere. I had a car, but sometimes it'd sit for three or four days. I'd have to go start it, I wasn't driving it enough, I didn't want the battery to run down.</p> <p>My friend, he lives in El Cajon, and if he had one job for eight hours a day he could go on public transit. But as it turns out at 70 he's still working, he goes to nursing homes. He put on entertainment which is psychologically very important. And then he goes from place to place; he's working for about an hour to 4 hours at a time. And he has to travel more than once a day, and sometimes up to North County and so forth.</p>	<p>The San Diego Forward 2021 Regional Plan is a federally required long-range planning document with horizon years of 2035 and 2050. It is a requirement to provide a reasonable and feasible funding plan. The road usage charge may be phased in as gasoline sales continue to be phased out through emerging technologies.</p> <p>SANDAG intends to use emerging technologies to provide a fast, safe, and reliable transportation system to the San Diego region. Personal vehicles will continue to be part of our transportation system, but we also intend to provide competitive transportation methods to the personal vehicle. By providing alternatives to the personal vehicle, we could actually alleviate highway congestion, make our roads and streets safer, and make our whole transportation system operate more efficiently.</p> <p>SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing</p>

			<p>He does carpool with his son, they go together, and they have a minivan, and its very good on mileage, but nevertheless its gonna take a big chunk out of what they make. He just can't afford it, he just can't. And neither of us can upgrade to even hybrid cars. We can't afford it. And that's what happened, there are people that care about the environment. I don't drive everyday. My car is parked, still; because I'm retired. I drive about twice a week, only down to El Cajon, and I combine all my errands, get three or four errands in all at once.</p> <p>And if I do go to the beach areas, my friend and I go together, so we carpool. But this new gas cost will be too much. And it's not the right thing to do right now, what you really want to do is give us strong incentives to get electric vehicles if we can.</p> <p>My number is ***-***-****</p> <p>I'll also have him call for himself, but I'm really better at being a shrill nag. He's a really nice man. So I did the shrill nagging, and I did also write you an email about my own situation.</p> <p>No, a gas usage tax, probably not a good idea. Trying to encourage people to have better mileage cars and electric cars, is a very good idea. But you have to help us, because we can't afford them. It just seems like the only way we can do this.</p> <p>When I used to live in Boston, I could go everywhere, I never owned a car. Till like 30 and I moved out here. Owning a car, I still use public transit, but now in this rural area I cannot. And I outlined in my own email reasons a person in these rural areas cannot.</p>	<p>revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.</p>

# Appendix G Attachment 7D: Public-Meeting-Sourced Public Comments and Responses

SANDAG held six virtual open houses and two public hearings on the draft 2021 Regional Plan in June 2021 and July 2021. Comments provided during each meeting were recorded as public comments on the draft 2021 Regional Plan. Public comments were also recorded from the May 28, 2021, Board of Directors meeting when the draft 2021 Regional Plan was released for public review and at the SANDAG Social Equity Working Group meeting held on August 5, 2021. All ten of these meetings and links to available recordings are listed below:

- May 28, 2021 – SANDAG Board of Directors Meeting (full video recordings: English: [youtu.be/2cBPmgFM3vo](https://youtu.be/2cBPmgFM3vo), Español: [youtu.be/V8yqXQSWVtw](https://youtu.be/V8yqXQSWVtw))

<b>May 28, 2021 – SANDAG Board of Directors Meeting</b>				
M1	Alicia Sanchez		<p>Buenos días mi nombre es Alicia Sánchez vivo en National City y mi testimonio es sobre el Plan Regional de Transporte. Yo uso el transporte público para ir a mi trabajo y mi experiencia es que cuando salgo de mi casa por las mañanas tengo que caminar unas cuadras para tomar el autobús en ese momento siento que vuela el aire limpio pero cuando llego a la parada del autobús ya no es lo mismo puesto que huele mucho a humo. Por eso quisiera pedir un cambio pronto no esperar muchos años para que cambien los autobuses de gas natural a que sean eléctricos ese cambio mejoraría el aire contaminado que tenemos en mi comunidad. Yo tengo mi esposo enfermo y sé que le hace mucho daño y vísperas de la contaminación. Por favor les pedimos un cambio lo mas pronto possible gracias.</p> <p>***</p> <p>Good morning, my name is Alicia Sánchez and I live in National City. I would like to comment about the Regional Transportation Plan. I take public transportation to go to work. When I leave my house in the morning, I have to walk several blocks to take the bus and during my walk the air smells clean; but when I get to the bus stop it smells like smoke. That is why I would like to ask for a change soon, do not wait many years to change natural gas buses into electric buses. This change would improve air</p>	<p>El Plan Regional 2021 propuesto apoya la electrificación de los autobuses del transporte público en la región y la regulación estatal de Transporte Público Limpio e Innovador. Los Anexos A y B incluyen el compromiso de SANDAG de invertir \$657 millones de dólares hasta el 2050 en autobuses e infraestructura cero emisiones que apoyarán los Planes de Implementación de Autobuses Cero Emisiones (ZEB, por sus siglas en inglés) de MTS y NCTD. SANDAG propone una inversión de \$325 millones de dólares entre el 2025-2035. Puede encontrar los Planes de Implementación de los ZEB de las agencias de transporte público en el sitio web de CARB: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>***</p> <p>The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and</p>

			quality in my community. My husband is sick, and I know that pollution is really bad for him. Please, we ask you to make changes as soon as possible. Thanks.	infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a> .
M2	Ariana Federico	Mid-City CAN	I am the lead organizer at Mid-City CAN and also a transit rider of 26 years. I'm actually here to ask the board to support no-cost transit passes for all youth ages 24 and under in our region. We need the RTP to commit to implementing youth opportunity passes as early as 2022 or as soon as funding becomes available. We need the board to avoid any delayed implementation. We've already seen that similar programs that exist here in within California like Alameda County, San Francisco have provided this program, and we know that these programs work. We have young people here today to share the positive environmental and social outcomes of implementing YOP. Youth opportunity passes is an investment San Diego must implement if we want to really have true meaningful conversations about equity and the future of transit in San Diego overall. Please include the immediate implementation of youth opportunity passes in the 2050 Regional Transportation Plan.	One of the Implementation Actions listed in Appendix B will be a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M3	Ava Raymond	Mid-City CAN	I'm here with Mid-City CAN. I'm a student at High Tech High Mesa as well as a transit rider. I ask you to support no-cost transit passes for all youth ages 24 and under in our region. We need the RTP to commit to implementing youth-opportunity passes as early as 2022 or as soon as funding becomes available. We need to avoid a delayed implementation. I am asking you to support this because the youth living in your communities today need youth-opportunity passes to connect with school, work, internships, and other opportunities. From personal experience, I know how much these passes could benefit San Diego's youth. Many of my peers rely on the city bus to get to school because our school has no school bus, and the fees for these services add up quickly. We know the youth-opportunity passes work because similar programs already existed with great success in Alameda County, Boston, San Francisco, and most recently Sacramento and Los Angeles. Please include the immediate implementation of youth-opportunity passes in the 2050 Regional Transportation Plan.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M4	Bee Mittermiller	SanDiego350	I'm with SanDiego350. The release of the 2021 Draft RTP is a remarkable day in the history of SANDAG. The plan's use of emerging technologies, data-driven planning, and community input has the potential to usher in decades of progress in combating climate change, achieving equity for our communities of concern, protecting the environment, and providing connected mobility options for all San Diegans. Staff has put together a thorough and comprehensive report. SANDAG leaders, thank you for your vision and leadership. We look forward to providing comments on aspects of the plan that will ensure its success.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
M5	Bertha Rodriguez	Climate Action Campaign	I am with Climate Action Campaign, which is a member of the San Diego Green New Deal Alliance. We are encouraged by SANDAG's new direction and thank the staff for their work on the draft. For the final plan, we urge support to maximize emission reductions and to center social equity. I ran a youth center in San Ysidro right in front of a bus stop, but few youth would use it and many of my youth would walk down from San Ysidro High School because the bus routes and stops were not accessible and many of them could not afford to use public transportation daily. That is why it is imperative that we have youth opportunity passes, no-cost transit passes for youth 24 years old and under in order for youth to be able to go to school, after-school programs and jobs. And please prioritize investments in the communities of front lines of environmental injustice and climate crisis.	<p>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
M6	Brenda Garcia Mijan		I live in South Bay. As a woman I can tell you, as a woman who relies on public transit I can tell you that transportation is an issue of safety. It's happened to me many times that while I'm waiting for the trolley or the bus, I am harassed by men and instead of getting a more frequent transit all I see is just more police presence in stations. Now we all know that that's not the solution, and I know that for a fact because I have had a chance to live in other cities in the United States and also in Europe, in Mexico, and the reason I felt safer in those places was because of their public transportation system which didn't make, which doesn't make people wait for half an hour for a trolley. That being said, I share this experience because I think that the Regional Plans need to take into consideration safety and just as a final comment, the Regional Plan needs to ensure that we reduce VMT and our greenhouse emissions.	<p>SANDAG, MTS, and NCTD are taking steps to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements. SANDAG will be working hard with the help of all of our passengers and representatives to ensure that this plan gets implemented.</p> <p>Additionally, SANDAG staff is bringing forward an item to the SANDAG Transportation Committee and the Board of Directors to amend the agency budget and act now to increase services on transit lines that have infrequent service in the evenings and late nights. Further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
				<p>proposed final 2021 Regional Plan.</p> <p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
M7	Brian Puller		<p>I'm going to give a special thanks to staff for putting on such an effective and comprehensive presentation. We also would like to thank SANDAG and their continued outreach efforts to help ensure underserved communities are at the table at this important transportation junction. The decisions that are made at times, new transportation projects have physically divided communities or impacted access to community services resulting in social and economic costs. It is important, critical to understand the impact of transportation and other infrastructure investments on our most vulnerable communities in order to better plan for the future. For these reasons environmental justice principles and social equity goals are an important consideration in the Regional Plan. Transportation projects have a significant affect on the quality of life in our underserved communities. So again, thank you for being to responsive to our needs.</p>	<p>We appreciate your support and feedback representing our environmental justice communities. Please continue to follow along in this process by visiting <a href="https://SDForward.com">SDForward.com</a>.</p>
M8	Carmela Munos	Vista Community Clinic	<p>I work for the Vista community Clinic, one of the cities doing community outreach for SANDAG in North County, San Diego. I have been working for adults in youth of several years, especially underserved communities. Many of these residents rely on public transportation because they cannot afford a car. So many of these families are very excited about the 5 Big Moves, they believe this new plan is more fair and equitable for everyone. The new plan will benefit everyone not only drivers. Thank you SANDAG all the efforts in creating an innovative plan that will provide options for all residents in San Diego. Thank you also for translating important chapters of the Regional Plan, this will help non-English speaking community members be more involved in the decision-making process. Looking forward for the public comment period.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://SDForward.com">SDForward.com</a>.</p>
M9	Carol Kim		<p>We're really excited to see this RTP that's been proposed today. It's got a lot of great things in it, and we're definitely going to be digging into the details as we move forward. I'm really looking forward to seeing some of these really good quality, good paying jobs go to local workers here in San Diego and absolutely on board with all the comments from our partners at the Quality of Life Coalition, as well as the Equity Committee talking about accessibility and the importance of including environmental justice communities and really tackling our transmission - our emissions and being able to lower those along with VMTs. So again, thank you for the work that's gone into this, and we look forward to continuing to partner with you. Oh, and I think Edwin G. is gonna be coming on, and you called on him. He was having issues with his technology.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://SDForward.com">SDForward.com</a>.</p>
M10	Carolina Goldwin	Environmental Coalition	<p>I'm with the Environmental coalition and the San Diego Transportation Equity working group. We know that the transit system doesn't work. It doesn't connect people to jobs and we have the seventh worst ozone pollution in the nation. 41 percent of our greenhouse gas emissions are coming from transportation so we submitted a letter with all our comments. We have short-term solutions that need to be seen in our communities fairly soon so that we could transport us into the future as soon as possible. We ask that the bus system be transformed by 2025, 24/h service, the youth opportunity pass, anti-displacement strategies, bathroom network, emergency ready system. All by 2025 a best electrification full transition by 2030 and long-term solution addressing the blue line. The blue line is the backbone of our transit system it should be our biggest move. We need to ensure the blue line infrastructure is not defunded and left to age without major investments.</p>	<p>The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. Additionally, the transit agencies will continue to electrify their fleets in response to state mandates. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B).</p>
M11	Christopher Allen		<p>I'm a San Diego native, proud Southwest Union carpenter and have helped build San Diego infrastructure for more than a decade. I have personally seen the relief in congestion and improvement of our communities by rapid transit, elevated rails, heavy rails, bike and walking pathways. We need to build forward-thinking infrastructure like this in America's finest city and build it with a skilled and trained workforce as well. Investment to infrastructure should also go back to the community members that build these projects. I support this Regional Plan and let's build community wealth together.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://SDForward.com">SDForward.com</a>.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
M12	Craig Jones	Alliance for Regional Solutions	I'm a representative to the social equity working group for the Alliance for Regional Solutions. The alliance is a robust collaborative of over 75 human serving and community serving organizations we also have representation from the cities of North County and the City of San Diego. Our mission is to provide services and improve the lives of the disadvantaged and there are significant underserved communities in North County. This plan is dramatically important to help them. Speaking of social Equity I want to reference a couple of things in the plan- well my time is wrapping up- I want to refer everybody to chapter 2 figure 2.4. This is a map showing a coverage of flexible fleets into the regional transportation system. Everybody go look at this figure 2.4 it is dramatically important to achieving social equity.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .
M13	Daniel Wisma	Ironworkers Local 229	I'm the organizer with Ironworkers Local 229. I've been born and raised in San Diego, and I believe this proposed Regional Transportation Plan would make such a positive impact within our community, including thousands of good paying jobs here in San Diego. We're supportive of the changes being proposed in the 2021 RTP and hope that the board will be too.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .
M14	David Johnson	San Diego Union Iron Workers out of Local 229	I'm with the San Diego Union Iron Workers out of Local 229. We're glad to see how much work has been put into this envisioning on how we can improve our transportation system in San Diego County. This is how we can provide the first-time safe, convenient, and realistic alternatives to driving. Will also improve local roads. It's long overdue. San Diego workers everywhere and across all industries will benefit from those options, as well as benefit from the positive climate impact we'll see through reduced carbon emissions. We're looking forward to partnering with SANDAG and the community in transforming San Diego County for better. We would love to be a part of this transportation movement in San Diego.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .
M15	Delia Contreras		<p>Buenos Días mi nombre is Delia Contreras. Yo nací en Texas viví toda mi vida en México desde chiquita me llevaron regresé cuando tenía 32 años. En el 2004 sube la custodia de cuatro niños mis nietos y mis mi comentario es este mi experiencia es que cuando tuve esa experiencia de tener cuatro niños conmigo no no podía yo sostenerlos no conocían sistemas tenía y regresé muy joven Estados Unidos. Pero no conocía el sistema a esa edad cuando ya tenía yo cuatro nietos y mi experiencia es que en esta comunidad de City Heights es nosotros tenemos la línea morad. Y pase este no costo para los jóvenes porque yo supe lo que era no no sacar a mis nietos a ningún lado por no tener los recursos para llevarlos a ninguna parte. Ojalá que ustedes comprendan la necesidad que hay en mi comunidad y un minuto no es suficiente para contar una experiencia cuando hay niños con hambre con necesidad que no puede.</p> <p>***</p> <p>Good morning, my name is Delia Contreras. I was born in Texas, but I was taken to Mexico when I was a little girl, and I came back when I was 32 years old. I assumed custody of my four grandchildren in 2004. My comment is about my experience. When I had four children with me, I could not support them. I was not familiar with the system, and I came back to the United States when I was very young. But I did not know the system when I had my four grandchildren with me, and my experience is with the Purple Line that we have in City Heights. Even though children did not have to pay, I know what it means not taking my grandchildren anywhere because I did not have the resources to take them anywhere. I hope you understand the needs of my community. One minute is not enough to share our experience when children are hungry, and we have needs that we cannot satisfy.</p>	<p>Gracias por expresar sus inquietudes. El Plan Regional 2021 fue desarrollado en coordinación y con la colaboración de organizaciones comunitarias (CBO, por sus siglas en inglés) que representan a las comunidades de justicia ambiental. SANDAG realizó una evaluación de las necesidades de la comunidad trabajando con sus aliados de las CBO para evaluar las necesidades y oportunidades de los proyectos del Plan Regional 2021 a través de un significativo y representativo proceso que promovió la participación de la comunidades históricamente desfavorecidas . El propósito de la evaluación de las necesidades fue analizar exhaustivamente los servicios de transporte existentes y evaluar oportunidades para nuevas soluciones de transporte que aborden las necesidades específicas y los diversos contextos de las comunidades de la región. Este trabajo se integró al Anexo H del Plan Regional 2021.</p> <p>***</p> <p>Thank you for expressing your concerns. The 2021 Regional Plan was developed with coordination and collaboration with community based organizations representing environmental justice communities. SANDAG conducted a community based needs assessment working with the CBO partners to evaluate needs and opportunities for 2021 Regional Plan projects in historically underserved communities through a meaningful and representative community engagement process. The needs assessment was intended to provide a comprehensive evaluation of existing transportation services and assess opportunities for new transportation solutions that address the unique needs and diverse backgrounds of communities within the region. This work was integrated into the 2021 Regional Plan, Appendix H.</p>
M16	Elizabeth Lou		I am privileged to present to you today. I want to first thank SANDAG for being so inclusive in our community. I have seen great leadership in SANDAG including us, the refugees, the immigrants, and low-income here in San Diego, to understand the transportation system and services in this great city and county. So Nile Sisters is working with all refugees, immigrants here in San Diego, and we are also serving refugees from a different background in East County in El Cajon city with our wonderful partner Newcomers Support and Development, Mr. Tuama. I believe he's here so I'm here to say.	We appreciate your input and feedback in the Social Equity Working Group. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .
M17	Esperanza Gonzalez	Environmental Health Coalition	Mi nombre es Esperanza Gonzalez, residente de City Heights y promotora de la Coalición de Salud Ambiental HC. Muchos residentes en mi comunidad dependemos del servicio de transporte público el mismo servicio que no ha mejorado durante muchos años. Es neciciente, sólo para trasladar de un lugar a otro. Tenemos que esperar bastante tiempo así esté cerca donde te diriges. En la parada de los autobuses es muy comunidad mirar cara de angust y desesperación de coraje y potencia porque no	SANDAG está consciente de que se debe hacer algo ahora para tener un transporte público rápido, frecuente, confiable y accesible, particularmente en la rutas de mayor uso. Nuestro personal llevará este asunto ante el Comité de Transporte y la Mesa Directiva de SANDAG antes de la aprobación del Plan Regional 2021 para modificar el presupuesto de la agencia y tomar medidas ahora para invertir en un transporte público que beneficie a

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			<p>llega el bus porque nos gasto y sabemos que esperar bastante tiempo así esté cerca donde la parada de autobuses e impotencia porque no llega el gas porque se nos pasó y sabemos que va a tardar el próximo y estamos mirando y mirando el reloj. El tiempo que pierdes en las paradas del autobús en el tiempo valioso para estar con tu familia estar en casa ayudándoles a tus hijos hacer la tarea es por eso que existimos en el plan Regional de transporte prioridades descentralizadas en comunidades como City Heights necesitamos mas frecuencia, mas rutas y servcio 24 horas en todos las comunidades. San Deigo tiene las familias trabajadoras merece un servicio mejor con mucho mas frecuencia para tener mas tiempo con la familia. [time expired]</p> <p>***</p> <p>My name is Esperanza Gonzalez, I live in City Heights, and I am a promotora (an advocate) with the Environmental Health Coalition of CH. Many residents in my community depend on public transportation services, the same services that have not been improved in many years. We need to travel from one place to another. We have to wait a long time even if you are going nearby. The faces you see at the bus stop are of anguish, desperation, anger, and helplessness because the bus is not arriving, because of the cost, and because we know we have to wait a long time even if the bus stop is close by. Helplessness because when the bus does arrive, we miss it and we know that the next one is going to take a while and we look at our watches over and over again. The time we waste at the bus stops is valuable and could be used to be home with your family, helping your children with homework. That is why we ask the Regional Transportation Plan to decentralize their priorities in communities like City Heights. We need more frequency, more routes and service 24 hours in all our communities. Working families in San Diego deserve a better service, one that is much more frequent so we can spend more time with our families. [time expired]</p>	<p>las comunidades de justicia ambiental. El objetivo de esta acción es aumentar los servicios en las rutas que tienen un servicio poco frecuente en las noches y madrugadas y/o crear subsidios para las tarifas de los jóvenes usuarios. También se modificará el Anexo A del Plan Regional 2021 final propuesto para aclarar aún más las mejoras propuestas para la red de autobuses, incluyendo mejoras en la frecuencia y el alcance del servicio.</p> <p>***</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
M18	Gary Hewitt		<p>I am a resident of San Diego. It's great work by SANDAG staff on what can really be a truly transformational plan. My question is what if we build all these great new projects and people just keep driving? Driving a car will continue to be a very attractive option, and people will need to be nudged into making the travel decisions which help make this plan work. So I think this plan can be supercharged with a very low cost program called TDM, or Transportation Demand Management, which reduces VMT by working with employers to reduce commute trips. The draft plan has a voluntary TDM program, and what I'm proposing today is instead having a mandatory TDM program, requiring employers with more than 50 employees to reduce trips to their work site by 20% over the first 5 years in the Regional Plan. So for some employers this would be providing incentives for carpooling and van pooling, flexible schedules, and allowing employees to work from home. For others who are not as flexible, it may be providing on-site bike parking or free transit passes for workers. For employees who can't implement these programs or meet the goal...</p>	<p>SANDAG has an existing TDM program, iCommute, which currently offers employers and commuters customized solutions for encouraging alternative transportation options. Some of these programs include offering incentives for carpool, vanpool, and transit; promoting shared mobility; promoting on-site amenities for commuters such as bike lockers and showers; and offering resources for developing telework/flexible work schedule programs. The 2021 Regional Plan proposes a Transportation Demand Management Ordinance that would require employers over a certain size to provide transportation benefits and amenities that encourage sustainable transportation choices. These types of TDM ordinances exist in other regions across the state. A near-term implementation action would be to complete a Transportation Demand Management Ordinance Policy Analysis. This policy analysis would detail the employers that the ordinance would apply to and mechanisms for implementation and enforcement.</p>
M19	Goyo Ortiz	Casa Familiar	<p>I am the community development choreographer at Casa Familiar in San Ysidro. As a community agency we're partnering with as a CBO with SANDAG for this endeavor and I would like to congratulate the SANDAG team for its comprehensive view of equitable regional transportation plan and I would like to ask members of the board to think about our working-class neighborhoods as you analyze this plan. Many of our residents depend on the public transportation not just through the 9 to 5 work week but on a 24/7 schedule, living under polluted air from our regional traffic from the international border. And we would also like to think about the blue line as it's been the backbone for our light rail transportation system for year and we would like for it to be given the priority it and it's communities [time expired]</p>	<p>The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. Additionally, the transit agencies will continue to electrify their fleets in response to state mandates. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B).</p>
M20	Gretchen Newsom	IBEW Local 569	<p>I am speaking on behalf of over 3,500 members of the IBEW Local 569. Today marks an exciting chapter for transportation in San Diego County. This new 5 Big Moves Regional Transportation Plan represents a milestone opportunity for elected leaders to finally abandon obsolete practices to bring our region into the 21st century, prioritize environmental justice, reduce dangerous climate emissions and create high road jobs for our local workforce. The moment to shape a healthier future where all residents to access safe, affordable and convenient transportation. We will be working with out quality of life coalition partners to review the specifics in greater detail and will be providing feedback on this very comprehensive document. We wish to offer our sincere congratulations to SANDAG staff on this major accomplishment. We look forward to continued collaboration.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
M21	Jacob Mandel	San Diego Bicycle Coalition	I'm the advocacy manager for the San Diego Bicycle Coalition. We're excited to enter the next phase of making our region's transportation system more sustainable, equitable, and efficient. The Bicycle Coalition is encouraged by the level of detail in the plan, and we thank SANDAG staff for getting this done. As we work our way through the draft to provide specific feedback, we hope that SANDAG leadership and our elected representatives make the decisions necessary to get San Diegans onto bikes, buses, trains, and out of their cars. San Diego's transportation system is long overdue for fundamental change and the Draft 2021 Regional Plan is just the beginning.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdforward.com">SDForward.com</a> .
M22	Jennifer Olguin	Environmental Health Coalition	I'm from San Ysidro. I've been involved with EHC since 2020. I live closer to a freeway than I do to a bus stop. We are closer to developing health issues than we are to public transportation. I urge you all to push for the blue line express and to improve the bus system now. As a teen I walked to places in the dark with my friends because public transportation was unreliable. I felt my heart racing because I was scared of what could happen. We risked our safety because it was faster to walk home than it was to take public transportation. Now I am older yet more terrified to use public transportation. I'm constantly on the look out for anything that could be a threat while I wait for that trolley or bus that often comes many minutes late. Life is precious and anything could happen within that time. Especially to young women waiting alone. The blue line express and buses must run faster and punctually to guarantee safety for everyone. We all deserve to experience comfort and knowing that we can use public transportation to get home quickly and safely.	SANDAG, MTS, and NCTD are taking steps to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.  The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.
M23	Jessie O'Sullivan	Circulate San Diego	I work with Circulate San Diego. Thanks for the presentation on the Regional Plan. At Circulate we'll be doing an analysis of how this plan compares with the 2015 plan including phasing and projects and we will be sharing our conclusions with staff and board members. We appreciate the help from SANDAG staff for sharing this information with us, prepare this analysis. In our preliminary review we were pleased to see funding for vision zero and several bus projects committed to early phases of the plan. San Diego needs a Regional Plan that prioritizes transit and active transportation. Again we look forward to digging in and we'll let you know what we think.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdforward.com">SDForward.com</a> .
M24	Joe Hood	Green New Deal Alliance	I am with the Green New Deal Alliance. We are enthusiastic and support SANDAG's plan. About half of San Diego greenhouse emissions come from transportation. To reach zero carbon, San Diego must drastically reduce emissions by shifting people out of their fossil fuel cars in to multiple, sustainable, and varied modes of transportation. We also urgently need high-density infill development. For the final plan, we urge you to maximize emissions reductions, prioritize investments communities on the frontlines of environmental injustice and the climate crisis. San Diego can't meet its climate goals without implementing your plan. Thank you to the board and staff who are pushing for a transportation system that centers social equity, create good union jobs, and secures climate safe future for all.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdforward.com">SDForward.com</a> .
M25	Jorge Gonzalez	EAC	I'm a regional community organizer with EAC and currently living in City Heights since 2012. I'm a San Diego, Tijuana border native fronterizo and have been living here most of my life. I'm a father of two and this topic is very important to me as I understand it will impact the quality of life for my kids and future generations and the RTP needs robust, holistic, and immediate investment centered in environmental justice communities. In order to alleviate heavy pollution that stand for multiple sources like buses and cars. If we want to transform the culture and take away the negative connotations of riding public transit we need community-based visionary strategies that stem from public transit riders experiences instead of financial gain formulas. As an organizer, I've heard many of the fares that discourage families to use public transit, even when living next to MTS trolley stations from the high cost of riding public transit to the connectivity that's lacking. All those issues really create situations that normalizes two bedroom households in City Heights to have three or five cars. My parents for instance live in Chula Vista. [timer stopped]	The 2021 Regional Plan includes investments to make public transit more convenient and affordable. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.
M26	Jose Franco Garcia	Environmental Health Coalition	I am with Environmental Health Coalition, part of the Transportation Equity Working Group. Just wanted to echo a lot of things that many people have said today about the need to improve the transit system so that it is more accessible. Getting more people on transit allows for more safety, more you know people use it not just when they have to but because it is convenient and it allows you to get to the places that you need to go to. Also echoing what other folks have said about the importance of this RTP or what we should be looking to do moving forward is making sure that it is connecting people where they live to where they need to go, whether that's work, whether that's getting their families to places. All of that has been echoed, and I want to agree with all that, and lastly what I say is	A better transit system is a fundamental component of this Regional Plan. Revenues to fund the transit projects don't come in all at once but dollars that are available are applied to ensure that the best projects are initiated first and that those projects address social equity considerations.

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			that workers and people in San Diego have been waiting for decades for a better transit system. So hearing that some of these things are not going to happen for another decade is discouraging. We need these improvements to happen now and to get us moving in the right direction as soon as possible. Thank you for this time and please listen to the people who spoke today and talked about the importance of moving this forward soon.	
M27	Katherine Rhodes		Thank you for such a thorough report you have here. I put it all together, and there's 4,175 pages to look through, but one of the comments I just wanted to make on Appendix A, the Transportation Projects, Programs and Phasing. I was wondering if you could add a column to the table for how much greenhouse gas emission reductions or additions that each project will actually provide and so if you could just add a column there so that way you know people could actually see it right next to how much it cost and how much it would reduce greenhouse gases. And then also I'm very much in favor of the free transit for youth. I think that if you get people young, and they're used to the transit, they might actually use it in the future, might not ever actually buy a car so thank you so much.	The overall impact on the transportation system on GHG emissions is shown in Appendix T in the various plan years (2025, 2035, and 2050). SANDAG's modeling tools don't allow for the calculation of contributions from individual projects and, even if possible, that type analysis would not appreciate the interrelationships amongst projects given the benefits of the system as a whole (rather than just a collection of individual projects).
M28	Kelvin Barrios	Laborers Local 89	I am the director of government affairs with Laborers Local 89 representing our business manager Valentine Macedo and our over 3,600 members in San Diego County. We would like to thank the work that the board and staff have put into bringing this new regional plan forward, but we do have some concerns on how exactly this will be funded and questions around what type of ballot measure the board may be already considering or outside efforts already in the works. We have concerns about talks being had around not including a taxpayer oversight committee or project list and stakeholders being left out of process. We do support the comments from our friends at CPI around an early action program, the Purple Line including City Heights, and the building of the Blue Line Express. We look forward to providing more detailed public comments in the future and staying engaged during this process.	<p>The Cost Estimation Methodology and Funding Strategies for the 2021 Regional Plan were presented to the SANDAG Board of Directors on March 12, 2021, Item No. 8B. This report and presentation described the various funding assumptions developed for the draft 2021 Regional Plan. The entire Board meeting can be found at <a href="http://www.sandag.org">www.sandag.org</a>.</p> <p>Appendix A includes specifics on projects such as track work and grade separations on the Blue Line, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</p> <p>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582.</p>
M29	Kim Heinle	Bayside Community Center	I am with Bayside Community Center located in Linda Vista. We are a contracted CBO with the Social Equity Working Group, and we've been a part of the Regional Plan for years, and we're extremely grateful for the opportunity this morning to provide public comment and to weigh in on the plan. It's been exciting to see how much more progressive the plan has become over the years and how much more digestible and understandable it is to our common public. We know that this is in large part thanks to the working group, the Social Equity Working Group, that's helping to bridge this gap between regional planning and our community members who are directly impacted. Back in 2015, we got the Quick Reference Guide, and now we're getting the guide and now we're getting the plan translated into Spanish, and that's a huge step forward, and we're grateful for the SANDAG team, the board, my fellow CBOs, and of course our community members who are giving their time and input to help this Regional Plan in both an equitable and a sustainable direction.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
M30	Kira Tina	Center for Policy Initiatives and Transportation Social Equity Working Group	I'm a researcher and policy advocate at the Center for policy initiatives and transportation equity working group. The Regional Transportation Plan is our region's opportunity to create a vision for transportation that will work for everyone. That is why the Transportation Equity Working Group's ten big moves to transportation justice must be included in the RTP. For the final plan we urge the Board to first include a blue line express with frequent trips and 24/hr service. Second, continue serving the purple line serving central city heights and ensuring RTP prioritizes investments in the communities on the front lines of environmental injustice by phasing projects earlier in the implementation timeline. By investing in projects like the blue and purple line we can transform communities by connecting working people to job centers and creating reliable systems for those who need it most. While also making public transit a realistic option for those who currently rely on driving. Also including these transit improvements early in the RTP implementation is paramount to helping low income families, youth, and low wage workers who rely on transit better address their needs and improve quality of life.	The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B). Also, transit subsidies are a component of the proposed Final Plan and implementation of those subsidies would include a consideration of low-income and youth populations.
M31	Magdalena Serda		Buenos días a todos Yo vivo en Imperial Beach desde el 2001 pero en el 2004 mi hija Magdalena entró a la misa aquí entró a la Southwestern College y entonces todo se complicó porque ella tenía que hacer tres horas al día de transporte. Para el 2006 mi hija Entonces ahora Magdalena entró a la universidad estatal de San Diego y esto le significaba ella 3 o 4 horas diarias de transporte para poder	SANDAG está de acuerdo con sus inquietudes y creemos que este Plan Regional transformará cómo nuestros residentes viajan, lo que permitirá liberarnos económicamente de las barreras del transporte. ***

			<p>solucionar esto si nuestras hijas nuestras hijas querían ir a una universidad y tener una carrera profesional en la mejor vida tuvimos que comprar un carro para cada una haciendo un impacto enorme para nuestra economía el derecho de Educación se ve limitado por economía y el mal transporte. Ojalá que estén tenga mejores soluciones este estos cambios.</p> <p>***</p> <p>Good morning everyone. I have been living in Imperial Beach since 2001, but in 2004 my daughter Magdalena started classes at Southwestern College, and it was all very complicated because it took her three hours every day to travel in public transportation. In 2006 my daughter Magdalena transferred to San Diego State University and that meant spending 3 to 4 hours every day using public transportation. To solve this problem and because my daughters wanted to attend a university and obtain a professional degree, we had to buy each one a car which had a tremendous impact in our economy. The right to education is limited by the economy and poor transportation. I hope that there are better solutions and changes.</p>	<p>SANDAG agrees with your concerns, and we believe that this Regional Plan will transform how our residents travel, allowing for economic freedom from transportation barriers.</p>
M32	Marco Gorjardo		<p>Hola buenas tardes. Mi nombre es Marco Gorjardo, soy residente de North Park y soy nativo de San Diego y de Mexicali. Recientemente me integrado al equipo Regional de acción del EHC. Mi historia que voy a compartir es como joven usuario del sistema Público de camiones y se trata de crecimiento personal que yo tuve a través de las libertades que me dio este transporte público. Creo que es vital que le den prioridad en el plan Regional de transporte a los pases de autobús accesibles para jóvenes y para mejorar las rutas más eficientes dónde está la necesidad. Cuando yo descubrí como joven que podía depender de las rutas de camiones para salir de mi pueblo de Fallbrook y explorar independientemente el resto de San Diego [time expired]</p> <p>***</p> <p>Hi, good afternoon. My name is Marco Gorjardo and I live in North Park. I am from San Diego and Mexicali. I recently joined the Regional Action team of the EHC. I want to share what it means to be a young user of the public bus system. It is about the personal growth I experienced due to the freedom that public transportation gave me. I think it is very important to include in the Regional Transportation Plan youth passes and to improve the routes to make them more efficient where they need to be. As a young man, when I discovered that I could depend on the bus routes to leave my town of Fallbrook and explore the rest of San Diego by myself [time expired]</p>	<p>SANDAG sabe que se deben tomar medidas ahora para ofrecer un transporte público rápido, frecuente, confiable y accesible, particularmente en la rutas de mayor uso. Nuestro personal llevará este asunto ante el Comité de Transporte y la Mesa Directiva de SANDAG antes de la aprobación del Plan Regional 2021 para modificar el presupuesto de la agencia y tomar medidas ahora para invertir en un transporte público que beneficie a las comunidades de justicia ambiental. El objetivo de esta acción es aumentar los servicios en las líneas del transporte público que tienen un servicio poco frecuente en las noches y madrugadas y/o crear subsidios para las tarifas de los jóvenes usuarios. También se modificará el Anexo A del Plan Regional 2021 final propuesto para aclarar aún más las mejoras propuestas para la red de autobuses, incluyendo mejoras en la frecuencia y alcance del servicio. Una de las Acciones de Implementación enumeradas en el Anexo B es un Estudio del Impacto Regional de las Tarifas. Este estudio asegurará que las partes interesadas públicas tengan la oportunidad de expresar su opinión sobre las alternativas. Se espera que el estudio finalice en el año fiscal (FY) 2024 e incluirá una evaluación de los subsidios para las tarifas de las personas de bajos ingresos, los adultos mayores, los estudiantes y los jóvenes. Mientras tanto, el personal de SANDAG, MTS y NCTD está trabajando con las partes interesadas en un programa piloto de un año que puede ofrecer tarifas gratis a los jóvenes menores de 19 años.</p> <p>***</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
M33	Margarita Moreno		<p>Buenos días mi nombre es Margarita Moreno soy residente de Nacional City. El día de hoy estoy pidiendo que se mejore el sistema de transporte público. Una de las decisiones importantes para mí es el Plan Regional del Transporte y es que los autobuses de MTS tengan un precio más accesible para que la economía impacte tanto a nuestros bolsillos y también queremos pedir que sea más frecuente el servicio entre semana para los que van al trabajo. Otra de las cosas que me gustaría es que el transporte sea también los fines de semanas de igual forma ya que muchas familias es cuando salen con sus hijos y tenemos que esperar mucho tiempo para que podamos tomar el transporte. Queremos</p>	<p>SANDAG está consciente de que se debe hacer algo ahora para tener un transporte público rápido, frecuente, confiable y accesible, particularmente en la rutas de mayor uso. Nuestro personal llevará este asunto ante el Comité de Transporte y la Mesa Directiva de SANDAG antes de la aprobación del Plan Regional 2021 para modificar el presupuesto de la agencia y tomar medidas ahora para invertir en un transporte público que beneficie a las comunidades de justicia ambiental. 			<p>que comen encuentra nuestras recomendaciones. Gracias por escucharnos. ***</p> <p>Good morning. My name is Margarita Moreno and I live in Nacional City. Today I am asking for improvements to the public transportation system. I think that one of the most important decisions of the Regional Transportation Plan is making the price of MTS more affordable since this would benefit our pockets. We also want to request a more frequent service during the week for those that travel to work. I would also like public transportation to be the same on the weekends because when many families go out with their children, they have to wait a long time to use public transportation. We want you to take our recommendations into account. Thank for your listening to us.</p>	<p>subsidios para las tarifas de los jóvenes usuarios. M34	Maria Cortez	City Heights Development Corporation	<p>I'm a resident here of City Heights, and I also work with the City Heights Development Corporation. Also volunteer with Mid-City CAN. I am proud to say that I am happy to hear about, amen, the Purple Line coming through City Heights. 44 years - no project should take that long. I hope I'm still alive to see this because I want this to happen sooner, if possible, than 2035. I am so happy for SANDAG and the staff here to take on the opportunity to see us to do with the Purple Line, and also Todd knows how long it's been, and the pain and everything we've gone through here in City Heights. All of us deserve the same as everybody else, and also I am supporting the youth-opportunity bus passes for 24 years and under. It's a longtime going, but yes, our students deserve the same as everybody else, and this is for everybody in San Diego.</p>	<p>Commuter Rail Line 582 (Purple Line) is included in the Plan to serve north-south travel needs in Sorrento Mesa, National City, Kearny Mesa, and University Heights. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is completing a more detailed ridership analysis of this route. The analysis is studying an alignment that would include stations in City Heights and at San Diego State University (west campus). Also, transit subsidies are a component of the proposed Final Plan and implementation of those subsidies would include a consideration of low-income and youth populations.</p>
M35	Marisa Garcia		<p>I've been a resident here in Logan Heights my whole life. Although my neighborhood is abundant culture and close community, another thing we have in abundance here that is not so great is the pollution that we have to live in. It is a reality that we cannot escape because it comes from every angle, the port, the industry, the freeways, and all the vehicle traffic associated with them. On the clearest of days you can still see a faint haze of smog in our skies and it breaks my heart to know that many of us living here, especially the children growing up in this like I did, will inevitably suffer from breathing an other health problems. I'm aware that this issue cannot be fixed overnight but we can work every day to change the factors contributing to the problem. There are many bus routes that pass through our neighborhood and each one adds to the pollution we have. By electrifying our bus fleets, you can change the negative factor into a positive one and start reducing the pollution we face daily. I strongly encourage your support and electrifying our bus fleet by 2030 to help us gain a healthier community. Our lives are really at stake and we would really appreciate that.</p>	<p>The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>Also, in 2020, SANDAG entered in a Memorandum of Understanding (MOU) between the San Diego Unified Port District, and the California Department of Transportation to work cooperatively on "improving accessibility, sustainability, and economic vitality" San Diego Portside communities, such as Barrio Logan. The MOU specifically calls for the reductions of greenhouse gases and other pollutants, without compromising the health of local community members. SANDAG will continue to work closely to improve the health and quality of life in Portside communities.</p>
M36	Mike Bullock		<p>I want to thank you again for the redirection of SANDAG compared to the past, and I do support the 5 Big Moves. Now as I heard that presentation, I am concerned about whether we will meet our 2030</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

			climate stabilizing target and our other vehicle miles traveled reduction responsibilities. I didn't hear hardly any comments about that. I did notice that Ray Major did talk about behavioral change from pricing, but that's really all I heard and I think there needs to be information about how much we're reducing vehicle miles traveled with these projects, and I just point out that earlier people were talking about one or two cents a mile. Ten cents a mile going 10 miles, that would be 43 miles a month and parking downtown can be worth \$350 a month and at the county building it's free.	levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. The proposed 2021 Regional Plan would provide travelers with more travel and mobility options in residential and employment centers that can lead to a reduction in vehicle miles travelled (VMT).
M37	Mike Townsend	Mid-City CAN	I'm with Mid-City CAN, and I am a student and transit rider. I ask you to support no-cost transit passes for all youth ages 24 and under in our region. We need the RTP to commit to implementing youth-opportunity passes as early as 2022 or as soon as funding becomes available. Avoid a delayed implementation. This is a crucial part of COVID-19 recovery and youth living in the San Diego community today need youth-opportunity passes to connect with school, work, internships, and other opportunities. As a student who often relied on public transportation to get to school, I understand first-hand the impact that transportation fees have on students. Similar programs exist with great success in Alameda County, Boston, San Francisco, and most recently Sacramento and Los Angeles. We know it works. Please include the immediate implementation of youth-opportunity passes in the 2050 Regional Transportation Plan.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M38	Mohammed Tuama	Newcomers Support and Development	I am with the Newcomers Support and Development. I would like to say that I'm working with newcomers and most newcomers are coming from active transportation countries, active transportation systems, and their voice were included in this plan. I would like to thank Hasan, Coleen, and Jane Clough, and Nile Sisters for making sure that newcomers from various languages were included and were listened to when this plan was made.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
M39	Naomi Sanchez		I'm a resident raised here in Barrio Logan, a medical assistant, a promoter for Barrio Logan with the environmental health coalition and entrepreneur. I believe everyone deserves the dignity of having a clean and safe way to get around. If we compare our bus stops to the ones in other places such as Point Loma and La Jolla there are noticeable differences. Bus stops over there have lighting, they are maintained to meet public cleaning list requirements and over there you even see people using the seating provided. Here people stand because they don't want to sit in a dirty space and honestly who would. Environmental Justice communities are transit dependent. We use it the most and yet we get the least funding. Our community already lives right next to highways and industrial areas which produce high amounts of pollutions that we have to deal with. Please prioritize environmental justice communities in the Regional Transportation Plan.	We currently have a process and methodology for the prioritization of projects located in Appendix A of the proposed final 2021 Regional Plan. However, we also understand the sensitive nature that environmental injustices present to historically underserved communities, and other vulnerable populations. It is for this reason SANDAG is currently allocating funding for an equity focused pilot and other initiative programs.  Appendix H includes the social equity analysis for the 2021 Regional Plan.
M40	Noah Harris	Climate Action Campaign	I am with Climate Action Campaign. Thanks to the staff for today's presentation, we're encouraged by SANDAG's bold vision as outlined through the draft Plan. We urge you to prioritize investments in the communities on the front lines of environmental injustice and the climate crisis and as the plan is finalized to center the voices of transit dependent riders. Transportation accounts for almost half of emissions more than any other sector in the region. This draft Plan will achieve a 20% reduction by 2035 which is a great start, but to achieve zero carbon as climate science says is necessary we urge you to exceed our state mandated emissions reduction targets. Next we want to make sure that the plan will help the city of San Diego Achieve its climate action plan mode share targets for biking walking and transit and we'd like to see specific mode shift projections for the city to be able to track progress our goals. Finally please make sure to include youth opportunity passes at no cost transit passes for youth 24 and under the plan.	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan. SANDAG continues to work closely with all of it's member agencies, including the City of San Diego, to help provide the best available data in support of their individual targets and goals.  Regarding youth opportunity passes: One of the Implementation Actions listed in Appendix B will be a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M41	Phillip Petrie	Interfaith Coalition for Earth Justice	I am the acting coordinator of the interfaith coalition for earth justice. We are a coalition of San Diego Faith leaders concerned bout all aspects of eco-justice . Thank you very much for the time to speak this morning. I am really heartened by the national trend to put equity at the front of all policy decisions, but this must not be just talk. As a Christian, I believe God has a special concern for all the poor, for all those marginalized by society which is summed up in Jesus' statement, the last shall be first and the first last. So I ask to keep the members of SANDAG, those here and those who are not here, to keep the needs of San Diego's frontline community foremost in your minds when moving forward with our Regional Transportation Plan.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
M42	Rosina Lisagara		<p>Soy bilingue pero ahora me voy a comentar en en espanol en apoyar la equidad social. Soy Rosina Lisagara residente por mas de 23 anos, activista, lider y embajadora de comunidades saludable, como Cichinista y Coronado y otras lugares en National City. Una comunidad caminable y diversa con cultura, con conitos cruza fronteras que usara la transporte publico...[inaudible]...Pero que hay tanto disparidad para nuestra jente tanto trabajadora. Sigumos lo mismo problemas de salud, contaminacion, por anos a unos datos....[inaudible]... y CDC. Nececitamos rapido ..[inaudible]... y polices locales donde personas viven y trajaben.</p> <p>***</p> <p>I am bilingual, but I would like to comment in Spanish to support social equity. My name is Rosina Lisagara, I have been a resident for more than 23 years and I am an activist, a leader, and an ambassador of healthy communities in “Cichinista”, Coronado and other areas of National City. A walkable and culturally diverse community, with border crossings and that uses public transportation...[inaudible]... but there is so much disparity for our working people. We have the same health issues, pollution for years and data [inaudible] and the CDC. We need quick...[inaudible]... and local policies where people live and work.</p>	<p>Un componente esencial de la evaluación de los impactos del Plan Regional 2021 es analizar sus efectos para los grupos históricamente desfavorecidos y sistémicamente marginados. Esta evaluación se conoce como el análisis de equidad social y se enfoca en las comunidades de color, en los residentes de bajos ingresos y en los adultos mayores. Aunque el Plan Regional 2021 propone mejoras para toda la región, esta evaluación se asegura de que los beneficios sean compartidos por todos y de que la carga generada por los cambios que implemente el Plan Regional 2021 no afecten desproporcionadamente a ninguna de las poblaciones que son el enfoque de la equidad social. El Proyecto de Ley de la Asamblea 805 requiere que SANDAG identifique a las comunidades desfavorecidas descritas en la Sección 39711 del Código de Salud y Seguridad e incluye estrategias de transporte para reducir la exposición a la contaminación de estas comunidades. Una lista detallada de las estrategias de transporte, incluyendo los proyectos, las políticas y los programas que reducen la exposición a la contaminación de estas comunidades, aparece en el Anexo A del Plan Regional 2021 final propuesto.</p> <p>***</p> <p>A critical component of reviewing the impacts of the 2021 Regional Plan is evaluating the effects on historically underserved and systemically marginalized groups. This evaluation is known as a social equity analysis and focuses on communities of color, residents with low incomes, and seniors. While the 2021 Regional Plan delivers improvements to the entire region, this review ensures that the benefits are shared by everyone and that the burdens of the 2021 Regional Plan’s changes are not disproportionately shouldered by any social equity focus population. Assembly Bill 805 requires that SANDAG identify disadvantaged communities as designated pursuant to Section 39711 of the Health and Safety Code and include transportation strategies to reduce pollution exposure in these communities. A detailed list of the transportation strategies, including projects, policies, and programs, that reduce pollution exposure in these communities is included in Appendix A, Attachment 2 of the proposed final 2021 Regional Plan.</p>
M43	Sean-Keoni Ellis	UA Plumbers and Steamfitters Local 230	<p>I represent the members of UA Plumbers and Steamfitters Local 230. Thanks to all of you and the enormous amount of work that’s gone into developing a very promising Regional Transportation Plan. We think it’s past time San Diego has a transportation system that gives some practical, usable and cost-effective alternatives to driving and that’s what this RTP process. It will be a huge benefit to the workers and students making their daily commutes to school and workplaces. It will take cars off the highways, which will reduce greenhouse gas emissions, while also decreasing traffic for the folks that need to still drive their cars. We are also pretty excited about the thousands of good paying jobs that will be created right here in San Diego County. Hopefully jobs that will go to the very San Diegans whose taxpayers are paying for these projects. We’re hoping to get an opportunity to partner with all of you in the building of the transportation system of the future for all of us here in San Diego.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
M44	Stephanie Hernandez	City Heights CDC	<p>I’m a twenty-six-years-old native San Diegan who was born and raised in southeast, a lower-income community located between the four major freeways in central San Diego. For 10 out of 12 school age years I rode the bus and spent approximately 2700 hours on the bus so I could get from southeast to Point Loma to attend school. My parents could not drive me since they worked 15 hour days. I tell you my story because unfortunately my experience is not uncommon. As a staff member at City Heights CDC I hear the same challenges that I went through growing up such as one-way two-hour bus and trolley rides. Therefore, I’m calling you today to say that we’re excited to have worked with SANDAG staff as part of the Social Equity Working Group and now that the 2021 Regional Plan gets us closer to creating an equitable transportation system. However, we must ensure that the plan prioritizes communities like the one I grew up and still live in. Invest in me and in the future generation of transit riders who are hungry for opportunity and are in need of a transformative transportation system.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.</p>
M45	Sylvia Calzada		<p>I am a resident of National City, a neighborhood to the port of San Diego who has used transportation throughout my lifetime. From a college student to a worker. Customers using the blue line trolley has increasingly grown in the last few years. The demand exceeds supply. Please upgrade the need of the clientele in the blue line, from more services including the 24-hour service for people who work and attend college during night shifts to health and safety measures. I have never forgotten the day I was assaulted in the parking lot of the trolley station coming from a night shift working at Hallmark. I cried</p>	<p>We are deeply sorry to hear what happened to you at the transit station. SANDAG, MTS, and NCTD are taking steps to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			on my way home, feeling anger, ashamed and humiliated. It was a personal attack to my persona and it's not acceptable. Please support these important elements in the Regional Transportation Plan.	
M46	Tom Lemon	San Diego Building and Construction Trades Council	I'm with the San Diego Building and Construction Trades Council representing 35,000 union construction workers that have built San Diego. A big shout out to Hasan and his amazing team for this plan, this Regional Transportation Plan. Equity comes with the opportunity to get good jobs and having transportation that provides folks and opportunity to go to construction sites early in the morning and come home late at night is an amazing vision. We're looking forward to working with SANDAG on the future construction projects and creating opportunity for folks in impacted communities.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdforward.com">SDForward.com</a> .
M47	Toshi Ishihara		I'm a transportation justice advocate from Rancho Penasquito. Today I want to share my personal story about bathroom while taking transit. I'm getting older and I need to go to the bathroom very often. My wife also needs access to a clean bathroom with basic hygiene necessities such as soap and water. When I retired three years ago, I decided to take transit to go meetings such as this like SANDAG and MTS board meetings or baseball games at PETCO Park. However, I found most of the tourist stations and transit hubs in San Diego don't have any restrooms. So I had to drive around and find those restrooms available for the public. SANDAG is envisioning a world-class system of transportation. How can any true reward system of transportation can be complete without easily accessible, clean restrooms. Please make sure restrooms are included in your plan.	The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.
M48	Victor Diaz		I am a proud Southwest Union carpenter, born and raised in the beautiful city west of San Diego. San Diego needs infrastructure. Infrastructure built by skilled and trained workforce. A workforce that builds safety and productivity. I am in strong support of the regional plan.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdforward.com">SDForward.com</a> .
<b>June 15, 2021 – North County Coastal Open House</b>				
M49	Karl Aldinger		Hi, folks. I just wanted to give thanks to everybody that came out tonight to give the presentation. I think a lot of us are gonna take some time to read through the draft so it's too early for me to weigh in on what I've seen in the draft so far, but we really appreciate all the efforts that staff at SANDAG have put together. We are looking forward to these big changes and the 5 Big Moves. We will be giving more comment in the future and thanks again for everyone for putting on this presentation tonight. We appreciate the attention that you're giving to North County. It sometimes does feel a bit more rural and spread out, so we appreciate all the efforts there. Thank you.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdforward.com">SDForward.com</a> .
M50	Miguel Aguirre		Hello, everybody. I didn't realize I had my hand raised. I was listening while I was engaged in another activity, but it sounds great. I look forward to seeing the other presentations, and I would, I guess, take this opportunity. I really wasn't prepared to speak, but take this opportunity to remind everybody that we are part of a binational region, and the economic considerations should be integrated into the planning of our region. When we look at our location in North America, of course we are a strategic Pacific Rim of the border with Mexico, and I think that really presents a lot of wonderful opportunities to highlight our region and to plan a competitive mobility plan that is attractive to visitors and to investors in our region. I would also like to take the opportunity to point out that the World Design Capital Organization is entertaining a San Diego-Tijuana World Design Capital 2024 bid that will highlight design as an element for planning our economy, our social structure, and our development. So there's a lot of great things going on in our region, and I'm excited to be participating in the final draft of the Regional Transportation Plan. I look forward to participating and providing comments. Again, I wasn't prepared to speak. I was going to listen, but I'm looking forward to hearing other people comment. Thank you very much.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdforward.com">SDForward.com</a> .
<b>June 16, 2021 – County Unincorporated Open House</b>				
M51	Ricky Williams		I'm with the County of San Diego. I want to say thank you to you all for all the hard work that went into the creation of this plan. As was shown on the slide, there is a lot of information in this, and it's all excellent stuff. I have three questions I wanted to ask tonight. The first being within the RTP, we identified that there are roadway pricing and fees that are included in some of the future implementation. I wanted to ask a bit more of how these funds raised from these proposed user fees would be allocated amongst the jurisdictions and what types of projects the funds would be used for.	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
				program that will ensure that no particular group are disproportionately burdened and exploring mechanisms such as caps and rebates to ensure a fair system.
M52	Ricky Williams		Second is I would like to hear a bit more about flexible fleets. I know there's a variety of mobility options identified for flexible fleets, and I'm curious which options are envisioned for deployment in the unincorporated areas and along these rural corridors.	The 2021 Regional Plan envisions the deployment of Flexible Fleet services to complement investments in transit, mobility hubs, and complete corridors. Flexible Fleets can range from bikes and scooters to autonomous shuttles, increasing the number of mobility choices for residents and visitors to use. In the unincorporated County, Flexible Fleets like shared, electric, and eventually autonomous shuttles would be available on-demand, ready to take you where you need to go. Today, services like on-demand rideshare, microtransit, and vanpool already provide a convenient travel option in areas where traditional fixed transit may not work well.
M53	Ricky Williams		Finally, I'm curious to know what types of investments would be included along the complete corridors. I know you went over a lot of the safety investments, but in terms of technology improvements related to electric vehicles or other, what we would say, GHG-reducing activities are envisioned along these corridors. That is my comment.	The complete corridors assumes technology improvements related to both arterials within cities and within the highway system. Within city roadways, Smart Intersection System enhancements are planned to make those corridors more efficient and to decrease delay. On the highway system, dynamic lane management is anticipated and invested in to ensure that all lanes can be managed effectively and prioritize emergency services and transit on those corridors. The Regional Plan also includes incentives for EV charging stations and EVs.
<b>June 22, 2021 – South County Open House</b>				
M54	Carolina Martinez	Environmental Health Coalition	I'm with the Environmental Health Coalition and the San Diego Transportation Equity Working Group. We thank the staff for the presentation and all the work that has gone to make this happen, especially all the intention to collaborate with us to ensure the environmental justice communities have immediate solutions. I wanted to bring up two points. One of them is that the plan looks very exciting, and we support it. We support a vision to transform the transportation system in the region. We appreciate the naming and recognition that our transit system doesn't work. So because it needs a huge makeover, it's going to take a lot of time and years that have been missed, a lot of opportunities that have been missed. So our communities cannot continue to wait for solutions so we are asking that while the long-term solutions are important, like the Purple Line and we support strongly, that our communities especially in the South Bay, communities like City Heights need immediate solutions. They are hurting right now, and they've been hurting, and they cannot afford to continue to hurt. So how could the Regional Transportation Plan implement solutions like a bus system that provides connectivity immediately and so that they could then wait for the Purple Line? How could the youth opportunity pass happen immediately so our young ones could ride transit for free rather than waiting many more years before they could actually access the system? So what are the solutions that could be implemented right now so that they could connect to jobs now and not 10 years from now? So that is something we are asking and we are urging the Regional Transportation Plan to include. The last thing is that the Blue Line unfortunately as we see it in the Regional Transportation Plan doesn't reflect an investment into the future. The Blue Line is the line that is most used by riders currently. It's the backbone of our transit system. It connects us to the border. However, the Regional Transportation Plan does not demonstrate that it will be taken into the future into the next 30 years. How does the infrastructure improve so that the Blue Line actually creates more connectivity, because right now it is not meeting the needs of our communities? So we are asking that a consideration for Blue Line Express be included as part of the Regional Transportation Plan.	The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B). One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M55	Flavio Olivieri		I am a Chula Vista resident. My perspective is that the whole plan, it considers alleviating the transit situation for an existing employment and economic situation, and it is not really considering changes and evolution of the economy and labor centers. If you look at the trends in terms of new employment opportunities and the type of workforce that is required, we have to consider an economic development plan together with the transportation plan. So there is a very large investment tied to this transportation plan to serve a current employment structure. I mean, the whole plan continues to be fixed in the same static employment and economic structure. I don't think it is looking into the future of how those changes would be, and instead of looking up into how to develop more distributed employment centers and economic development hubs, it is focused on, here and into 30 years, into servicing existing employment and economic centers. I think there should be a more	The 2021 Regional Plan considers existing employment centers, commercial development that is in progress, and telework policies that influence commute patterns. As SANDAG develops the next Regional Plan, it will consider new trends and policies that may influence employment centers and commute patterns.

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			strategic economic development component tied to this large investment and developing economic hubs more distributed throughout the county.	
M56	Martin M		Thank you for the presentation. The one thing that I am concerned of is that there seems to be three legs of this plan, but it seems like it is primarily driven by the need, desire to meet mandates for climate change mitigation. I think that a better solution for the people would exist if it wasn't the primary focus. Now one of the things that I have concerns about as a scientist who studied climatology before it was called that is that the human-caused greenhouse gases that would be saved if indeed everything in weather and climate is by that one factor very insignificant, if anything at all. I believe that we are trying to fit the other two parts into something that has the mandates. I understand that the region has to meet state mandates, but I have concerns that those mandates aren't feasible, and they aren't in reality. The one thing that I do have to take umbrage with is when CO2 and greenhouse gases are called a health issue, and strictly speaking CO2 is not a pollutant, but I do know that we do need to have a better overall transit situation. I am supporting that, but I think it has to include everything, which includes the fact that people do need cars, people who visit the area and vacation here, and this is a very important part of the San Diego economy. They need their cars to travel, and they are not going to take buses and transit to the beaches and to the hotels. I think we need something that is more inclusive. I think it is just overall skewed toward meeting climate mandates, which I don't believe are all valid.	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The process for developing the transportation network considered many factors, including trips made by residents and visitors to the region. The transit system will be a compelling alternative to driving for many trips, while still allowing for a roadway system that supports people that need to drive.
M57	Miguel Aguirre	Grand Central West LLC	I am a managing member of Grand Central West LLC. We own the McDonald's Trolley Station, a private national gateway landmark located at the Port of Entry in San Ysidro. It is the heart of the San Ysidro Transit Center, also known as the San Ysidro ITC. Thank you for holding this South County Open House on SANDAG's Regional Plan update. As a born-and-raised San Diegan border crosser, my public comments are aimed at calling our mobility dynamic what it is: a binational corridor. Socioeconomically speaking, we are not an island separated from Baja or even Los Angeles or Riverside counties. The back-and-forth traffic between the Californias is more than evident. What is not evident, however, is what future we are planning for as a binational region. Repeatedly referring to the San Ysidro ITC as the number two station in the region is misleading. Number two to what? A one-day-in-the-future, maybe 20 years from now, \$5 billion Central Hub Project? I'm not sure what this narrative is all about. Is San Ysidro today the highest volume station by far in our region or not? No disrespect is intended for the Central Hub Project. On the contrary, it is definitely needed; however, calling our national gateway, the world's busiest border crossing, number two to something that doesn't even exist leaves much cross-border vision to be desired. Recent documents report how California's population has declined two years in a row for the first time in our history, how San Diego's home prices surge with limited affordable housing in sight and how SANDAG's previous 4.5 million population forecast by 2050 has been drastically reduced to 3.7 million. A recent San Diego regional EDC article on inclusive growth forecasts by the year 2028 we will have a shortage of 10,000 workers and how these challenges will make San Diego an unattractive place to live and do business. Big question: where will all the workers supporting our growing economy come from? SANDAG must tackle such issues strategically and that is a national need. The U.S. needs Mexico to be competitive with China and that is why we must address cross-border stigmas and focus on bridging disparities. It is time we have a reality check and call what we are planning for what it is: a dynamic binational region and corridor. North American leaders are seeking solutions which have been embedded in our own backyards all along. Thanks again for all your hard work and in sponsoring this public comment open house.	Appendix J of the 2021 Regional Plan includes information on SANDAG's approach to planning within the context of the California-Baja California binational megaregion and the importance of strategies that leverage binational and interregional partnerships to advance regional goals related to environmental, economic, and quality of life. Included in the Appendix A list of proposed projects is the San Ysidro Mobility Hub, which will facilitate and improve mobility for these critical crossborder and interregional flows. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
M58	Randy Torres-Van Vleck	BikeWalk Chula Vista	Congrats to SANDAG staff on the launch of the Regional Plan Draft. My name is Randy Torres-Van Vleck. I grew up in the Castle Park neighborhood of Chula Vista. I am a member of BikeWalk Chula Vista and the San Diego Train Station Equity Working Group. This is a really big moment for our region, a critical milestone for planning what's needed to improve the quality of life from a train station perspective, land-use perspective, air quality perspective. This is really important work and congrats again to the staff. I am most excited about the South Bay to Sorrento Purple Line Alignment. That project will connect our South Bay communities, South East, Mission Valley, Sorrento Valley. Looking forward to expanding the Rapid Network in the near term. As Carolina from the Environmental Health Coalition mentioned, it is important that we make those near-term investments to make sure that communities that are riding transit now can get to where they need to go and that we have late night/ 24-hour service. That was ranked as the highest priority in the MTS' elevate process so that's	The planned transit frequency improvements and spans of services for all routes, including existing local service and future regional services, will be added to Appendix A for the proposed Final Plan and can be currently viewed as part of the Social Equity Working Group agenda from August 5, 2021. SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (to be included in Appendix B). The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.  One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study.

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			something that is going to be critical as well. The third track for the Blue Line is going to allow for 24-hour service and greater frequencies and express service, and that is something that I support. Creating a dignified transit riding experience is super important, and that could be done through bathrooms. That's one element of a complete transit system, having bathrooms so riders can ride with dignity. That is something that we need to see more of in the plan, I believe. The plan does call for some affordable fare subsidies like the Youth Opportunity Passes, so that's something that I'm definitely excited to see. I was happy to hear about the Rapid Bus Network from Southwestern College to Western Chula Vista. That is definitely needed, and mobility of Southwestern College is going to be really key. Finally, happy to hear about the lane conversions. I want to express my support for those. We need to be more efficient with how we use all the freeway space that we go decades throughout decades. We can't be adding more lanes to the freeway so looking at the conversions is going to be important. Thank you all for your time. Looking forward to working with SANDAG, community members on the next steps to get the plan approved but also make the necessary tweaks to it that advance equity for South Bay communities.	This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.
M59	Rocina Lizarraga		I am a National City resident, and the reason that I wanted to speak today is to thank you to SANDAG for this opportunity to provide this input outlet for us as residents. I have been in National City for a long time, and also I have initiatives of public transportation. I primarily collect direct info from residents here in the area. The feedback portion of this Regional Transportation Plan does not reflect, in my opinion, a short-term benefit for this plan. There are a lot of necessities among our senior population. Our core residents, especially the seniors, are struggling everyday with mobility problems and a sense of safety. This struggle every day for people like the senior population that struggle everyday with mobility and physiological necessities because as we grow older we have more necessities. We want to see that included on the plan. I haven't seen it. These people, specifically that target population, have struggles every day when they use public transit. Neither the presentation or that has been said, and also how the plan is going to be impacting this type of population. I wish to see more of those necessities reflected on the plan. It should be addressed and have its own period.	The 2021 Regional Plan aims to improve access to a quality public transportation system for all San Diego residents, especially for seniors, historically underserved communities, other under-represented populations. Our social equity analysis projects significant improvements for senior access to high-quality transit service, parks, and recreational facilities. In every metric senior access to transit, retail, medical facilities, and parks improves through 2025 and 2050. More data and analysis is available in Appendix H of the 2021 Regional Plan.
<b>June 24, 2021 – East County Open House</b>				
M60	Councilmember Jack Shu	City of La Mesa	Thank you SANDAG staff to Larry, Alex, and Hope for having this workshop, and of course my colleague Mayor Vazquez. I'm very thankful that you're having this workshop for East County and all that this plan may offer those of us in this county that's really looking forward to a much better transportation system to relieve some of our congestion issues as well as help us meet our greenhouse gas reduction goals and reduce pollution in our communities. I have a quick question, and I'm only doing this of course seeing that we seem to have some time with not having other people asking questions. So Alex, when you presented the high-speed commuter rail system as well as the rapid bus systems, would it be possible for you to give me a quick example or maybe a time element as to what those services will do for those people commuting east-west or west-east with if those were put in place? So for example, if someone is traveling from El Cajon or even La Mesa going to downtown or some other part of the region, if we have those systems in place, what would do to their commute time compared to driving and probably driving and doing rush hour with congestion? What would be a comparison in terms of time and cost?	<p>With the 2021 Regional Plan, SANDAG plans to reduce the region's greenhouse emissions while also providing travel options. For these envisioned Transit Leap services, we want to provide competitive travel options for folks traveling to downtown and throughout the region. The way to do that is by providing fast, reliable, and frequent service. In combination with Flexible Fleet services, new travel options should be more competitive than driving alone.</p> <p>Travel times definitely will be increased if we do nothing. In this plan, we're going to, at a minimum, make sure that people are going faster than what they can do today while reducing greenhouse gas emissions and reducing vehicle miles traveled. Appendix T has more detail about travel time in each of the corridors.</p>
M61	Don		What changes has Hasan Ikhata done with SANDAG's grant writing group to increase the number of federal grant dollars that come into San Diego to bring them up to par with what he was able to bring in in Los Angeles?	Since Hasan Ikhata came to SANDAG, a new Grants Division has been formed to centralize grant application efforts at the agency. This staff is focused on searching for and tracking all grant opportunities SANDAG is eligible for and then providing that information to staff at SANDAG and its member agencies so that we can all coordinate on application efforts in the region. Experts in drafting grant applications have been identified to assist staff in preparing application materials to ensure higher success rates on grant applications. In addition, a new "Pursue Funding" initiative was adopted by the SANDAG Board in June 2021 and staff have set performance measures to track progress on grant applications.
M62	Don Wood		I want to thank SANDAG for doing a different sort of planning this round of the RTP. It's, it's refreshing to see SANDAG is changing its style a bit and is certainly more honest and forthcoming about the dollars involved, what the dollars can do. Hopefully SANDAG won't fall back into its old habits of promising more and delivering less, given that the shabby track record has had the last round of RTP	Thank you for your comments and support for the 2021 Regional Plan. SANDAG will continue to be transparent in this process through public and stakeholder engagement as we begin efforts to implement this plan.

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			so hopefully you will keep going straight ahead and start putting some more bones on this, on this frame you're putting together. I think we need more details as we go, certainly details that will convince customers or users of SANDAG and MTS facilities that it is worth their vote to help fund the improvement that you envision. Thank you.	
M63	Savannah O'Toole	SA-SEJ	I am an SA-SEJ fellow, an organizer with SD350. Thank you for your time. I would just like to add a few things, a few comments on your for tonight. So we would like environmental justice to be embedded in San Diego so therefore we're asking for 10 different changes to be included in the 2021 Regional Transportation Plan. We call for an environmental justice-centered RTP that will ensure the projects included in the RTP will prioritize environmental justice communities identified by the CalEnviroScreen, which is abbreviated CES which by listing projects that will directly benefit environmental justice communities by outlining immediate benefits via projects that will be implemented by 2025 and making all public communication easy to understand by the public in order to promote meaningful engagement. So therefore in the RTP we ask that the, that an equity-specific project list be included in an Appendix A for transportation projects, programs, and phasing document. I call for an improvement in the bus system now that is fast, frequent, reliable, and accessible through increasing frequency on popular lines, especially the overcrowded ones. So therefore I call for more clarity in Appendix A: Transportation Projects, Programs, and Phasing that provides a list of specific and provide improvements to this business system. I call for increased funding for the planning, environmental review, engineering, and capital for the additional Blue Line track that allows 24-hour service and additional frequency enhancements. The information for the Blue Line needs to be more clarified, needs to be clarified. It's currently unclear if the double slash third track included in Appendix A refers to an additional track that will be provided express kind of with, that will provide express connectivity from the border to downtown San Diego. I call for a 24-hour service by 2025 on popular transit routes that to connect late night to early morning workers to their jobs. Therefore, the information in the RTP needs to be clarified. The language in both Appendix A and Chapter 2 should specifically call for the 24-hour service on popular transit routes and present a clear implementation schedule. I call for the funding, planning, environmental review, engineering, and capital for the Purple Line as a rail that connects environmental justice communities in central, central City Heights, and South Bay to Sorrento Valley. According to SANDAG staff, the alignment includes City Heights in the 2050 RTP with a 2035 implementation; however, it should be listed in the document to demonstrate that project phasing prioritizes central City Heights in the South Bay region and a 2035 completion.	The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.
M64	Savannah O'Toole	SA-SEJ	I call for a no-cost transit pass for all youth of 25 or 24 years old or under in order to ensure generations of lifelong transit riders, encourage significant mode shift. Further, I ask that it be accelerated for a 2035 implementation instead of the current delayed plan to be implemented in 2027.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.
M65	Savannah O'Toole	SA-SEJ	So and I call for an electrified bus fleet by 2030. Fund the implementation of California's innovative clean transit rule to accelerate the electrification of the bus fleet 10 years before mandated by the California Air Resources Board. We cannot afford to wait 20 years to reduce our greenhouse gases, and therefore I ask the transition to zero-emission buses be accelerated for a 2030 completion with the support of recently approved state and federal funding sources.	The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a> .
M66	Savannah O'Toole	SA-SEJ	I call for funding to protect vulnerable communities living near transit corridors by anti-displacement efforts. Developing an anti-displacement strategy that includes affordable and low-income housing and preservation of the naturally occurring and existing affordable housing community ownership and tenant protections. Therefore, I request an update on the status of the anti-displacement study.	Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
				housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.
M67	Savannah O'Toole	SA-SEJ	I call for the development of a bathroom access plan and providing MTS with funding for a clear and accessible bathroom network open at all major transportation stations. It's unclear if a bathroom network is included in the capital operations budgets[...]	The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.
M68	Savannah O'Toole	SA-SEJ	[...]and I lastly call for the funding in of the planning and implementation of a transit emergency response strategy to provide safety particularly to environmental justice communities during the community-wide emergencies, which currently is not included in the RTP. Thank you very much.	MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG's specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.
<b>June 28, 2021 – North County Inland Open House</b>				
M69	Alex Wong		Of course you know though I live out of state right now you know my family is in Rancho Bernardo, and I'm super passionate about transportation in general and just about San Diego geography. So to be honest you know I like some things about the SD Forward Plan, you know the managed lanes to kind of tour lanes, but I'm not, I'm rather a skeptic you know. Personally I'm a bit of a skeptic on rail transit right but if you're going to be building rail transit right but if you're going to be building rail transit I believe you have to convince kind of fiscally conservative suburbanites like me right. We look at the ridership statistics pre-COVID, even the San Diego Trolley was only carrying 120,000 people a day, and I think it's really important to improve existing capability, existing capacity on the San Diego Trolley and prove that it's actually you know moving a pretty big proportion of the inner city population, and it's actually taking cars off the road. So that's why I'm just a bit wary of you know maybe building these commuter rail lines that go all the way into the suburbs because you know if I don't really see a lot of people in inner city using it then I might be a bit skeptical of you know how many people are really going to use it if you extent it into the suburbs if it's simple a some, somewhat faster version of the coaster. So that's why I believe that's the first rail line that you should build if you do build a rail line should be focused on the inner city like maybe a mid, a mid-city trolley that goes from downtown, connects to SDSU and kind of passes through Balboa Park, and a mid-city. I think it's a very dense corridor and you know, it's a lot of low-income people who could really benefit from it, and if you get that right, if you manage actually to attract a lot of riders right, build this high quality rail line, attract a lot of riders then I think suburbanites might be more convinced. I think this is the first step in actually building a more extensive rail system if, if that's desirable and furthermore on the existing export, existing trolley system, I think it's crucial if you want to, if you want to increase ridership to make sure that you have decreased frequencies, and I have heard that you are trying to decrease frequencies on the blue line to five minutes. Five minutes frequencies, and that is a very good first step because I believe frequency is the number one factor in driving up ridership. Now I would like to ask is the proposed kind of commuter rail lines, are they electric? Because you know I would hope that they're electric to reduce these noise emissions. Yeah, that's just my question.	The first commuter rail line that is proposed to be implemented would operate between National City and Sorrento Valley serving the inner city communities of City Heights, Mid-City and Southeast San Diego. This line has the highest ridership potential. The existing system would all move to 10 minute frequency all day. Select routes like the Blue Line would continue to operate at 7.5 minute headways. Going to a five minute headway is difficult downtown due to cross street traffic. The type of vehicles and propulsion will be determined during the advanced planning phase of the project.
M70	Alex Wong		Once again I'd like to go over the real plan, and I kind of heard about the Purple Line right so I've heard about it before, but I don't know if you've heard of this guy called Alone Levy, he's a transit researcher, and he said that's the - he has an article in the Voice of San Diego- he said that the Purple Line is not such a good idea. Why is because it goes through a free freeway median, and he's saying that freeway medians are generally not very attractive because the stations are inaccessible, well generally don't once you live near freeway medians. So for example, he will say that and also that's the Purple Line is kind of circumferential. It doesn't actually take people to the downtown core. I'll take an example -	As part of the Regional Plan development, a new Purple Line alignment was developed that travels through the heart of our most dense communities and employment centers. This line will offer important connections that are not focused in the freeway median.
M71	Alex Wong		So I have looked at your plan, kind of looked at the transit leaps, and I do see what appears to be kind of a commuter rail corridor that kind of parallels I don't know University or El Cajon; however, you	The commuter rail route in the Regional Plan will go through a comprehensive alternatives analysis as part of advanced planning. During this time, a light rail alternative

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

			<p>know I previously mentioned that I believe that a mid a mid-city trolley would be fantastic because you know the busiest bus lines like the like the route the route 7 and the rapid 215, they pass through there. However, I strongly believe that this commuter rail corridor should instead be built as a trolley and why is that? Because if you build it as a commuter rail then I think stations will be further apart so so people will have to take the bus or take the or some ridesharing to get to the station right and it will be they will have to make more transfers. Yeah, so instead I think that maybe it would be better to have a trolley line with more stops in between and people can just walk to a neighborhood station and have a one-seat ride and walk and then walk to their destination. And also you know you might think that denser stop spacing, well maybe it would make it slower, but I'm I really believe that if you make it fully grade separated, you know elevated or underground, then it actually would be quite fast you know. I mean maybe at least 20 miles per hour in you know rush hour car traffic on roads like that probably only averages 12 miles per hour at best so that would easily be much faster than driving.</p> <p>[moderator response]</p> <p>Oh can I can I say can I say something here? Oh ok, yeah I do understand that but ok I think what I was meaning is that right on the map, I see a kind of commuter rail line that goes from I don't know downtown to SDSU, but I believe that that perhaps would be better built as a trolley line.</p>	<p>will be evaluated to determine which mode of service performs the best in the corridor. In the interim, Rapid service will improved in the corridor that will provide connections along Mid-City, City Heights and Downtown.</p>
M72	Alla Valedspino		<p>I'm a resident of the City of Vista, and I have been riding the public transit in North County for over 10 years; however, the loss of some bus lines near the Vista Civic Center has prevented me from being able to take transit and that's a shame because I know I'm not the only one. Transportation access for clients is a vital necessity and the lack of accessible transportation to individuals from low socioeconomic backgrounds is a major social determinant of health. Therefore, I suggest that SANDAG partner with community health centers so that patients have better access to health care. Another thing that I would like to add is that if SANDAG, MTS, and CCD wish to see higher ridership, there has to be a stronger effort to advertise public transportation to those that regularly drive a car and also advertise like popular destinations. In addition, SANDAG and local governments need to consider the reality that building luxury housing near public transit will not increase ridership even though they advertise it as such; rather, it will decrease because these people can afford to have a car. If SANDAG wants to have more ridership, they need to have affordable housing built in your mobility hubs in public transit, which I know is something that you have mentioned today so that's a very good thing to hear. Overall, I am in support of the 5 Big Moves, and I'm especially interested to see what those flexible fleets would look like here. The next OS sounds interesting as well, and I hope that through the app there is a way to review the system so that SANDAG has real-time feedback on their bus line routes and schedules. That way they can make adjustments if necessary.</p>	<p>SANDAG partners extensively with Community Based Organizations to outreach to a variety of groups that utilize transit or have a role in getting people around the regions. In North County, SANDAG works with four different groups that cover Vista, San Marcos, Escondido, and Oceanside. With regard to affordable housing and mobility hubs, SANDAG will be working closely with jurisdictions across the region to ensure that a wide mix of housing types are providing close to transit.</p>
M73	Craig Jones		<p>I'm just interested to hear more about the difference between connectors and managed lane connectors on the maps that have been shown. How are they different from each other? What do each of them connect or unconnect? Thank you.</p> <p>[moderator response]</p> <p>So I think so. So I know what managed lane connectors are, that you can go seamlessly from one set of managed lanes to another, and the regular connectors are points where modes come together?</p> <p>[moderator response]</p> <p>Got it. It's, it's another version of roadway improvement. Okay, I got it.</p>	<p>Connectors are facilities that connect two intersecting freeways or highways. Managed Lane Connectors specifically connect Managed Lanes, and direct access ramps allow buses, carpools, vanpools, and motorcycles along with emergency vehicles and low-emission vehicles with appropriate decals to access the Managed Lanes in the center of the freeway. You can find more information about the application of each facility type in Appendix A.</p>
M74	Craig Jones		<p>I really appreciate this is a dialogue rather than a presentation so I think that's incredibly valuable. I should mention I am a member of SANDAG's Social Equity Working Group. I'm a representative to the body from the Alliance for Regional Solutions in North County, which represents the interests of underserved populations. So Alla's comment is incredibly on point. We're trying to look for as much equity as possible and with this I can't overemphasize how important flexible fleets is as an element of this. It's perhaps one of the least developed in detail in the proposed plan because it requires a level of local development and organization, implementation, but I encourage everybody to really support flexible fleets. It's going to be incredibly important. Including providing equity and transportation, so</p>	<p>Flexible Fleets will offer people a variety of on-demand shared vehicles. Flexible Fleet services may complement fixed-route services, even in more suburban communities. They offer additional convenience, as the on-demand nature of Flexible Fleet services allows people to book a ride almost anywhere and anytime. Proposed Clean Transportation policies will also ensure that Flexible Fleet vehicles transition to zero-emission vehicles to further meet air quality mandates. In addition, the Regional Plan proposes investments in active transportation and Vision Zero policies to create a safer environment for biking. These strategies combined will make it easier to drive around without driving a car.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			<p>much needed access for the underserved populations. One of the things that Alex Wong spoke about earlier, I agreed with what he said. He noted that those who are now skeptics of supporting this proposal might cite the relatively low ridership of the existing trolley, and I just wanted to observe that the reason for that is that we have a poor system right now, a poorly interconnected system. It doesn't compete with the automobile. What's promised with the 5 Big Moves is a coordinated integrated multimodal system that does compete with the automobile and that should make it work. I had a question. If there is time about the North County system of next rapid buses, if there's time could we go back and look at that map showing those? I want to know if it looked like some of the rapid bus, next gen rapid bus routes, were not using Highway 78, but other routes that might be more curvilinear. So I just wanted to know more about the-</p> <p>[moderator response]</p> <p>I just want to observe it before I retired from Monday through Friday employment. I was one of those who drove the entire route from Oceanside to Escondido, and I really hope there's a direct rapid bus route that makes that entire that entire connection that can compete with the automobile.</p>	The North County CMCP work is digging into the finer details of what is proposed in the Regional Plan and may propose additional Rapid Routes.
M75	E Aenelle		<p>I just wanted to first of all, I just came back from a short trip to Seattle, and I just wanted to tell you about my experience upon landing at the airport. I used a common application, Google Map, and they directed me to the most nice experience I had in public transportation in a while. I was directed to the light rail system, and I got on it. It took us right to downtown Seattle, but not only that. There were alternatives to the way to get there. You know, I could have it told me on how to walk how far to walk to the stop, if I wanted to switch to a bus, take a different route and so on and so forth. I had about three different ways of getting where I had to go so that was great and we need something like that. I live in North County, and I think the public transportation availability here is very limited. My sister had to go to four appointments, medical appointments, from Oceanside, and it was very difficult for her because she had some you know physical problems in getting around. So I think we need we need more variety and more ability to connect the multiple methods of getting around that's already been mentioned. They need to be all coordinated so that you know, one can hop, skip, and jump. I've had to give up jury assignments down at the county because of the transportation issue. So it affects us and more ways than you think, not just work so.</p>	The draft 2021 Regional Plan includes, as part of the 5 Big moves, Complete Corridors where multiple modes are accommodated and NextOS that can both inform the traveling public of options and dynamically manage lanes for improved efficiency. Additionally, access to the airport is addressed through a whole suite of transportation solutions identified the "Central Mobility Hub" corridor in Appendix A.
M76	Kevin Delmastro		<p>I really appreciate all this information. I'm really excited. Me and some neighbors here in Tierrasanta actually would love to just take a short trip over to Kearny Mesa and hop on either light rail or rapid bus or something. Get different places. I actually have a saxophone business, go downtown a lot for gigs so that would be great. Parking is limited in a lot of the popular areas so I think that's a big plus for the public transit and integrating technology and all the big moves you guys are talking about is really great. So I don't really have any questions. I just want to say bravo for trying to tackle this problem that San Diego has had for a while with limited transit.</p>	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> . The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.
M77	Kori Jensen		<p>I'm a member of the Oceanside City Council and first I'd like to thank you for holding these open houses on the Draft 2021 Regional Plan. I like, I'm sure other local elected officials view this plan as essential to our region's future, and I appreciate the initiative displayed by board members and senior staff to plan and hold these open houses regarding a specific issue. It is apparent to all of us that San Diego County and indeed our entire state faces a dramatic shortage of housing for virtually all income levels. Now there will effort to address the need for housing for those at lower income levels, but I do want to note the similar need for affordable housing and accessible middle market housing in San Diego County. Many cities in the county including my own are moving fast to address that market need, if we hope to attract and retain good paying middle and upper income jobs. We need to make sure the workforce finds available homes appealing and that's where we need SANDAG to be a partner with us by ensuring that transportation network of the near future supports the homes that will be built. The transit and road networks must be accessible to the new home communities that will come online in the next decade and beyond. I hope for the maximum possible communication between SANDAG and our local planning staff so that the transportation plan for the rest of the century matches San Diego's 21st Century housing supply.</p>	SANDAG recognizes the need for more affordable housing for people of middle to low incomes households that are near employment centers and a variety of transportation options. SANDAG is currently developing a Regional Housing Incentive Program that will consider climate change, climate resilience, and consistency with the transportation improvements and land use goals included in the 2021 Regional Plan.
M78	Mario Ingrassi		<p>I really want to see you guys build all this. I'm really enthusiastic. I've made comments before, I probably sound very pessimistic. I'm not pessimistic. I just want to make sure it works, but a couple little questions while you're in North County there. Well this is North County but how much are you</p>	The Blue Line Trolley will be speed up through an extensive network of grade separations along the line and a third track that could help bypass specific stations. SANDAG will also be partnering with MTS to complete a study on a Blue Line express option that could

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			<p>guys looking at possibly doing work on the existing trolleys to speed them up? Or on the Blue Line, there was a lot of talk about adding a third track so that you could have an express lane. Are any of those things still in the works or are they kind of like by the wayside? That's my first question.</p> <p>[moderator response]</p> <p>Yeah because I was when you said the speed up time it gets to Old Town, I thought you were talking about probably using the Purple Line, not speeding up the Blue Line that much, but how about just speeding it up enough so that it's faster? Because I know the trains can run pretty fast, much faster than they do. You know curves and safety, and I understand there's a lot there, but when I when this when the trolley started it yeah well I won't say definitely moved faster. It just seemed like it moved a lot faster and especially going through downtown right now the perception of how long it takes is really crazy. Let me ask a couple quick questions and -</p> <p>[moderator response]</p> <p>Well that's true, but I'd like to see you get the mayor, and I can't pronounce your boss's name together in a room and so to get them to tell their engineers fix the traffic signals and the trolley downtown because if they wanted to, they could do it but either each one keeps blaming the other one. Every time when I talk to engineers ""oh it's the city's problem. Oh no it's SANDAG's problem. Oh no it's MTS' problem."" If you guys told your engineers to do it, they could fix it because those trolleys didn't used to stop. When they when they opened up they stopped only at the troling stations. Speaking of I-5 and 78 and that connector, how about just making a regular connector there? When is that going to happen going from westbound to southbound? I'll be quiet.</p> <p>[moderator response]</p> <p>I mean that's been like that since I was a kid.</p>	<p>provide another set of rails that would allow for a true express service and potential 24 hour service. With regard to the downtown traffic signals, that is a component of Next OS and traffic signal progression will be evaluated on all of our corridors throughout the region.</p>
M79	Mario Ingrasci		<p>How about Mission Valley here? Quick on. Well it could be specific, maybe I could talk to somebody offline off later, but I'm wondering about the most information I can get out of UCSD as far as what they're doing with you guys and whatever is they think the best place for a train station is going east-west along parallel to the existing station. For the I'm talking about the Purple Line through there.</p> <p>[moderator response]</p> <p>Not UCSD, SDSU. Mission Valley. In order to make that work, that Purple Line, well got a bunch of questions here together. You've got a rapid bus now running through down 15 and then goes up to Kearny Mesa. Now I don't if the before the Purple Line comes through you want to have that going into the stadium or not. That's would be nice, but I don't think, I don't even know if that's what you're talking about. Anyways, when you get the Purple Line in there there, I would like to see something worked out for with you guys and I would like to see on paper because I can't get a, I know it's up in the air, you can't make them you know. It's too early, but that project is being constructed now so the sooner you guys come to a corridor in there the better, and if you if this is going to be a high-speed train you want going north and south, not going east and west, and they're talking about a station for the Purple Line being parallel to the existing green line, I guess that's there now yeah and that doesn't make a whole lot of sense. You're gonna be coming down and then go back up again. You should have an elevated train that goes right through the valley up in the air so it doesn't have to you know through even parallel to 15 would be better but in the middle of their project would be the best place for it. I know they don't want to do that exactly, but do you guys have any kind of, how do you negotiate with them?</p> <p>[moderator response]</p> <p>I think you should publicize that more so we all know what you're doing. SDSU won't say anything. They say ""oh that's in the works, we'll do it"" and then that's all they want to talk about.</p>	<p>SANDAG staff have worked closely with SDSU to ensure that a future transit station will be available when the Purple Line is in operation. SANDAG conducts reviews of all projects under development to ensure that when appropriate transit can be incorporated. The 2021 Regional Plan Appendix A and data viewer can be used to explore other projects in your area. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
M80	Mary Ann Horton		<p>I have attempted to use rapid transit from Poway, I live in Poway, to downtown when I can make the schedule work. It's a wonderful experience, and I would love to have been able to use it more. Unfortunately, it really hasn't worked out for me. I live in Poway, I used to work for SDG&amp;E before I retired in Mission Valley. Trying to make the schedules work on transit, it took two hours to get anywhere. The BRT won't stop in Mission Valley, and you pretty much have to drive. So what I'm seeing from North County Inland, which to me means the I-15 Corridor, the solutions that we've been presented are the managed lanes and the BRT. And the managed lanes I love, but they require you to drive and so you're putting out pollutants out there, and there's still that big bottleneck at 163 and 15 in the evenings when you're trying to merge that the managed lanes really aren't helping. The BRT would be much more useful if it could actually get people there in a reasonable amount of time. Takes two hours to get anywhere and if you're if you're going outside of commute times, they don't fun at all. So for example, if I wanted to go to a Padres game from Poway, I have to leave the Padres game by 6:30 p.m. in order to get home, or I'm going to get stuck overnight. This the scheduling really drastically needs to improve in order to make it useful. What I would am hoping to see and I haven't really seen much attention to this and maybe you can address it. I would love to see and may this is what you call flexible fleets. I would love to see an Uber-styled shared ride experience that you could use an app that would get you from point A to point B in a shared four-passenger, 10-passenger, 20-passenger vehicle from point A to point B in half an hour, door-to-door at a at a priced approaching what you spend for a commute. Five bucks in each way or whatever. I think with your next OS the modeling ought to be able to support getting some kind of sharing going that would get people efficiently from point A to point B, reduce the traffic on the freeways by having four or ten people on there instead of one person and allow errands to all kinds of point-to-point places that the main lines aren't going to support. I would love to see it if you would put more publicity and energy into that, and I would love to see more publicity and energy put into the I-15 corridor, north and south, to help people get there.</p>	<p>Transit and Flexible Fleets will work together to provide the experience that you've identified in your comment. It may be that one shared vehicle is used for the full trip or the trip is broken into two pieces with transit providing a portion of the trip. Next OS will be utilized to help passenger make those types of decisions. This type of trip could be applied throughout the San Diego region.</p>
M81	Maz Hadaegh		<p>I also live in or I live in the suburbs of San Diego, and I'm very supportive of the 5 Moves and my I'm generally you know any basically I'm supportive of anything that helps to for all the reasons that you stated. I think the mass transit plan would be my preference. Anything that favors or prioritizes high-speed rail, light rail, and etc. over you know lane expansion would be my preference, even if I personally don't end up using it, I see great benefit to the region, although I will, I will personally use it as well. My question is about the funding and sorry if it sounds a little naïve but how far into this 2050 plan have we already approved funding for and what remains to be approved and can you just comment a little bit about that process? Is it going to be done in phases? I imagine. And you know sort of what's the next funding target and what can we as residents in the region to do push our elected officials to make sure this happens? Obviously this is a very refreshing change from previous years, looking at the big picture, looking taking a very long view approach to our region's transportation. So thank you again for the presentation. I'll wait for your answer.</p>	<p>The Cost Estimation Methodology and Funding Strategies for the RTP were presented to the SANDAG Board of Directors on March 12, 2021, Item No. 8B. This report and presentation described the various funding assumptions developed for the draft 2021 Regional Plan and the time phases proposed. The entire Board meeting can be found at <a href="http://www.sandag.org">www.sandag.org</a>.</p>
M82	Maz Hadaegh		<p>My question, I think you had a slide about where the densest work areas are, and it was a little hard to read for me, but I believe you were probably pointing to the UTC area and Sorrento Valley area, if I'm not mistaken. What is the plan for to connect those two regions? Because currently as far as I know there is not an efficient way to get between those two areas. It's is there a light rail or any kind of rail or anything high speed planned?</p> <p>[moderator response]</p> <p>If you can leave your email address that would be really helpful.</p>	<p>The regional plan includes a Transit Leap commuter rail line that will connect UTC to Sorrento Mesa. The COASTER service along the LOSSAN rail corridor will also have station connections at UTC.</p>
M83	Mike Bullock		<p>Let me apologize because I do live close to the coast, and I had a conflict when you had your coastal meeting so here I am. I really support the 5 Big Moves. They, they really are big moves, and they're exactly what we need, and I appreciate the change from the previous regional transportation plans, which I think were off track, and this one is, is doing an awful lot of things very well. I, I just want to state that now one thing I miss is the, the transit leap that you put out quite a few months ago and maybe a year ago, I don't know. Included a, I believe it was probably a Sprinter line from Carlsbad Village to Vista Transit Center, and I thought that had a lot of potential, and I know you have to pick and choose, but I, I would love to see that that reconsidered, and I also think that it would be good to explain what the future might really look like in terms of managed lanes. That state has a draft plan</p>	<p>As we refined our planning analysis, the Sprinter line was truncated to Oceanside Transit Center because it had the highest ridership potential and there are two Next Generation Rapid routes and the Coaster that serve the Carlsbad Transit station. This allows for a comprehensive system of transit. As indicated in the comment, it is our intent to use Road User Charge to fund the operation of the transit system.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			<p>out now, it's a climate action plan, for transportation infrastructure called CAPTI, and it includes a road-use charge to replace the gas tax, and it is means based and we like to talk about equity. This really could produce equity. The gas tax is very inequitable. It definitely penalizes low-income drivers, but we do need full-cost pricing. I think that would go a long way towards explaining some of the misinformation that we've seen in the UTM about you know using funds from road use to fund some transit. You have to put that into context that we are heavily, heavily subsidizing driving, and that's inequitable right there, and it should be means-based, and the state is saying that and that would mean all lanes you know as soon as we get out of our driveways and start driving we are on managed lanes and that could prevent congestion because there are algorithms. I've written some myself because I'm interested in this topics to eliminate congestion. As the lane occupancy approaches some percent of 100 full, you immediately start adjusting your price, and you present you prevent congestion and of course somebody gets a stroke and needs to go to the hospital, you realize congestion is unacceptable, and it is a failure government, and government should stop failing there. So anyway, those are some of my comments.</p>	
M84	Mike Bullock		<p>The reason I raised my hand is because of the discussion about greenhouse gas, and you're right, that is my primary concern, and I think it needs to be everyone's primary concern because of the time urgency, and I don't hear that in the discussion that's going on and especially when you are saying that it's kind of hard to predict, and we'll do other regional transportation plans, and you were talking about regional transportation plan in four years, and you'd know better, and you know I just want to point out that what happened, what is happening in the northwest, and there's always things like this going on. Things that just are shocking you know. They're breaking all-time temperature records by record amounts, by 11 degrees. Unheard of temperatures in cities like Spokane and Seattle and that is not the scariest thing that's going on right now. The fact is there is a heat wave in the Russian permafrost which is going to be releasing methane gas and that is a feedback loop which could get so strong that it doesn't really matter what we do, and I think the discussion here seems to be in in awareness that cars are the biggest problem and that we have to reduce driving, and I would say that the climate scientists are telling us that we need to reduce our emissions to 80 percent below what we emitted in 1990 by 2030. You know and the state mandates are 2035 and they're only 40 percent down, and they need to be 80 percent 5 years sooner and so we have an emergency situation and I love all the rail, but that takes a lot of time. And I love the zoning improvements, but that's going to take a lot of time and what could we do that would could be done in just several years, and you've heard me say this over and over again. It is pricing. We have really bad systems to charge people to use roads. We have really bad systems to charge people to use parking. We think it's free parking, and it's absolutely not free at all, and it's not equitable. Craig Jones, my friend, always talks about equity, but I don't hear him concerned that people are working downtown for the county, and they're not driving and that and a parking space down there can earn \$350 a month. That \$350 a month should go to them, and then you have a lot more people that aren't driving and that path to get the system that has been defined by the plaintiffs in that Climate Action Plan lawsuit, that system needs to be talked about and implemented. There has to be a path shown that will make that happen soon. We're running out of time.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT.</p> <p>The 5 Big Moves will ensure connectivity and result in people having more travel options and operating solutions, reducing per capita VMT. Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.</p>
M85	Patricia Borchman		<p>I live in Escondido, and I was interested in hearing more about what you were talking about you were talking about you were responding to Toshi Ishikara's comments regarding greenhouse gas emission reductions, and you were referring to SANDAG plans about open space preservation carbon</p>	<p>Appendix AA of the 2021 Regional Plan outlines the Regional Habitat Conservation Vision for the region. The appendix provides a brief history of habitat conservation in the San Diego region; describes how SANDAG, through the Environmental Mitigation Program,</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			sequestration. So I'd like to know more about that because we are interested in pursuing an alternative to a project that's proposed to be annexed to Escondido for the Harvest Hills project, and we're trying to develop an alternative, and I think that this idea about the alternative to you know possibly you know pursue acquisition of open space to preserve sensitive habitat and wildlife corridors is you know is very consistent with the SANDAG strategy for open space preservation for the purpose of greenhouse gas reductions. So is there an appendix that I could go to find out more about the this plan?	<p>has contributed to habitat conservation and presents the goals and objectives of the Regional Habitat Conservation Vision in order to protect sensitive habitats and resources for future generations.</p> <p>As part of the 2021 Regional Plan, SANDAG will establish a Nature-Based Climate Solutions Program that will promote natural infrastructure that uses or mimics natural processes to benefit people and wildlife. SANDAG will prioritize resilience and innovative solutions in transportation infrastructure, Comprehensive Multimodal Corridor Plans, and consistent regional planning and implementation of the Sustainable Communities Strategy actions, emphasizing both nature-based and technological climate solutions. There are also further opportunities to expand upon ongoing efforts to assess the amount of carbon storage and sequestration potential of open space lands and the co-benefits from preserved open space, land management, and restoration activities.</p>
M86	Toshi Ishishara		So I live in Rancho Penasquitos. Any first of all, I want to say thank you very much for setting up this like a community forum, and they give us opportunity to provide inputs on RP. So I would like to know that in principle, I really support the MV. I mean a vision behind RP. Hasan called it's 5 Big Moves right so I like that and I also like you to know that I take transit as much as possible; however, pandemic kind of stopped me taking from taking training but so that I'm thinking about restarting, taking transit pretty soon I believe, but my question is about greenhouse gas emission reduction target. So according to Chapter 1, I don't remember, may not be Chapter 1, but also Sunday Staff stated the RTP will reduce per capita greenhouse gas emissions from transportation sectors to 10 below 2005 levels by 2035. That's right so 20 and as you know transportation sector actually accounts for 50 percent of - somebody came to my doorbell - 20, 50 right, so if we reduce 20 from 50 then we still end up with 40 percent, and as you know population is increasing. So if you look at Appendix X, so that's X, that estimate that - oh somebody came to my door so and then the person is yelling at me so I think I'm gonna stop now and I hope I can continue sometime later today.	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT.</p> <p>The GHG Inventory (Appendix X) analyzes emissions from all sources and the projections account for state and federal legislation currently in place, as well as strategies within the 2021 Regional Plan. The 5 Big Moves will result in people having more travel options and operating solutions, reducing per capita VMT, and the Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
M87	Toshi Ishishara		I'm calling and then everybody listening to this community forum, I'm sorry. What's happened actually somebody tried to break into one of my neighbor's house so that's what happened. So anyway so I I'm gonna keep my comment in less than a minute so anyway. So my concern is the greenhouse gas emission target and what the ROT will bring, and I read Appendix X and the Appendix X shows basically the prediction of the greenhouse gas emissions in this region, and I think the estimate was done by UCSD, but if I look at the trend, so after 2035 basically it's showing flat. There's no reduction beyond 2035. Of course we expect the population to increase, right? So the per capita greenhouse emission will continue to decrease; however, because it's fixing fixed at a certain level, and I see that level is still very high so that really concerns me. So how we are going to fight the climate change, and I thought Santa GRP would be the one of the weapon, biggest weapon for us to fight climate change in San Diego. So I would like to hear more about what SANDAG is trying to do, and if you can include some kind of specific specificity in the Regional Plan, how it will conform to the ambitious greenhouse reduction like a goal set by not only state of California but also like a San Diego County and the other I mean municipalities.	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT.</p> <p>The GHG Inventory (Appendix X) analyzes emissions from all sources and the projections account for state and federal legislation currently in place, as well as strategies within the 2021 Regional Plan. The 5 Big Moves will result in people having more travel options and operating solutions, reducing per capita VMT, and the local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
M88	Toshi Ishishara		<p>So I have one question and one comment. So my question is very simple. So some of my volunteers asked me about are we working on RTP or RP? Because I thought we were working on RTP by automotive so it became our business.</p> <p>[moderator response]</p> <p>Ok great, thank you. So then my comment is basically about this greenhouse gas reduction. So Chapter X, not the Chapter X. I'm sorry. Appendix X actually lists a whole bunch of sources of greenhouse emissions not only from like cars and light duty vehicles, electricity, natural gas, and solid waste, you name it. Everything there, and then I'm seeing basically reduction stop as I told you at 2035 and just stay flat from the point on so that's very concerning to me so I just want you to know that I'm-</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. <b>June 30, 2021 – Central San Diego Open House</b>				
M89	Alex Wong		<p>So yes, it's Alex from Monday, and I just wanted to short a question first of all. Now the mid-coast trolley, when it opens in November what will the frequencies be?</p> <p>[moderator response]</p> <p>So I think that's very good but and yeah but do you have any plans to increase the Green Line frequencies? Because it seems like with all the development happening in Mission Valley you know that might be a good place too.</p> <p>[moderator response]</p> <p>Oh well not the Orange Line in particular but rather I was thinking about this line through kind of mid-city and yes Hillcrest, right. I see it on your map. It's commuter rail, but I'm thinking that maybe it could be built as a trolley instead or even because I think it would be better if people could walk to their neighborhood stops instead of you know having to you know take a bus or a rideshare to a bigger station. And also I wonder if you've ever considered on any of these new lines that you're going to build that maybe you build something like the Vancouver SkyTrain, the Montreal REM. You know something that's fully automated. You know you can run them up to two minutes ,to two minutes per train at peak hour and then you know they could be very the operational cost could be very low because you know 17 percent of operational costs are from drivers.</p>	<p>Our goal really is to get the entire transit system on at least 10 minute all day service. For the trolley and all the railroads, we plan to go to seven and a half minute frequency all day. So we do have extensive improvements in overall frequencies of our light rail system.</p> <p>Blue Line is the route that goes from the border at San Ysidro to Old Town today. Ultimately, when Mid Coast opens in November, it will go all the way up to University City, with a stop at UTC at the very end of the line.</p> <p>The Green Line travels through Mission Valley, connecting to El Cajon and Santee, and it comes all the way through the center of Mission Valley into Old Town and downtown San Diego. So it's one of the connections that provides access through the center of San Diego.</p> <p>Our new line that will connect the Central Mobility Hub to the airport—that's our new transit connection—we are planning on that operating at every two minute headways throughout the day. So that's part of the capability that we're looking at for our system. We're not going to start out at two minutes on our bigger commuter rail service, but we'll be evaluating technology throughout the advanced planning of these services to make sure that we're using the most up-to-date and current technology. And if that includes automation, then certainly it will be included in our analysis.</p> <p>The regional plan is a big picture blueprint and further studies have to be on all of this. Regarding the purple line, we're looking at that whole line right now. We think we know where the stations are going to go, but this is at a really high level that gets further refined later. We were calling it a commuter rail. Now, when we do the further study, I don't want to say it would be a trolley, but that's a possibility, or we may find out some other kind of automated system is available and could make that work. Those things happen further down in the planning, but that is to give you a sense that the level of planning we're doing right now is very high level, very regional.</p>
M90	Deborah Jones		<p>Hi, how are you? I don't know how to turn on my camera but anyway. You know what I look like. In full disclosure I do work for SANDAG but just from a personal on a personal level, living in this area and also working in this area a couple of things that I'm wondering about as a citizen is whether ferry transportation is being considered for the plan. I've always thought it would be great to have some hovercraft ferries that go from downtown to the airport or from downtown over to Point Loma military base or from Chula Vista up to downtown or over to the airport just as a way to use our waterways as a transportation network and something maybe faster than what is currently used across to get to Coronado.</p>	<p>We do have a couple ferry projects in the plan, and really the first pairing that I'm going to talk about is a connection from Chula Vista to our military bases near 8th Street. That's a really strong commute, and then up to downtown San Diego. That probably has the highest level of potential ridership. The other one would be to connect Chula Vista to Coronado and then ultimately downtown San Diego, kind of creating a triangle. And we are in fact, looking at ferry levels of speed that are much higher than the existing ferry today.</p> <p>So those are the initial two that we have in the plan, but I'm sure that once we experience the value of those, we'll be pursuing that as a bigger strategy in future plans.</p>
M91	Deborah Jones		<p>And then I'm wondering if you can talk a little bit more about how sea level rise is being factored into these transportation projects knowing what our bleak future looks like. That's something that we're obviously needing to plan for so if we're going to have tunnels, do we have anything that stops the sea level intrusion?</p>	<p>For sea level rise, it's all about how we engineer these projects. If anyone's familiar with what we're doing even today on the LOSSAN corridors, all about raising up the bridges so that we're addressing sea level rise is exactly why we need, as Steven was bringing up, to get the tracks off the bluffs. That is very problematic.</p> <p>So it's really about, as we build the new infrastructure, that we're respecting sea level rise. The other aspect of climate change is making sure that we've got evacuation routes for the people in the rural areas. That's a big part of when we talk about improvements on the rural roadways, getting the evacuation routes so the people can get out in the instance of a fire.</p> <p>The design and construction of new infrastructure will consider the best available science, tools, and technology.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

M92	Deborah Jones		And then lastly because this is the topic du jour or certainly was for the year 2020, what impact telework or even the future of work and what industries will look like in the future. So where are we assuming, it is being assumed in the plan, that everybody's going to be commuting into an office or will we be teleported, you know? What does what does Star Trek vision look like for work and has that been factored into congestion and the way we work? Thank you.	<p>Telework is one of the strategies that is helping us to achieve our GHG reduction targets in the Regional Plan and SCS. Our assumption for the 2021 Regional Plan is that telework will grow much more than we've anticipated in past plans, but we know that many occupations cannot be done from home. To understand the potential for telework in the region and inform the telework target setting process, SANDAG conducted an analysis of jobs that are conducive to telework and found that 39% of all occupations in the region are considered home workable. This is a bit higher than the national average at 34%. It's important to keep in mind though that although a job could be done from home, it does not mean it will be. It's at the employer's discretion to determine who gets to telework, when and why.</p> <p>We also looked at the percent of jobs in our region that are considered essential. During the pandemic certain types of jobs were defined as essential and included jobs in grocery stores, healthcare, and transportation. In our region 64% of occupations were considered essential. SANDAG also randomly surveyed businesses and employees in the region. While 2 in 5 businesses expect to incorporate remote working in their business model post-pandemic, just 15% anticipate that half or more of their employees will work from home most of the week.</p>
M93	Haneen Mohamed		I am from City Heights CDC, and I just wanted to express that I think SANDAG did a great job with the Regional Plan, and we're really excited for some of the upcoming projects. Especially what it means for environmental justice communities, especially for those of us in City Heights, and we really like just seeing some of the transportation equity goals that we've been advocating for, for decades in the City Heights region come into fruition. We're really excited about the Purple Line serving City Heights. We think that's really going to bolster connectivity and really just connect some of our residents to job centers. So I ultimately just wanted to really express my appreciation for the SANDAG staff and that we hope to continue on this track of equity and really prioritizing the wellbeing of our communities, the wellbeing of the environment, and the climate.	<p>I'll just take this opportunity to mention to everyone here that SANDAG does have an Equity Working Group that is specifically assigned to advise on the Regional Plan and ensure that equity is at the forefront of this plan. That working group is chaired by City Councilmember Vivian Moreno. And within the next few days here, we are going to be having a discussion with the, the working group. And by the way, these are public meetings, so anyone here on the call is more than welcome to attend. The information about the meetings is posted, on our website, they're all done virtually. So, you know, you can do this from the comfort of your home, or your office, and we're really going to be talking about what is something, what's an early action that we can take, when it comes to equity. We're going to be asking our SANDAG board of directors to set aside some funding here in the next couple of months so that we can start to show what this Regional Plan could look like and pilot some of those ideas. So, thank you for your comments Haneen, and I know that City Heights CDC is really involved in the working group and appreciate all that participation.</p> <p>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 does include that station in the current proposed alignment.</p>
M94	Maria Cortez		I just want to know about the Purple Line because I would like for it to go underground. This way, we would be saving a lot of emissions and save a lot of time on traffic so from what I understood with the Purple Line it's supposed to be going underground, coming through City Heights going from the border all the way to Sorrento Valley, and another one that I'm involved in is that the buses to the beach. We would love to have the buses go to the beach because a lot of our kids and the different underserved communities have never been to the beach, and it's heartbreaking when you see that and hear that. I think it's a great opportunity to have these kids going to the beach exploring other communities outside of our communities, and also I would like to see more buses running more frequent. Having 24-hour service if possible because there are a lot of people that go to work, and they're out of luck when they go to work but getting back to the Purple Line. We need the Purple Line here in City Heights because we are one of the highest transit users in San Diego and to see it come through City Heights that would be a dream come true, and Todd knows all about that and everybody else. I'm Colleen, I want to say as always you have done a wonderful job and not only just you but everybody there at SANDAG. What a wonderful way to end the evening. So if I could have some answers maybe I guess on my questions that would be great.	<p>The purple line plans are that it would be fully grade separated.</p> <p>Grade separation means that you're either above on a bridge or below in a tunnel. It means that you're not in traffic. Right now, the trolley stops at intersections, and that can cause it to slow down.</p> <p>And for the beaches, we have over 10 routes that now will provide direct access to the beach. And once the central mobility hub is in place, people coming from all over this region will have access to routes that take them directly to the beach. So, that's a really great new story.</p> <p>For 24 hours service, we are evaluating, as I said earlier, increasing the spans of service across the system. And of course we are looking at, you know, we've heard time and time again that you'd like 24 hours on the blue line, so we're absolutely looking at that. We're trying to come up with a really good solution because right now we have the freight operating and that's causing us a little angst. So we're trying to figure it out, and I think we have a solution that we can come up with that will answer that request for 24 hours service.</p>

				<p>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 does include that station in the current proposed alignment.</p> <p>The 2021 Regional Plan includes increased service spans for the trolley and bus service up to twenty hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24 hours.</p>
M95	Nastassia Patin		I'm a resident of Normal Heights in San Diego, and I, similar to Haneen, I just wanted to express my strong support and my gratitude for SANDAG's work on this plan and some of the issues that it addresses with regard to environmental justice and just overall quality of life improvement in the San Diego region. And so some of the highlights for in this plan based on tonight's presentation were the grade separated routes that you just talked about to get East County folks out to the beach, the light rail and the dedicated bus lanes linking job centers like Sorrento Valley to the South Bay, and these fully connected bike routes. I can't wait to bike you know from Oceanside all the way down to downtown or even to the border one day so thank you so much for all your hard work on this, and I'm really excited to see it move forward.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> .
M96	Randy Torres-Van Vleck	City Heights CDC	"Hey, Colleen. How's it going? Thanks for hosting this. Good evening, Central San Diego, and my name is Randy Torres-Van Vleck, director of policy and planning at the City Heights CDC. I'm really excited for the opportunity that the 5 Big Moves creates to transform our regional transportation system in a way that improves quality of life. Congrats to staff on the release of the Regional Plan Draft, and I really appreciate that staff has a lot like a live dialogue here between the agency and the public. I think that's really important so thanks for like taking our questions on the on the fly. That's awesome. Again yeah there's a lot to analyze in this 2,000-page document through both the San Diego Transportation Equity Working Group and the City Heights Built Environment team. We've been collectively analyzing the plan so here are just some of the takeaways and some of the things we like, some of the things we hope to see improvements on. So we're very excited about the Purple Line Commuter Rail, also known as Maria's Purple Line, that's gonna connect South Bay, Southeast, City Heights, Mission Valley, Sorrento Valley. Really excited for that route. That's going to be really critical improvement.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="https://www.sdfwd.com">SDForward.com</a> . The 2021 Regional Plan data viewer can be used to explore draft plan projects in your area.
M97	Randy Torres-Van Vleck	City Heights CDC	Expanding the rapid network is going to be key and making those near-term investments to increase transit frequencies is going to be important and as part of those local investments in the transit system, we believe it's important to look at 24-hour transit. Late night and 24-hour transit was ranked as the highest, most supported public improvement during MTS' Elevate San Diego Outreach process. The third track for the Blue Line that'll allow 24-hour service, greater frequencies, eliminate that conflict between freight and transit, and allow for express service is going to be important as well.	SANDAG will be undertaking a Blue Line study in 2022 to refine how the travel time could be speed up. SANDAG is also working with our Community Based Organizations to increase service frequency on routes that would benefit our social equity communities.
M98	Randy Torres-Van Vleck	City Heights CDC	We want to see enhancements maybe through the mobility up process that allow for dignified transit riding experience, specifically bathrooms because that's something that we don't really have a plan for here, and lastly I think we could do a lot better at. The youth-opportunity passes and free transit scenarios is going to be important.	The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M99	Randy Torres-Van Vleck	City Heights CDC	That's something that residents and mid-city have supported for a long time, and we're supportive of converting general purpose lanes on freeways and to better uses. So we appreciate the planned calls for that. As you recall, Colleen, you know 2015 we helped secure that analysis for the 94 freeway but through that work residents identified concern, expressed concerns with adding more lanes that would increase vehicle miles traveled on the 94 and 805. So we want to we have some questions about those new managed lanes. Love to get more about that	The intent of the managed lanes is to create a flexible system that can be managed in real time. This is similar to how the I-15 corridor is currently managed in North County today. Solo drivers will have options to use the lanes but at a price and transit services can travel congestion free. The result is better optimization of the system that encourages higher occupancy travel but with real alternatives that are competitive with driving.
M100	Randy Torres-Van Vleck	City Heights CDC	and then equitable coastal access, as Maria pointed out, is something that's important. The beach and coast should be enjoyed by everyone, not just those who can afford to live nearby at the coast or afford a car.	The 2021 Regional Plan includes upgrades to existing transit service through the creation of <i>Rapid</i> Routes 10, 30, 103, 473, and 950 with service to many beaches along the coast. Further development of the Coastal Rail Trail and other active transportation routes will improve non-motorized access to the beaches as well.

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
M101	Randy Torres-Van Vleck	City Heights CDC	And then finally we just have general questions about the phasing of the projects. You know that's something that is very just like personal to City Heights residents as we've waited for decades for active transportation transit improvements. So what are we gonna do? The question is what are we gonna do differently in these next 15 years compared to what we've done these past 15 years to get projects, transformative ones, built more quickly? Yeah looking forward to these you know some of these answers and working with you all on getting the 5 Big Moves approved. Thank you."	Response provided during the public meeting: Ultimately it is the voters of the San Diego region that are going to decide if they want to buy this plan. And so at some point in the next year or two years, there will very likely be something on the ballot for consideration. So that's the first thing I wanted to mention, and that would not be the only funding source. A new sales tax measure, for example, would allow us to leverage state and federal dollars. And for anyone who's been following work that SANDAG's been doing, on average for every dollar we raise in the San Diego region, we're usually able to get two dollars and fifty cents in return from state and federal programs. So that's a start. We also have laid out a number of other funding strategies, because it's not just the sales tax measure that's going to get us there. So I wanted I want to share that with you. The other thing with the team is working on right now is if you've had a chance to look at the two appendices U and V, that's how we fund the plan. And some of the phasing plan is also in appendix A. We're working to really align that and get more refinement on things. It's really important to keep in mind, again, as I mentioned earlier, this is really a big picture blueprint. There's a lot of additional work that needs to get done to really refine that phasing. But we're at least going to lay out a more detailed phasing program as we develop the final.
M102	RightCow LeftCoast	San Diego Wikimedians User Group	You do have it correct. RightCow LeftCoast. It's my username on Wikipedia. I'm actually with the local Wikimedia Foundation affiliate, San Diego Wikimedians User Group. Again, thank you for the opportunity for letting me speak. I have a couple questions regarding the topic you have presented today. Actually four here. As you may know, the navy plans to shift 60 percent of the overall fleet to the Pacific, which will including basing ships and units here in San Diego as it is home to the two-third fleet. Has San Diego factored that population growth into its planning?	We have been working very closely with the US Department of Defense, and we ask them to provide us information on their anticipated growth, and that goes into what we call our regional growth forecast. So to the extent that our friends at the Navy are able to provide us that information, we include that in our population projections and in our projections about job growth. The Navy is such an important partner here in the region, big part of our economic engine, and so we do work closely with them to make sure that we have the latest information from them.
M103	RightCow LeftCoast	San Diego Wikimedians User Group	Then my next question. Many individuals who work within the County of San Diego commute from Riverside County and few from Imperial County. How has SANDAG worked with out neighboring counties to increase transit interoperability?	<p>When it comes to Imperial and Riverside, we do work with the neighboring counties to look at what's happening with that cross border transportation. We do multiple surveys, and we're always looking for ways to look at travel options there. I think probably the best way to do that is through the connections of our managed lanes.</p> <p>For RCTC, the Riverside Transit Authority, we have worked closely with them. When we first started this plan, we drew connections and big circles around Orange County, Riverside County, the border, Imperial County, and further east towards as you're heading into Arizona. We know that these are connections are really important, and San Diego isn't landlocked. We are dealing a lot with our neighbors in each area. So the plan currently has a lot of connections in Escondido, and then there are plans in the future to extend our routes up to potentially Temecula to coordinate with RCTC.</p> <p>But in the plan is high speed rail, and high speed rail connects our Inland Empire along Riverside County, across the center of our region, and down into downtown San Diego. So, that's really the route that we see as the fastest connection from those inland Empire areas over to our downtown San Diego area.</p> <p>Related to Orange County, we work with our neighbors to the north, and today we have we have the transit service Metrolink that stops at the Oceanside Transit Center. And we also have the Amtrak Pacific Surfliner that serves both Orange County, Los Angeles, and our region. So it's something that we're always looking at ways to align all the transportation between Orange County and our San Diego region, and also with Imperial county and Riverside.</p> <p>On LOSSAN too, part of what we're looking at is creating an interconnected rail service. So the Metrolink trains could come all the way down and operate through the LOSSAN corridor, and then we can provide those direct connections. That is part of the state rail plan, that's part of SANDAG's plan, and that's part of why we're doing those improvements on the LOSSAN corridor.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
M104	RightCow LeftCoast	San Diego Wikimedians User Group	Next, many of many persons commute to from our international neighbor to the south, Mexico. How has SANDAG worked with federal authorities to ease the commute to our coworkers who live in Mexico?	SANDAG appreciates your support and feedback. The SANDAG Borders Committee was established in 2001 to bring together elected officials and representatives from all neighboring jurisdictions to address joint challenges related to regional planning and collaborate across jurisdictional and international boundaries to develop and implement strategies within the broader context of the megaregion. The Mexican government is represented through the Mexican Consulate as an advisory member of the Borders Committee as well as Board of Directors. The 2021 Regional Plan is designed to build on the close working relationships among partners throughout the California-Baja California binational megaregion, including those at all levels of government in Mexico. Efforts will include completing the Otay Mesa East-Mesa de Otay II Port of Entry project, implementing the Regional Border Management System (RBMS), and advancing the San Ysidro Mobility Hub project. These and other initiatives will help create the momentum needed to improve crossborder mobility. Appendix J includes more information on SANDAG's approach to working with binational partners. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
M105	RightCow LeftCoast	San Diego Wikimedians User Group	And lastly, though this might be outside the present presentation's purview, do you have any information about real connectivity of San Diego to Baja California and Imperial County to include the historic Goat Canyon Rail Bridge in Carrizo Gorge. Thank you very much for taking the time to answer these questions.	SANDAG is working with MTS and Caltrans to identify future freight opportunities on the Desert Line. For additional information on the Desert Line, please visit: <a href="https://www.sdmts.com/about-mts-meetings-and-agendas/sdae">https://www.sdmts.com/about-mts-meetings-and-agendas/sdae</a> .
M106	Stephen Tessier		So I think a quick and easy way to facilitate traffic or trolley movement through downtown would be to give it a signal priority. I lived in France for six years back in the 1990s and that's just what they did. They just gave it automatic signal priority and there you go. Secondly, just a quick question regarding double tracking the line all the way down to well eventually ideally take the commuter rail all the way down to the border is the existing line extending it through Santa Fe Depot all the way down to the border is and then taking it off the bluffs you have to take it you know. That's just a to anybody really looking at that situation, that's just an a disaster waiting to happen and it's not going to get cheaper by waiting to move it off the bluffs. I don't I just wanted to to see what you guys I'm certain yeah I'm certain that's on your plate. I just like to know if there's anything specific that you guys have to speed that up.	<p>SANDAG recognizes addressing the bluffs as a priority. The Regional Plan identifies funding for bluff stabilization in the short term while also prioritizing funding to start work on a long term solution to realign the rail corridor into a tunnel in Del Mar by 2035. There is also a project to bypass Miramar Hill and realign the tracks in a tunnel with a new station at UTC by 2050.</p> <p>Regarding your idea to go all the way down to the border, we are working to take the Blue Line trolley and create a type of service that would be express.</p>
<b>July 16, 2021 – SANDAG Transportation Committee Meeting</b>				
M107	Maria Cortez		So I too also want to mention that we do need more bathrooms because a lot of times as has been said those of us that are younger need to use the restroom and can't, we have to go somewhere else and when we get back we've either missed the bus or we've missed the trolley, and we have to wait again. And also families with younger kids, it's you know painstaking to see them having to hold it and sometimes they can't. And also I am in agreement also with Stephanie about the no expansions on the freeways because my god, we're already bad enough as it is and so we need to be more, having more buses running on time and also more frequency. This way we will reduce the gas emissions and carb and also I too would like to see more information being used by the by the buses and the trolleys vocally because sometimes you miss what they, what's been flashed or what's been said. Sometimes they're not saying it frequently enough, and I too would like to see that happen. And also I've noticed that the security guards there are much nicer now, and I just want to say thank you for you guys and MTS. I'm taking hold on that and I too would also like to thank SANDAG's staff for everything that they've been doing. As I said earlier, it's about time and my hat's off to Hasan here who is who has shown incredible leadership. And also I would like to congratulate him for having to having to be with us for the next three years, and as you will see the community is also now starting to see and trust SANDAG more with the transparency.	<p>The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p> <p>The 2021 Regional Plan is not proposing any new highway expansions or addition of highway general purpose lanes but rather is focusing on a regional network of managed lanes to ensure that the Regional Plan meet state and federal greenhouse mandates, reduce traffic congestion, and address social equity. Proposing a managed lanes network that uses existing infrastructure by converting shoulders or general purpose lanes gives an opportunity to increase capacity on lanes that traditionally would not benefit from increased use of high occupancy vehicles or transit.</p> <p>Your comment has been forwarded to San Diego Metropolitan Transit System (MTS).</p>
M108	Michelle Krug		I have not had a chance yet to have someone go over the details of the Regional Plan yet. I will do that, but I do want to emphasize as much as possible to please bear in mind having as many audio sim signals. So when I'm at a trolley, because I'm blind, when I'm at a trolley station I love that we do have more information written you know on signage, but can you also keep in mind maybe having more audio saying when the troll- what trolley is arriving, but you know that's in the public transportation and on the buses. And the other thing is pushing or emphasizing the 24-hour service which as someone who's retired now but as a wastewater operator I worked rotating shifts, and it would be	<p>The transit operators work on the ADA announcements at stations. We will forward them your comment. SANDAG is undertaking a study to determine which routes would be eligible and able to be operated 24/7. This study should be done in late 2021.</p> <p>Your comment has been forwarded to North County Transit District (NCTD) and San Diego Metropolitan Transit Service (MTS).</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			great if we really were able to safely use transportation no matter what shift we were all working. Thank you very much for your work, and Hasan is just our angel. He has just brought hope in a way that I've never felt for decades since I've been here in 1979.	
M109	Rocina Lizarraga	Olivewood Gardens	I would like to appreciate all the comments from my colleagues that are joining in this movement of advocacy and activism and both being vocal in this Regional Plan. I'm Rocina Lizarraga, and I work for Olivewood Gardens in National City, and our city has been historically disinvested and been penalized despite the efforts of the local jurisdictions to provide most of the amenities. Our I just want to advocate for this time for the senior population. After revisiting all the graphic and reading and reading and inquiring about that, and I know there's a great report in all the data that shows that our communities are in necessity. The assessments that we've been done after doing that we just I discovered myself that there's very little amenities for people with that is aging. That we have a large population of seniors that they decide they deserve considerations of biological necessities and also disabilities not only physical but sensorial and also disabilities on necessities that they need when using transportation. Most likely they use public, private transportation because it's more convenient but doesn't align with this non-used cars and use public transportation gold that we have with this draft plan. I'm looking for Appendix Q, Appendix L, and there's figure that says safety but it doesn't it does not reflect what we wanted to see. I'm so purely support what member Jennifer Martinez is saying that there's biological necessities that they have because they're aging. So I would like to see more of that and I think the team on SANDAG is completely in that they will revise again and see if we can reflect this type of necessities for our our disabled population in all ages because it says all ages are included in this and considered in this draft plan. So I would like to see more of that, and I would like to see in the future the lengthy implementation of these programs.	<p>We would like to refer you to Appendix H: Social Equity Engagement and Analysis. There, you will find an increase to regionwide access to basic needs -- such as medical facilities, parks, and retail -- for seniors through 2050. According to Appendix H, transit access for seniors to medical facilities increases from 79.5% in 2016 to 84.5% by 2050.</p> <p>In Appendix B: Implementation Actions, you will find our curb management strategies, which will aim to best-use and manage all modes of transportation on our streets for everyone safely and efficiently. One of the key elements of curbside management are paratransit and accessible loading areas to serve our disabled populations.</p> <p>Also in Appendix B are our strategies to align with the goals of Vision Zero, a national policy aimed to protect especially those most vulnerable to fatalities (i.e low-income, those with disabilities, children) involving people walking, biking, and traffic collisions. One of SANDAG's near-term actions towards Vision Zero includes developing and implementing a regional safety policy.</p> <p>For more details on these initiatives, please see Appendix B.</p>
M110	Scott Anglum		I'll be very brief. Once again, the draft Regional Plan is revolutionary and hopefully, if anything, it'll be expanded in its scope and depth. There is widespread support for the initiatives that are outlaid within them and once again please recognize that there is great public support, great public emphasis behind sustainable, regular and reliable transportation in the region so that car dependency is not the default in the area. All right, that is all.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
M111	Stephanie Hernandez	City Heights CDC	I am a program manager at City Heights CDC and also a member of the SANDAG Social Equity Working Group and San Diego Transportation Equity Working Group. I just really wanted to emphasize and recommend that Transportation Committee members read that transit, the 10 transit lifeline document that the San Diego Transportation Equity Working Group has shared with you all that really addresses our priorities for the Regional Plan, such as, as mentioned, bathroom access, transit frequency, Purple Line alignment in City Heights. But I also wanted to just mention that a lot of our residents that we've spoken to also want, we'll be sharing a letter fairly soon, but a lot of many have addresses just making sure there's an increased access to the bay, the beach area. A lot of youth cannot access the beach who live in City Heights, and it takes about two hours to get there so we really recommend that there is some type of mention of beach access in the Regional Plan again and also making sure that there is no freeway expansions. You know freeways definitely have divided communities like City Heights, and so we recommend that bus transit-only lanes are prioritized moving forward.	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p> <p>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582 (Purple Line). The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</p> <p>The Regional Plan outlines the following projects in the Pacific Beach/Mission Beach areas. These proposed projects can be viewed in more detail using the Dataviewer on <a href="http://SDForward.com/envision">SDForward.com/envision</a>. Pacific Beach Mobility Hub.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

				<p>Complete Corridor Arterial improvements on Ingraham Street, Mission Boulevard, and Grand Avenue.</p> <p>On-street and off-street bike and pedestrian facilities from Pacific Beach to East Mission Bay</p> <p>On-street bike and pedestrian facilities on from Mission Boulevard to Pacific Beach Drive</p> <p>Rapid 292 - Pacific Beach to Kearny Mesa via Balboa Avenue to Grand Avenue</p> <p>On-street bike facilities from Pacific Beach to Mission Beach via Cass Street</p> <p>Next Gen Rapid service on Route 30 to the Balboa Station</p> <p>Specific community plans and decisions regarding land use will remain under the authority of local jurisdictions and will require future collaboration with community members and the City of San Diego.</p>
M112	Toshi Ishihara	SanDiego350	<p>I'm a member of San Diego 350, and I'm also a member of San Diego Equity Transportation Working Group. So I'm a climate change and transportation equity advocate. So Hasan, his staff and also board members and also public, I really appreciate you putting together this draft Regional Plan. I like a part of it, but I think it is not challenging enough, means it is not challenging the reality we have today in terms of like greenhouse gas emissions and climate change. As you know, the world is burning, and our survival is at stake. And if I look at the Chapter 1, page 13, it says the Regional Plan will reduce net capital greenhouse gas emissions from cars and light duty trucks to 20 percent below 2005 levels by 2035. Of course that exceeds the region's mandate target of 19 percent, but if we look at the fact that more than 50 percent maybe around 50 percent of the greenhouse gas emissions in these regions are coming from transportation right and the 20 percent to 50 percent like a simple state maybe 10 percent reduction, but it is not the case because we are talking about reduction of 20 percent below 2005 level. So that means to me we are talking about target which can make only tiny dent to the entire and overall greenhouse gas emission from the transportation system in San Diego. So I like Regional Plan, but I would like to see SANDAG take some more like aggressive stance in order to fight greenhouse gas emissions and also fight climate change.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT. The 5 Big Moves will enhance connectivity and result in people having more travel options and operating solutions, reducing per capita VMT.</p> <p>Senate Bill 375 also requires the 2021 Regional Plan include a Sustainable Communities Strategy (SCS) for the San Diego region. This SCS describes coordinated transportation and land use planning. When combined with the transportation network, the SCS exceeds the state's target for reducing per capita GHG emissions set by the California Air Resources Board.</p>
<b>July 23, 2021 – SANDAG Board of Directors Meeting</b>				
M113	Ariana	Mid-City CAN	<p>I'm calling in with Mid City CAN. I want to say thank you to SANDAG for working so hard in drafting the 2021 Regional Plan. We are asking that they include youth opportunity passes, no-cost transit passes for youth for ages 24 and under. When it comes to the transit subsidies we are asking for them to be the priority group. In the pandemic we have seen that there is a need to develop lifelong transit riders. I think that YOP can definitely do this. When we are investing in young people we are ensuring that young people have the opportunity to access school, work, and other activities. I myself was a transit rider for many years. Because of this, I was able to get a lot opportunities I couldn't get as a young person. Youth opportunity passes really addresses the need for sustainability. We are hearing from other speakers that there's a lot going on that is impacting our world and we need more folks from all economic backgrounds to ride transit as a method to reduce emissions. And YOP is actually a key strategy to make sure that we increase ridership for all these folks. YOP is already a program that has been invested in in other cities in California so I hope that YOP is listed as a priority group.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
M114	Bee Mittermiller	SanDiego350	<p>I'm from the San Diego 350 Organization, I'd like to congratulate SANDAG staff for putting together this incredibly detailed Regional Plan. It finally sets the goal of creating a public transportation system that has the potential to attract new riders who want a way to get around without the frustrations, headaches, and costs of congestion, car ownership, and parking. Shifting people to the use of public transportation, bicycles, and walking are the most effective ways to improve mobility and reduce greenhouse gas emissions. Improving this will also keep the riders who are already depending on the system. As everyone mentioned, we are living in a nightmare of the climate crisis. This cannot be denied any longer. San Diego can do its part to address this crisis by adopting the 2021 Regional Plan but we want SANDAG to prioritize all of the projects, big and small, that will reduce greenhouse gas emissions as fast as possible while also addressing equity. We appreciate the staff's past and future outreach to all individuals and organizations who want the best planning for our region. As members of San Diego 350, we plan to remain engaged in the process and look forward to further discussions.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
M115	Belen Hernandez	Mid-City CAN	I am a policy advocate with Mid-City CAN. We are calling to request that you amend the 2021 Regional Plan to state that youth opportunity passes, no-cost transit for youth ages 24 and under, will receive priority when transit subsidies are allocated. When you invest in youth opportunity passes, you are truly investing in youth lives. Young riders depend on transit at a much higher rate than adults. In San Diego, young commuters ages 16 to 24 use public transit at a rate double that of adults 25 to 59. YOP is about equal access to opportunity. Transit-dependent youth ages 24 and under need no-cost transit to get to school, work, medical care, recreational sites, and life opportunities. The cost of a pass is a barrier for many families earning minimum wage. It is also an investment in sustainability. We need more people from all socioeconomic backgrounds to be riding transit as a method to reduce carbon emissions. YOP is a key strategy to increase ridership from all socioeconomic backgrounds and develop lifelong transit riders in our region. We need YOP to increase ridership and be sustainable. Lastly, it is also an investment in a proven program. San Francisco, Sacramento, Los Angeles, Santa Ana, Alameda, and more jurisdictions across California and outside of California have already implemented similar programs. SANDAG must take bold action and include YOP in our 30-year vision for transportation in the region. The program has proven to work for people and transit agencies. Please amend the 2021 Regional Plan to include youth opportunity passes, ages 24 and under, and funded as an early action pilot program. Also included the 10 transit lifeline projects brought forth to you in a letter from the San Diego Transportation Equity Working Group, which represents the priorities and needs of the communities we serve.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M116	Catherine Harrison		I live in San Diego, and I taught in city schools for over 32 years. I truly appreciate the shift SANDAG has taken to accomplish transit goals but I think the greenhouse gas reduction goals are too low and the project timelines are too slow for the speed and gravity of the current climate emergency. There is still too much emphasis on roads for private vehicles. Climate change is manifesting itself quickly all around us so our response needs to be big, bold, and fast. A way to cut car emissions, which are about half of the county's total emissions, is with attractive and enhanced public transport that provides efficient and easy mobility for all of us. I've taught many years at a small public high school downtown on the campus of City College, where students come from surrounding low income neighborhoods. The school district provides free or discounted youth passes for MTS, depending on family circumstances, and this has made a huge difference for our students allowing them to flourish and take college classes early. I've seen the problems that occur when they can't get those passes in a timely manner or when trolleys don't run efficiently enough to help them juggle their time commitments to school, work, and family. The Regional Plan should include free transit passes for all school-age youth and young adults much sooner than 2027. To help them in every way possible, join our vibrant economy and citizenry. Furthermore, no-cost passes will encourage significant participation in public transportation and shift expectations for how San Diegans use transit, allowing us to meet more accelerated targets for greenhouse gas reductions. We can do better than forty percent by 2030 if we act quickly on public transit goals.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M117	Cheyenne Martinez		I request that you amend the draft 2021 Regional Plan to state that youth opportunity passes, no-cost transit passes for youth ages 24 and under, will receive priority. As a youth from National City and recent graduate from UCLA, I have firsthand experience understanding how no-cost transit promotes accessibility for youth to excel in school, jobs, and early career opportunities. In Los Angeles, I benefited greatly from no-cost transit as it allowed me to navigate the city and go to work in order to support myself in my undergraduate career. The low income youth of San Diego region deserve better mobility. With that, I ask to please amend the 2021 Regional Plan to include youth opportunity passes for all youth 24 and under and funded as an early action pilot program.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M118	Craig Jones	Alliance for Regional Solutions	I'm a representative to the Social Equity Working Group from the Alliance for Regional Solutions, which represents communities with unmet need in North San Diego County. One of the points that Mr. Bullock, Mike, was making before when he ran out of time on your public comments was that the world is literally on fire here with climate change, and this is true. Let's just look around and admit what's happening here. We have a local, regional obligation to act as quickly as possible to counter and stop the production of greenhouse gases. The Regional Transportation Plan, the draft and the Regional Plan that has been proposed moving forward as quickly as possible will fulfill our moral obligation to do so. So I'm speaking in favor of the five big moves and the 10 items as well. Those who show some reluctance on supporting this plan are fearful about change and economic impact. If we	Thank you for your support of the 2021 Regional Plan and the climate strategies contained in the Plan.

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			don't address climate change, the economic impact to all of us is going to be horrendous. So we must move forward on this.	
M119	David Grub		Climate disruption is here now. Just look at the headlines. Floods, droughts, massive fires getting worse every year, people dying from extreme heat, and our agricultural industry having to scale down from lack of water. Anyone who is paying attention and taking it seriously knows what we need to do. We must reduce greenhouse gas emissions in every way we can before it is too late. What that means is as good as this plan is, it needs to be better. Don't get me wrong, I have been looking at regional plans for twenty years, and this is the best plan I have ever seen for our region but I worry that it does not go far enough or fast enough spending money on highways when we all know that we need to drive less, is not the best thing we can do. We need to prioritize active transportation and transit, and put off expanding freeways. We must choose actions that get the most greenhouse gas reductions per dollar first. Transportation demand management and cutting subsidies to driving are fast and effective ways to reduce greenhouse gas emissions at low cost. Do them first. I'll close with a quote from the past. "You don't need a weatherman to know which way the wind blows".	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.
M120	Denise Lopez		I will be going to UCSD this fall. I request that you amend the 2021 Regional Plan to include that youth opportunities passes will be used for youth 25 and under. As a youth dependent on transportation for my four years in high school, I have seen that we have struggled getting to school on time. This is very important to us. I will need the youth opportunity pass to attend UCSD which is very far away from me. There have been opportunities that I've had to turn down due to lack of transportation options. We are unable to travel safely at night because the buses stop running at 10 PM.	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
M121	Haney Hong	San Diego County Taxpayers Association	<p>I am the President of the San Diego County Taxpayer's Association. It's good to see everybody again. You may recall that a couple months ago, Hasan invited me to moderate a panel of experts around different revenue streams and mechanisms to finance the future region's transportation system.</p> <p>I'm here because I want to acknowledge first that there's a lot of hard work that's gone into the Regional Transportation Plan, and I think it's important to say thanks to all of you as well as the staff under Hasan's leadership for putting in all the time and effort to develop this draft.</p> <p>I also want to state that it's really important that as we go through this draft and go through this discussion and achieve the public policy discussion that Hasan talks about the region needing to have, we need to understand what goes into the plan. What are the assumptions that are built into the plan? What were the methods that were used to develop the plan, as well as what are the sensitivities in terms of the finance, when assumptions change or rates are different than for instance, what might be assumed in the plan? So, I just want to share for the record that the San Diego Taxpayers Educational Foundation, the research arm of the Taxpayers Association, has a working group of folks here who've submitted a bunch of questions to staff. And it also has been submitted here for this meeting for the record, and I think that addressing those questions will help assure trust and assure understanding around the Regional Transportation Plan, the final draft. And I just want to say thanks in advance to the staff and Hasan for addressing the questions that we submitted.</p>	We have received the list of questions regarding revenue and cost estimates on the 2021 Regional Plan and are responding to each concern raised.
M122	Jim		I am from Encinitas. In the many years since World War II we have devoted a vast majority of our transportation dollars to cars, cars, and more cars. In the past, it made sense, but now we know about the many downsides of cars which are climate change and social inequity. While there are cars and more cars, let's build a cleaner, healthier, more convenient, and more inclusive transportation system. We don't have to start from scratch because there are many examples from around the world that we	The 2021 Regional Plan seeks to offer fast, safe and reliable transportation options for the San Diego region that make public transit a competitive alternative to personal vehicles. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			can leverage. We don't have time to waste. So let's start right now aggressively and assertively as possible.	
M123	Karina Gonzalez	Hammond Climate Solutions	<p>I live in Chula Vista, and I am with Hammond Climate Solutions. I want to thank the board and staff for your leadership in drafting this plan. I'm encouraged by SANDAG's bold, new direction, and I want to ensure that the 2021 Regional Plan is as strong as possible for climate, jobs, and justice.</p> <p>As you all know, the climate crisis is rapidly accelerating, and we need bold action from SANDAG in order to ensure that the region is doing everything possible to reach zero carbon. I encourage the board to exceed emission targets put forward by the state, prioritize mode shifting away from gas-powered vehicles, and provide much needed funding to the regions communities of concern, who have historically experienced underinvestment when it comes to transportation improvements. I grew up driving my dad to and from public transit and have seen firsthand how our transit system is not working in communities of concern. We need to invest in these communities who are on the front lines of environmental injustice and who suffer from disconnected public transit.</p> <p>Finally, I encourage the board to fully fund youth opportunity passes, something that community-based organizations have been advocating for years because every San Diegan deserves access to high-quality transportation and economic mobility, especially our young people.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
M124	Katie Meyer	SanDiego350	<p>I'm calling with San Diego 350. I'm calling because I both wanted to thank the staff at SANDAG for their progress around transportation in this Regional Transportation Plan. This is a huge step forward, and as a lifelong transit rider, I appreciate this progress. I also want to encourage you all to move further in this plan to meet our emissions targets and properly address our climate crisis. San Diego 350 wholeheartedly supports incorporating the 10 transit lifelines into the plan, and I especially want to encourage you to accelerate the timeline for all transit projects. So that includes trolleys, buses, rail, and biking infrastructure. Environmental justice communities need transit solutions the most and need them right now, and they disproportionately suffer from the effects of climate change.</p> <p>We need to move these projects up as well as encourage you all to adopt 24-hour service and 10-minute frequency on popular bus routes right now. I personally have been trying to take the bus late at night many times, and I know from experience how frustrating it is, and that is not serving the needs of the community or the needs of environmental justice communities.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p>
M125	Laura Walsh	Surfrider Foundation	<p>I'm with the Surfrider Foundation. I just want to thank the board and staff for their leadership on the draft RTP. I represent the Surfriders and we talk about the value of the coast. I'd like to make a point that the beach and coastline affect all inlanders as the rising temperatures as the rising temperatures we are all currently experiencing continue. This just brings home the point that the climate crisis will impact people who are already disadvantaged. I live in Ocean Beach but my office is in Hillcrest and the temperature change is dramatic just driving to work. I appreciate that this plan is beginning to acknowledge this and hope that it leads to solutions that can solve these inequities. On behalf of Surfrider, we really hope that this plan will ultimately enable measures and funding to get people to visit the many beautiful beaches in our community. I echo the point of amending the RTP to include youth opportunity passes. I took the bus to all my internships as a college student and it really is a frustrating experience to make a name for yourself as a professional and always be late. Anything we can do to make this easier especially for people who are trying to make ends meet is really important.</p>	<p>SANDAG recognizes the urgent need for reduction of GHG emissions, especially in our most marginalized communities, as a key aspect in an equitable and sustainable future for the region. I would like to direct you to Attachment2 in Appendix A: AB805 Pollution Reduction Strategy, where you will find a list of transportation projects aimed to reduce pollution exposure in our region's disadvantaged communities in accordance to AB805 and CalEnviroScreen 3.0. More detail on phasing and funding allocations to these projects can be also be found in Appendix B: Implementation Actions.</p> <p>One of the plan's near-term Implementation Actions listed in Appendix B will be a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, students, and youth.</p> <p>For more information on the the Regional Fare Impact Study and anticipated transit fare subsidies, I would like to direct you to Appendix B: Implementation Actions and Appendix U, respectively.</p>
M126	Lori Saldana		<p>I want to start by thanking you for including the Black Contractors Association under project labor agreements. It's essential to address the long term and ongoing lack of equity for black citizens here in San Diego. We see the racial and economic injustice in our region where we have 5 percent of our community is black, yet 20 percent of our unsheltered population are black. This shows why we need</p>	<p>SANDAG is currently developing a Regional Housing Incentive Program that will support the development and adoption of policies and process improvements to accelerate housing production for very low-income-, low-income-, and moderate-income housing while taking several factors into consideration to ensure the program meets the goals of</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			<p>to have the executive order signed this year by President Biden to make sure that public contracts addressed as ongoing racial inequity. Related to that, an increasing number of riders on transit are unsheltered. We need to consider adding them as a community of concern. They're disadvantaged, their health is often challenged, yet many of them are employed they are workers. They need transit to get to and from their jobs. Related to that, I would encourage looking providing safe parking near MTS stations. So that people who are working and lack a permanent home have a place to park that doesn't kick them out and put them at risk. Regarding convenience, please coordinate events that are ongoing regarding being more competitive in transit. Please have extended hours especially for areas that have nighttime events so people who are not comfortable driving at night and want to partake in community events later in the evening have a later transit ride. I know that this is a MTS issue, but please take this into account. Making the ride safe and comfortable again goes back to addressing the needs of very diverse people including our unsheltered population.</p>	<p>the 2021 Regional Plan. Additionally, SANDAG will coordinate with the Social Equity Working Group and other interested stakeholders to ensure the housing program promotes equity and addresses issues like gentrification and displacement.</p> <p>Most of California's unsheltered population resides in major metropolitan areas; however, homelessness impacts communities of all sizes. Efforts to address homelessness are led by local jurisdictions in the region and SANDAG supports their efforts to seek funding sources from the State Department of Housing and Community Development (HCD) to address homelessness, begin initiatives, or conduct pilot programs. For more information, please visit: <a href="https://hcd.ca.gov/policy-research/specific-policy-areas/homelessness.shtml#">https://hcd.ca.gov/policy-research/specific-policy-areas/homelessness.shtml#</a>.</p> <p>SANDAG agrees that Safety in and around regional mobility hubs including transit stops situated throughout these communities is of utmost importance. Future improvements to create well-lit stations that also offer amenities like clean public restrooms or secure parking for personal bikes and other micromobility devices will contribute to comfort and convenience as well.</p>
M127	Mike Bullock		<p>I'm from Oceanside. I'm a systems engineer. I have written a peer- reviewed report showing how cars and light duty trucks can achieve the first climate stabilization target, which is 80% below our 1990 levels by 2030, very quick. I plan to write a detailed letter, but I just want to give a few short comments today.</p> <p>I support the 10 lifeline provisions as stated by the 350.org speaker, and I agree with the call for the youth opportunity passes, but I think we have to make this much bigger than that, part of an overall system as called for in the California Democratic party platform.</p> <p>I just want to quote what's in that platform. Support the design and implementation of a single, environmentally sound technology system that will collect and distribute fees for the use of roads, parking, and transit that is both economically fair and convenient and protects user privacy and the interest of low income users. And certainly youth would be free, and a lot of other individuals would also be free. That would be means-based, of course.</p> <p>Now just broadly, in Chapter 1, you've got that big triangle there with the three challenges: congestion, and the best way to do that is with congestion pricing, road use charge will provide a platform for that; social equity, and you need a good road use charge, you need a fair car parking system if you want social equity; state and federal mandates has to be expanded. I'm sorry, there's too many words at the bottom part of that triangle, but it should say state and federal mandates and climate science-based climate stabilization targets. And just to let you know what's coming down, the mayor has asked CARB to come back and tell him what it would take to reach zero by 2035 instead of 2045. So things are changing very fast.</p>	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.</p>
M128	Noah Harris	Climate Action Campaign	<p>I am with Climate Action Campaign and a member of the San Diego Green New Deal Alliance calling to comment on SANDAG's Draft 2021 Regional Plan. We thank the staff and board for their work and our very encouraged by SANDAG's bold new direction to start the process of transforming the San Diego region's transportation system, so it is more sustainable, equitable, and climate safe. The most up-to-date climate science says that we must slash emissions towards zero carbon as soon as possible to stop the worst impacts of the climate crisis, which, as we've seen this summer, are worsening each year. Extreme heat, wildfires, drought, flooding, and more: these have and will disproportionately impact historically underinvested communities of concern.</p> <p>As such, we urge you to first exceed state mandated emissions reduction targets by maximizing mode shift towards bike, walk, and transit. We must get people out of their fossil fuel cars and into more</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT. The 5 Big Moves will enhance connectivity and result in people having more travel options and operating solutions, reducing per capita VMT. Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			sustainable modes of travel. Aggressive mode shift should be pursued in partnership with the cities, particularly the city of San Diego, to achieve the Climate Action Plan's ambitious mode shift targets.	
M129	Noah Harris	Climate Action Campaign	Second, investments should be prioritized in the communities on the front lines of the climate crisis and environmental justice: the communities with disconnected transit trips, dangerously polluted air, and lack of access to job centers.	The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. This list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.
M130	Noah Harris	Climate Action Campaign	Finally, we are in strong support of youth opportunity passes, no cost transit passes for youth 24 and under. This is an essential investment in our youth, and it should be included in Appendix A and implemented in partnership with MTS and NCTD as soon as possible in the early earliest implementation of the plan.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.
M131	Pamela Heatherington		I'll start with thanking everyone for your leadership and getting us this draft regional plan. But I want to start with the premise that the environment is the foundation for all living things. We owe it to future generations to secure a regional funding source to protect and manage a comprehensive habitat system. Our substantial acreage has been permanently conserved, additional acres must be acquired, and the conserved lands must be maintained and monitored to ensure that sensitive local plants and wildlife do not become extinct. As a critical partner, we ask SANDAG to continue to foster the effort to secure a regional funding source. Without a sustainable environment, all else is lost.	<p>As outlined in Appendix AA - Regional Habitat Conservation Vision of the 2021 Regional Plan, SANDAG identifies that a regional funding source is needed to implement regional habitat conservation plans to protect species and their habitats from extinction into the future. The Regional Habitat Conservation Vision identifies specific goals to Protect, Connect and Respect species and their habitats within our region.</p> <p>A steady, secure regional funding source is needed to complete the land acquisitions as proposed and to provide for ongoing land management. Acquisition of land has primarily been through state and federal funding leveraging offset from land development. As the land use patterns shift in the region toward more compact, urban development focused around urban Mobility Hubs, less greenfield development will occur, resulting in less development offsets. Similar state and federal funding are diminishing as more areas in California and the nation follow San Diego and adopt these habitat conservation plans. This will place increasing pressure on the region to complete the acquisition and management of natural lands without a dedicated funding source.</p> <p>While several barriers have been identified in implementing the vision for regional habitat conservation, the role of SANDAG as the regional planning agency and its commitment in its development of a Sustainable Communities Strategy will provide new opportunities to fulfill the promises made during the adoption of the region's various regional habitat conservation plans.</p>
M132	Rita Clement	SanDiego350	<p>I'm with San Diego 350, which is a member of the San Diego Green New Deal Alliance. I'm speaking because I wanted to thank the staff at SANDAG for their progress around transportation and this Regional Transportation Plan.</p> <p>However, this plan doesn't move quickly enough to meet the urgency of the climate crisis, and give those reliant on transit the relief they need. I traveled from my home in Chula Vista to Downtown San Diego for 12 years. I took two buses and then the H Street trolley. It took me an hour and a half to get there and two hours to come home. We need to accelerate the timeline for all transit: trolleys, buses, rail, and biking infrastructure improvements. And prioritize the environmental justice communities that need transit solutions the most. Environmental justice communities, who disproportionately suffer from the effects of climate change, cannot afford to wait. They need immediate improvements while the long-term infrastructure projects are being planned. This means no new roads and specifically accelerating the Purple Line and collaborating with MTS to improve the Blue Line that serves these communities. It also means transitioning to zero-emission vehicles.</p>	<p>The 2021 Regional Plan includes a Sustainable Communities Strategy (SCS), as required by California Senate Bill 375 (Steinberg, 2008) (SB 375), for the San Diego region. This SCS describes coordinated transportation and land use planning, and identifies Priorities for Adaptation Planning, which include serving as a resource for local agencies' Climate Action Planning efforts and the general public on the impacts of climate change. When combined with the transportation network, the SCS exceeds the state's target for reducing per capita GHG emissions set by the California Air Resources Board.</p> <p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
				<p>these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</p> <p>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</p> <p>The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p>
M133	Shayla Ott		<p>I'm a resident of North Park, San Diego. I wanted to thank you all for your effort drafting this plan and putting in the necessary steps to combat the climate crisis. I do want to ensure that the 2021 Regional Plan is as robust and comprehensive as possible for climate, jobs, and justice. As other folks have said today, the climate crisis is already here with what we are seeing with fires, flooding, storms, droughts, and record-breaking temperatures across the U.S. especially here in California. The worst impacts of the climate crisis already have and will continue to disproportionately impact low income communities and communities of color first and the longest. SANDAG must do its part to ensure that we reach zero-carbon as quickly as possible. And I recommend the following strategies, first exceed state-mandated emissions reductions; second, prioritize investments in bike, walk, and transit; and third, direct funding to historically underinvested communities of concern to bring about immediate transportation improvements in the neighborhoods on the front lines of environmental injustice. Please prioritize youth opportunity passes within the transit funding as an early action pilot program.</p>	<p>Many of the items in this list are included in the Regional Plan. SANDAG staff are also working with our Community Based Organizations to develop pilot projects that could lead to early implementation.</p>

### August 5, 2021 – SANDAG 2021 Regional Plan Social Equity Working Group Meeting

Comments below are summaries compiled by SANDAG staff based on discussion from several CBOs during the meeting; full approved meeting minutes are attached at the end of this document

M134	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 1. - 08.05.21 SE-WG Meeting - An Environmental Justice Centered RTP: Ensure the projects included in the 2021 Reprioritize environmental justice (EJ) communities as identified by CalEnviroScreen (CES) by listing the projects that will directly benefit EJ communities, outlining immediate benefits via projects that will be implemented by 2025 in EJ communities, and making all public communication easy to understand by the public in order to promote meaningful engagement. Status: We ask that an equity specific project list be included in Appendix A: Transportation Projects, Programs, and Phasing document.”</p>	<p>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.</p>
M135	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 2. - 08.05.21 SE-WG Meeting - Improve the Bus System Now (BCC, CF, NLRC, NSDI, VCC, EHC): Develop a bus system that is fast, frequent, reliable, and accessible by increasing frequency on popular lines, especially overcrowded ones. This should be done immediately as a way to introduce the public to a new transit era with short-term and long-term solutions. It should be done by providing MTS with the necessary financial support for implementation. EJ communities cannot afford to wait 10-20 years for solutions. We need immediate improvements while the big infrastructure projects are being planned. Status: We request more clarity in Appendix A: Transportation Projects, Programs, and Phasing that</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			provides a list of specific improvements to the bus system. Currently, the document only describes changes to bus frequency in planned key corridors. Bus improvements are one of the most affordable ways to immediately increase connectivity, reduce toxic air pollution and greenhouse gas (GHGs) emissions in the region.”	
M136	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 3. - 08.05.21 SE-WG Meeting - Blue Line Express (CHCDC, EHC): Fund the planning, environmental, engineering, and capital for the additional Blue Line track that allows express, 24-hour service, and additional frequency enhancements. Rail-grade separations should only move forward with the addition of a third track that eliminates conflict between the Blue Line and freight. The Blue Line is the backbone of our transit system. It has the highest ridership and is one of the best-performing transit lines in the San Diego region. However, it is overcrowded, has limited frequency, delayed connectivity, and no 24-hour service.</p> <p>Status: The information listed needs to be clarified. It is unclear if the double/third tracking included in Appendix A refers to an additional track that will provide express connectivity from the border to downtown San Diego.”</p>	The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.
M137	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 4. - 08.05.21 SE-WG Meeting - 24-Hour Service by 2025 (BCC, CHCDC, NSDI, OWG, EHC): Provide 24-hour service on popular transit routes to connect late-night and early morning workers to their jobs by 2025. Participants of the Elevate SD 2020 community engagement efforts ranked this as their highest priority.</p> <p>Status: The information listed needs to be clarified. Appendix A includes local bus route enhanced frequencies to ten minutes in key corridors but does not state if that would result in 24-hour service. Simultaneously, Chapter 2 includes all-day services from 20-22 hours per day for rail and rapids, but it excludes local bus routes and a clear implementation schedule.”</p>	The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.
M138	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 5. - 08.05.21 SE-WG Meeting - Purple Line Serves (CHCDC, SHC, EHC): Central City Heights: Fund the planning, environmental, engineering, and capital for the Purple Line as a rail line that connects EJ communities in central City Heights and South Bay to Sorrento Valley.</p> <p>Status: According to the SANDAG staff, the alignment includes central City Heights in the 2050 RTP with a 2035 implementation. However, it should be listed in the document, demonstrate that the project phasing prioritizes central City Heights and the South Bay region, and a 2035 project completion.”</p>	The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.
M139	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 6. - 08.05.21 SE-WG Meeting - Youth Opportunity Passes (YOP)(CF, CVCDC, ECC, NLRC, UCP, VCC): Provide no-cost transit passes for all youth 24 years old and under in order to ensure generations of lifelong transit riders and encourage significant mode shift. Connect youth to school, work, internships, and other early-career opportunities.</p> <p>Status: We ask that it be accelerated for a 2023 implementation rather than the current delayed plan to implement in 2027.”</p>	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth 18 and under.
M140	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>Lifeline 7. - 08.05.21 SE-WG Meeting - Electrify Bus Fleet by 2030 (EHC, UCP, NLRC): Fund the implementation of California’s Innovative Clean Transit rule to accelerate the electrification of the bus fleet ten years before mandated by the California Air Resources Board. We cannot afford to wait 20 years to reduce GHGs.</p> <p>Status: We ask that the transition to zero-emission buses be accelerated for a 2030 completion with the support of recently approved state and federal funding sources. In addition, all the rapid bus route expansions listed should be implemented with ZEBs. According to Appendix A, the plan includes \$75 million for zero-emission buses and infrastructure by 2025 and \$250 million by 2035.</p>	The proposed final 2021 Regional Plan supports the electrification of the region’s transit buses and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a> .
M141	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 8. - 08.05.21 SE-WG Meeting - Identify Anti-Displacement strategies (CHCDC, NSDI, VCC): Fund anti-displacement efforts to protect vulnerable communities living near transit corridors by developing an anti-displacement strategy that includes affordable/low-income housing and preservation of naturally occurring existing affordable housing, community ownership, and tenant protections.</p>	SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resiliency, consistency with the transportation improvements included in the Regional Plan, and alignment with other SANDAG grant programs. Additionally, SANDAG will

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
			Status: SANDAG staff has expressed interest in an anti-displacement study. We request an update on the status of the anti-displacement study. “	coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.
M142	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 9. - 08.05.21 SE-WG Meeting - Bathroom network (CF, EHC): Develop a bathroom access plan and provide MTS with funding for a clean and accessible bathroom network open at all major transit stations. And a bathroom at the San Ysidro port of entry.</p> <p>Status: It is unclear if a bathroom network is included in the capital operations budgets. The 2021 Regional Plan states that “mobility needs to be widely accessible, affordable, easy to use, and tailored to a person’s individual needs. In short, mobility must be viewed as a basic human right”. State-of-the-art bathrooms are mobility and key to a successful transit system.”</p>	The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.
M143	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Lifeline 10. - 08.05.21 SE-WG Meeting - Emergency Ready Transit System (EHC, NLRC): Fund the planning and implementation of a transit emergency response strategy to provide safety particularly to EJ communities during community-wide emergencies. EJ residents are more likely to live in proximity to hazardous land uses that frequently result in fires and neighborhood emergencies. Simultaneously, frontline communities are also most vulnerable in the face of climate disasters. Status: Not included in the RTP.”</p>	MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.
M144	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Addendum 1 - 08.05.21 SE-WG Meeting (BCC, CF, CHCDC, ECC, OWG, SHC, UCP): SE-WG request improvements to transit stop, which includes items such as benches, bus shelters, and bike racks. Shelters should also include lighting and protection from the elements such as sun and rain.”</p>	MTS and NCTD currently provide shelters wherever it is physically feasible. As part of larger infrastructure projects like Next Generation Rapid, Trolley and Commuter Rail, all stations will have shelters.
M145	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>Addendum 2 - 08.05.21 SE-WG Meeting (ARS, ECC, NLRC, OWG): The SE-WG requests a prioritization of flexible fleets. Communities outside of the urban center such as North County, South Bay, and East County, especially need access to flexible fleets. In less urbanized regions, and regions with higher vulnerable populations, flexible fleets can connect populations into the transit system.</p>	SANDAG will also be conducting pilot programs for the implementation of Flexible Fleets and other micro-mobility options to help connect people in less dense regions into the greater transit network. Information regarding Flexible Fleets can be found in Appendix A and N. Additional materials can be found at: <a href="https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdfrpvisionfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f865_2">https://sdforward.com/docs/default-source/2021-regional-plan/5039-sdfrpvisionfivebigmovesonesheets-flexible-fleets-june2019_final.pdf?sfvrsn=79d3f865_2</a> .
M146	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>Addendum 3 - 08.05.21 SE-WG Meeting (ECC, OWG (2), UCP): SE-WG requests a prioritization of pedestrian and bicycle infrastructure be implemented into the 2021 Regional Plan, with a focus on social equity communities.</p>	<p>As an early action of the Regional Plan, SANDAG will be developing a new Active Transportation Plan. The plan will take a fresh look at the network and the options to make it safe and comfortable to use active transportation. SANDAG prioritizes community engagement and will develop these connections in partnership with the community so that we can make sure the routes take people where they want to go.</p> <p>As each of these transportation projects moves forward there will be a great deal of planning, engineering, and design work ahead of the project’s construction. In the future there are opportunities for bike, pedestrian, and neighborhood safety projects in conjunction with the RTP’s transportation projects. The Current Community Planning Projects are a good example and we strongly encourage you to be involved in the South Bay to Sorrento project. See more info here: <a href="https://www.sandag.org/index.asp?subclassid=83&amp;fuseaction=home.subclasshome">https://www.sandag.org/index.asp?subclassid=83&amp;fuseaction=home.subclasshome</a>.</p>
M147	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Addendum 4 - 08.05.21 SE-WG Meeting (ARS, NLRC (3), BCC, VCC): SE-WG requests that the 2021 Regional Plan includes considerations for special transit connections. Specifically connections in North County to Orange County and Southern Riverside County, East to West Sprinter Connections, and Temecula to Border connection. “</p>	Regional connections are provided in the plan connecting Orange County to San Diego at the Oceanside Transit station. The Sprinter line is also planned for upgrades. Additional regional connections will be assessed in the 2025 Regional Plan.
M148	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>Addendum 5 - 08.05.21 SE-WG Meeting: All CBOs of the SE-WG, broadly expressed an interest in SANDAG pursuing pilot programs and fund for early implementation of the various strategies expressed in the 2021 Regional Plan.</p>	SANDAG is working directly with the CBO’s on transit pilots that could be adopted earlier than what this is identified in the plan. SANDAG will continue to seek opportunities to implement projects early as funding becomes available.
M149	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>“Addendum 6 - 08.05.21 SE-WG Meeting (BCC, OWG, SHC): SE-WG request that free senior passes be included as part of the 2021 Regional Plan especially in our low income communities with disproportionately elderly populations such as Chula Vista, National City, and South East San Diego. “</p>	One of the plan’s near-term Implementation Actions listed in Appendix B will be a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth.

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

ID	Commentor Name	Agency	Comment	Response
				In Appendix U: Cost Estimation Methodology, Table U.2 captures the transit fare subsidies to riders throughout FY2026-FY2050. For more information on the Value Pricing and User Fee Implementation and the Regional Fare Impact Study, please see Appendices B and U.
M150	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	“Addendum 7 - 08.05.21 SE-WG Meeting (CHCDC, OWG, UCP): SE-WG requests that transit outreach and a transit education campaign be implemented into the 2021 Regional Plan. Community members are unaware of how to utilize the transit systems of San Diego. “	SANDAG is actively working on developing an outreach program for all roadway users focused on the projects being constructed in the Regional Bike Early Action Program. We have received a \$1.9 million competitive State Active Transportation grant to develop and implement an education and outreach program that is beginning soon. Additionally, staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. Included in this pilot will be an education component, asking CBO partners to help get the word out on public transit benefits.
M151	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	Addendum 8 - 08.05.21 SE-WG Meeting (ECC, OWG, VCC): SE-WG request that transit security be implemented into the 2021 Regional Plan. Especially in El Cajon, National City and Vista.	SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.
M152	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	“Addendum 9 - 08.05.21 SE-WG Meeting (BCC, CHCDC): SE-WG requests that access to the beach be implemented into the 2021 Regional Plan. Many community members from disenfranchised backgrounds lack access to the beach. Transit riders have prohibitively long rides to access the beach and other San Diego waterfronts. “	The transit network that has been developed for the Regional Plan includes faster access to the beach. There are Rapid and Commuter Rail routes that will operate between Mid-City and the proposed Central Mobility Hub. From that location you can seamlessly transfer to routes that will take you to Ocean Beach, Pacific Beach and La Jolla.
M153	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	Addendum 10 - 08.05.21 SE-WG Meeting (ECC, NSDI, OWG): SE-WG Requests that multilingual language materials and signage be implemented into the 2021 Regional Plan. The San Diego region currently has large Spanish-only and Arabic-only speaking residents. The language barriers these residents experience on a daily basis, is only further exacerbated by a lack of multilingual signage and informational materials. Furthermore, a lack of adequate language materials only further alienates these populations, excludes them from job markets, and excludes them from utilizing our transit systems.	SANDAG will be applying a social equity planning framework throughout the implementation of the Regional Plan. Through this framework, one of the Regional Plan's near-term actions includes developing a Digital Equity Strategy and Action Plan that will address regional accessibility gaps in communications infrastructure, technology, and digital literacy. Within digital equity, we have been working with our Community-Based Organization partners (or CBOs) to ensure that language translations and educational resources on transit are available to all San Diegans as we advance with our next OS system. Additionally, one of the points our CBO Partners have emphasized in our outreach is addressing the accessibility of existing infrastructures like multilingual language materials and signage for our current transportation system, which will be an essential to our early-action plans.  For more information, I would like to refer you to Appendix B: Implementation Actions, Table B.1 on the Digital Equity Strategy and Action Plan. For more information on our community-based outreach please see Appendix H: Social Equity: Engagement and Analysis.
M154	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	Addendum 11 - 08.05.21 SE-WG Meeting (OWG, VCC): The transit fare of the San Diego regional are still prohibitively expensive for our low income riders. The SE-WG implores SANDAG to explore avenues to make transit more affordable and even free for certain areas or segments of the population. The SE-WG requests that these considerations be included in the 2021 Regional Plan. Examples to consider include LA Metro with single fares of \$1.75, LA Go (County Bus) with \$14/30 day senior passes.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth 18 and under.
M155	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	Addendum 12 - 08.05.21 SE-WG Meeting (UCP , CF, EHC, ECC): For decades, San Diego has implemented housing without consideration of the transportation needs of the residents that will inhabit those housing units, and without consideration of the greater impact to the transportation network as a whole. The SE-WG requests that SANDAG consider the implementation of housing near transit stations, especial in National City and El Cajon, and the implementation of Mobility Hubs in City Heights, Euclid & Market, and San Ysidro.	SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with other SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.
M156	SANDAG Social Equity Working Group Members	SANDAG Social Equity	Addendum 13 - 08.05.21 SE-WG Meeting (UCP): High-speed fiber optic internet access has become more vital for our region, and an increasingly more integrated part of our transportation systems and infrastructure. Certain communities and	The transportation system envisioned in the 2021 Regional Plan relies on a vast network of digital infrastructure to connect and manage the transportation system. For Complete Corridors, NextOS, Flexible Fleets, Transit Leap, and Mobility Hubs to succeed, a robust

## Draft 2021 Regional Plan Responses to Comments – Public Meeting Sourced

		Working Group	populations have not benefited from this emerging technology and are a risk of being left behind. NextOS is a major component of the 2021 Regional Plan, and to deter inequity from emerging, the SE-WG requests that SANDAG include language that describes a more equitable access to this emerging technology. The SE-WG acknowledges that fiber optic internet will be an integrated and inseparable part of public transportation and infrastructure; and the SE-WG requests that SANDAG amends the 2021 Regional Plan to better address this inequity.	broadband and telecommunications network is essential. The Plan includes an investment in the backbone fiber infrastructure needed to support the transportation network however SANDAG is also developing a Regional Digital Equity Strategy & Action Plan to support the expansion of broadband county-wide. The Strategy & Action Plan will define strategies for expanding broadband and internet connectivity in the San Diego region to support quality of life, transportation, and equity.
M157	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	“Addendum 14 - 08.05.21 SE-WG Meeting (VCC): Communities in the North County are experiencing an elimination of transit routes without replacement. SE-WG requests that SANDAG give special consideration to deter the elimination of such routes.”	Transit service planning changes are guided by SANDAG's Policy 18 which outlines the requirements for service changes and transit agency and SANDAG responsibilities with regard to those service changes. These include steps to be taken with regard to, but not limited to, social equity analysis and outreach. More information can be found here: <a href="https://www.sandag.org/organization/about/pubs/policy_018.pdf">https://www.sandag.org/organization/about/pubs/policy_018.pdf</a> .
M158	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	Addendum 15 - 08.05.21 SE-WG Meeting (VCC): The presence of ICE and Border Patrol officers at transit is a deterrent to ridership and participation in our transit system. SE-WG implores SANDAG to work with its partners to eliminate the presence of such officers at transit centers and transit stations, and to include such language in the 2021 Regional Plan.	<p>Transit station security and operations are a function of MTS and NCTD. MTS's website states that they have been making changes to its security policies and practices, to ensure their operations are in line with best in practice policies. Recent measures include increased training for internal and contract security staff, updated use of force policy, conducting an outside audit, using more visible and customer friendly uniforms, and more. Details can be found at <a href="https://www.sdmts.com/inside-mts/news-release/mts-makes-significant-changes-use-force-policy">https://www.sdmts.com/inside-mts/news-release/mts-makes-significant-changes-use-force-policy</a> and <a href="https://www.sdmts.com/inside-mts/news-release/new-uniforms-mts-security-teams-aim-increase-trust-and-public-safety">https://www.sdmts.com/inside-mts/news-release/new-uniforms-mts-security-teams-aim-increase-trust-and-public-safety</a>.</p> <p>NCTD's website states that they contract with the San Diego Sheriff's Office and local law enforcement agencies to patrol and provide law enforcement and security services at our transit centers. Your comment was shared with Dennis Desmond (denis.desmond@sdmts.com) and Robert Calix (rcalix@nctd.org) from MTS and NCTD respectively.</p> <p>SANDAG's Public Safety Committee provides a forum for which regional public safety issues and concerns can be addressed. NCTD and MTS serve on the Public Safety Committee as advisory members. Information regarding the Public Safety Committee can be found at: <a href="https://www.sandag.org/index.asp?committeeid=66&amp;fuseaction=committees.detail">https://www.sandag.org/index.asp?committeeid=66&amp;fuseaction=committees.detail</a>.</p>
M159	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	“Addendum 16 - 08.05.21 SE-WG Meeting (VCC): SE-WG requests that trash cans be included at all transit stops and transit stations, and that the 2021 Regional Plan be amended to reflect this language. “	The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. Improving these facilities would also include trash cans at transit stops and transit stations to ensure cleanliness and safety.
M160	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	“Addendum 17 - 08.05.21 SE-WG Meeting (VCC): SE-WG wants reassurance and accountability from SANDAG that it will follow through on the requests and recommendations made by the Social Equity working group, as described in Item 5 of the August 5th, 2021 Social Equity working group meeting, entitled The Ten Transit Lifelines and all other subsequent language attached to the aforementioned Item 5 or Ten Transit Lifelines.”	SANDAG has provided a response to each request and recommendation made by the Social Equity Working Group regarding the Ten Transit Lifelines and all other subsequent language attached to the Ten Transit Lifelines. SANDAG looks forward to continuing to partner with the Social Equity Working Group on implementation of the 2021 Regional Plan.
M161	SANDAG Social Equity Working Group Members	SANDAG Social Equity Working Group	<p>***10 Transit Lifelines - Closing Language***</p> <p>EJ communities are at the frontlines of toxic air pollution and the nearing climate disaster. The RTP is the region's biggest opportunity to dramatically address the course of climate change in the region. According to SANDAG, transportation represents 41% of the region's GHG emissions and only 7% of low-income residents have access to fast and frequent transit. Simultaneously, San Diego has the seventh-worst ozone pollution in the U.S, and EJ communities are disproportionately impacted. Inadequate investment in the mass transit system harms our most vulnerable communities' health and quality of life.</p> <p>The RTP should include assertive and prompt policy solutions by 2025 because the climate emergency is here. The RTP is a visionary document by nature, however, it must outline immediate benefits to improve the region's economy, quality of life and sharply reduce air pollution and GHGs in EJ communities. Communities that suffer the brunt of environmental harm cannot wait any longer for prompt relief.</p>	<p>SANDAG recognizes the urgent need for reduction of GHG emissions, especially in our most marginalized communities, as a key aspect in an equitable and sustainable future for the region. Attachment 2 of Appendix A includes a list of transportation projects aimed to reduce pollution exposure in our region's disadvantaged communities in accordance to AB805 and CalEnviroScreen 3.0.</p> <p>SANDAG will be implementing a social equity planning framework throughout the entirety of the Regional Plan. For more information on how the plan will benefit our region's most underserved communities, please refer to Appendix H to find comparative analyses of projected social equity performance measure outcomes (such as PM2.5 emissions exposures) through Build vs. No-Build scenarios.</p>

September 23, 2021

Action: **Approve**

### **August 5, 2021, Meeting Minutes**

Chair Vivian Moreno (SANDAG Board Alternate) called the meeting of the 2021 Regional Plan Social Equity Working Group to order at 10:01 a.m.

#### **1. Welcome and Introductions**

Chair Moreno welcomed the Working Group members.

#### **2. Public Comments/Communications/Member Comments**

Randy Torres-Van Vleck, City Heights Community Development Corporation, spoke about the Metropolitan Transit System (MTS) Trolley 40th Anniversary celebration held on Saturday, July 31, 2021, and acknowledged that it was a great event. Randy Torres-Van Vleck announced that MTS is changing their fare system from MTS Compass to PRONTO.

Brian "Barry" Pollard, Urban Collaborative Project, spoke about the success of the MTS Trolley 40th Anniversary celebration. Brian Pollard acknowledged MTS for the outreach efforts with members of the public living in the San Diego region, free Trolley and bus ridership during the month of August, and to contact him or Randy Torres-Van Vleck for additional information on PRONTO cards.

Robin Joy Maxson, Ramona Community Planning Group and member of the public, spoke about the Latino population of Ramona, a geographical area currently not being represented, and expressed wanting to join the Working Group.

#### **3. Approval of Meeting Minutes (Approve)**

Action: Upon a motion by Brian "Barry" Pollard and a second by Carol Lewis (El Cajon Collaborative), the Working Group approved the minutes with corrections made from its July 22, 2021, meeting.

The motion passed.

Yes: Craig Jones (Alliance for Regional Solutions), Rose Ceballos (Bayside Community Clinic), Lisa Cuestas (Casa Familiar), Randy Torres-Van Vleck (City Heights Community Development Corporation), Brendaly Rodriguez (Chula Vista Community Collaborative), Carol Lewis, Konane Martinez (National Latino Research Center), Breanne Lash (Nile Sisters Development Initiative), Claire Groebner (Olivewood Gardens), Fe Seligman (Samahan Health Centers), Brian "Barry" Pollard, and Erica Leary (Vista Community Clinic).

No: None.

Abstain: None.

Absent: None.

Mohammed Tuama, Nile Sisters Development Initiative, spoke about language barriers and inaccurate translation on public transit flyers and videos. And suggested SANDAG provide outreach efforts on how to ride public transit to the community in various languages.

Rocina Lizarraga, Olivewood Gardens, spoke about the concerns affecting residents in community like limited transportation for senior citizens, unfinished bike lane connectivity, safety for bike riders and pedestrians, and the development of a bus system that is affordable, frequent, and reliable. Ms. Lizarraga also spoke in support of addressing the homelessness issue in National residents do not feel safe walking in their community.

Fe Seligman, Samahan Health Centers, spoke about having a micro-level analysis on social benefits for low-income community from proper infrastructure of purple line serving Central City Heights and South Bay to Sorrento Valley, fund the planning, environmental, engineering and improvements for proper bus stops.

Brian "Barry" Pollard, Urban Collaborative Project, spoke in support of a transit hub at Euclid Avenue and Market Street, having a tremendous amount of need of a transportation center located in the area. The Orange Line Trolley needs numerous calming crossing improvements, installing electric buses to help eliminate pollution in community, emphasized how education is *vital* among all transportation groups and how community-driven process for all under-served communities is important. Increasing the marketing budget analysis was discussed.

Erica Leary, Vista Community Clinic, spoke in support of developing a safe bus system that is sheltered for users - students and additional frequency enhancements, the 10 Transit Lifelines, provide YOP and savings in general, completing the managed lane on 78, and fund anti-displacement efforts to protect North County residents.

Craig Lewis, spoke in support of comments made by Konane Martinez and Erica Leary on observations made relative to North County on an alternative travel time on the Sprinter, and fund the implementation of next generation rapid going east and west between Oceanside and Escondido (see reduction of travel to ½ hr.).

Carmela Munoz, Vista Community Clinic, spoke in support of improving frequency of the Sprinter and accomplishing the rapid bus route expansions project before 2023, by providing an accelerated implementation to the North County Mall in Escondido.

Randy Torres-Van Vleck, Community Development Corporation, spoke in support of all the regional priorities shared by the CBO communities and summarized a brief description of implementing an equitable, efficient, and affordable transit system, having equitable access to the beach, fund an anti-displacement strategy to protect vulnerable communities in the San Diego region.

Carolina Martinez, Environment Health Coalition, San Diego Transportation Equity Working Group, provided a summary of the collective and collaboration on the 10 Transit Lifelines and spoke in support of Item 5. Congratulated the CBOs for participating in the San Diego Transportation Equity Working Group they represent.

Ghina M. Yamout, Marrs Services Inc., member of the public, expressed interest in being an advocate on areas of green infrastructure, areas of low-income residents, improving water quality and asked SANDAG to incorporate green infrastructure for best transit in the Equity Plan.

Maritza Garcia, member of the public, spoke in support of incorporating an electric bus fleet system to help reduce pollution that affects residents and incorporate transit lifelines.

Jose Franco Garcia, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines and provided a brief testimony of the community feedback in developing a bus system that is safe, reliable, and holistic to make a great transit plan for the San Diego region. SANDAG needs to develop an anti-displacement plan.

Allie Fen, Community Organizer, Environmental Health Coalition, spoke in support of funding for restroom access in public transit stations, and the 10 Transit Lifelines.

Sally Smull, member of the public, spoke in support of the 10 Transit Lifelines, Trolley crossing issues, the desperate need for YOP, seven-day a week bus service, trees and benches needed in all public bus stops in the area. And thanked everyone for their time and energy in working on this important process.

Nancy Cruz, member of the public, spoke in support of the 10 Transit Lifelines, transit initiatives that allow for investing in public transportation, improve commute times and environment in her community.

Laura Benavidez, City Heights Community Organizer, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines and her experience as a community organizer, and the community-driven process with the SDTEWG.

Esperanza Gonzalez, Community Organizer, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines and to prioritize funding to provide 24-hour bus service to working residents in the City Heights community. Mrs. Gonzalez depends on public transportation to move around the region.

Jack Shu, Councilmember City of San Diego, thanked everyone for their comments, participation in advocating for equity, environmental justice, and to think big and encouraged to move forward with this plan.

Maria Magdalena Cerda Baez, Border Environmental Justice Policy Advocate, Environmental Health Coalition, spoke in support of increasing transportation services in Imperial Beach for youth attending college and universities in the region. Maria Baez shared personal experiences her children endured while attending college from Imperial Beach.

Nicole Burgess, Board Member of Walk San Diego, commended everyone in this group and spoke in support of equity and environmental justice, the YOP, providing 24-hour bus service, transit to integrate mini mobility hubs – bike shares for all San Diegans and add to the RTP.

Karla Montevisa, member of the public, spoke in support of developing a bus system that is frequent and reliable for her community.

Roddy Jerome, Community Member, Environmental Health Coalition, spoke in support of the 10 Transit Lifelines.

Konane Martinez, National Latino Research Center, spoke about an official key aspect provided by the community making the County of San Diego and SANDAG accountable to the feedback received by the working groups and community by providing them with an update on changes.

Action: Upon a motion by Lisa Cuestas and a second by Craig Jones, the Working Group recommended that the Board of Directors approve support of the 10 Transit Lifelines and all of the other recommendations from the Working Group to be integrated into in the 2021 Regional Plan.

The motion passed.

Yes: Craig Jones, Rose Ceballos, Lisa Cuestas, Randy Torres-Van Vleck, Brendaly Rodriguez, Carol Lewis, Konane Martinez, Breanne Lash, Claire Groebner, Fe Seligman, Brian "Barry" Pollard, and Erica Leary.

No: None.

Abstain: None.

Absent: None.

**6. Transit Equity Early Action Budget Amendment Update (Discussion)**

This item was postponed to a future meeting.

**7. Possible Topics for Next Meeting (Discussion/Possible Action)**

Chair Moreno asked the Working Group to discuss possible topics for the next meeting.

Action: Discussion

**8. Upcoming Meetings (Information)**

The next Working Group meeting is scheduled for Thursday, September 23, 2021, at 10 a.m.

**9. Adjournment**

Chair Moreno adjourned the meeting at 11:54 a.m.

## Confirmed Attendance at SANDAG 2021 Regional Plan Social Equity Working Group Meeting

August 5, 2021

Organization	Name	Attended	Comments
SANDAG Board Alternate	Councilmember Vivian Moreno, Chair	Yes	
Alliance for Regional Solutions	Craig Jones	Yes	
	MaryLynn McCorkle, Alternate	No	
Bayside Community Clinic	Kim Heinle	No	
	Rose Ceballos, Alternate	Yes

# Appendix G Attachment 7E: Letter-Sourced Public Comments and Responses

The table below contains all comments on the draft 2021 Regional Plan provided to SANDAG in letters during the public comment period. Full copies of the letters received are included at the end of this attachment.

The comments and responses are organized alphabetically by the commentor or commenting agency/organization.

Table G7E: Draft 2021 Regional Plan Responses to Comments – Letter Sourced

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

L1	<p>We are excited for the future of transportation in our region. The 2021 Regional Plan includes visionary elements to building an efficient, accessible, and sustainable transportation system. Thank you for everyone’s effort on it. However, we bring to your attention that a key program is missing. We request that you amend the draft 2021 Regional Plan to include Youth Opportunity Passes (YOP), no-cost transit passes for youth ages 24 and under.</p> <p>For 10 years, the Improving Transportation in City Heights Team (ITCH) has advocated to have no-cost transit passes for youth in San Diego. Mid-City CAN, the ITCH team, and the undersigned supporters request that you include YOP (ages 24 &amp; under) in the 2021 Regional Plan. YOP requires a spot among to priorities in our 30-year vision for transportation in the region.</p> <p>We ask the Board of Directors to take the following actions:</p> <ol style="list-style-type: none"> <li>1. Amend the 2021 Regional Plan to state that Youth Opportunity Passes, no-cost-transit passes for youth ages 24 and under, will be funded when transit subsidies are allocated.</li> <li>2. Amend the 2021 Regional Plan to state that transit subsidies will be allocated at the earliest implementation possible.</li> <li>3. Fund Youth Opportunity Passes (24 &amp; under) as an early-action Transit Pilot Program this year. YOP (24 &amp; under) is a necessary program, as illustrated by the following facts: <ul style="list-style-type: none"> <li>1. Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic. In San Diego County, there are approximately 86,000 young workers (ages 16-24) who work in the industries that were hard hit by the COVID-19 epidemic.<sup>1</sup> The industries include hospitality, food services, retail, oil and gas mining, transportation, employment services, travel, and leisure.</li> <li>2. YOP (24 &amp; under) is a way to increase ridership and develop a transit-culture. Only 10,463 youth (ages 16-24) use public transit in San Diego, but these young commuters use public transit at a rate double that of their older counter parts (adults ages 25-59). YOP will further promote transit use among young San Diegans.</li> <li>3. YOP (24 &amp; under) helps divert youth away from the school to prison pipeline. MTS officers decide who to check for fare evasion, YOP prevents the criminalization of youth of color due to their inability to afford a pass. Literature suggests that Black youth are arrested for fare evasion at a rate 5 times higher than their white peers and Latino/a/x youth are arrested at a rate 4 times higher than their white peers.</li> <li>4. YOP (24 &amp; under) promotes the reductions of GHGs. A person who switches from a 20-mile round-trip commute by car to using existing public transit, can reduce his or her annual CO2 emissions by 4,800 pounds per year.<sup>5</sup> Decreasing greenhouse gas emissions is a matter of equity. Residents in low-income, BIPOC communities are exposed to more pollution than their more affluent counterparts. For example, City Heights residents are exposed to twice the amount of diesel particulate matter from trucks &amp; cars than La Jolla residents.</li> </ul> </li> </ol>	<p>One of the Implementation Actions listed in Appendix B is a Regional Transit Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>SANDAG looks forward to partnering with the “Improving Transportation in City Heights” team in implementing the 2021 Regional Plan, including Youth Opportunity Passes.</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>5. YOP (24 &amp; under) addresses climate justice. Mid-City CAN has conducted 250+ conversations with residents in Communities of Concern (CoC). Over 86% of residents noted that climate change directly impacted them. Extreme weather has become a barrier to work and school for CoC residents who already face significant barriers to education and employment. Residents who normally walk or bike to work must increasingly rely on cars or public transportation that is inaccessible due to cost or distance. YOP eliminates the cost barrier to transportation for youth ages 24 and under.</p> <p>6. YOP (24 &amp; under) is a proven program. Similar programs exist in Alameda County, Los Angeles, Sacramento, San Francisco, and Santa Ana. Youth Opportunity Passes helps ensure youth from all background are connected to their schools, internships, medical care, and early-career opportunities.</p>	
<b>Andrew Puls</b>		
L2	<p>My wife and I have been Logan Heights residents for approximately five years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego's Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan (Draft Plan).</p> <p>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</p> <p>As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.</p> <p>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:</p> <p>The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)</p> <p>Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</p> <p>Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)</p> <p>Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.</p>	<p>Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
<b>AVAD Investments Inc.</b>		
L3	1. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles, and Vehicles. The Home/ Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94 - Martin Luther King Freeway.	1. While Home Avenue is not on the Adopted Regional Bike Network, the 2021 Regional Plan includes the nearby and parallel Chollas Creek Bikeways: North Fork - Bayshore Bikeway to University Bikeway and South Fork - Petway Park to Market Creek Plaza which will improve the connections described in this comment. The project alignment and details can specifically be found in the updated data viewer and Appendix A.. Your comment was forwarded to the City of San Diego.
L4	2. Completion of the Transportation markings along Home Avenue . Curbs are not marked for safety, to promote proper parking, traffic movement, and access for Buses and the Disabled. The Bicycle route is not fully painted and warning ramps for the visually impaired are not in place. Bulbing out at key intersections should be funded to increase pedestrian crossing safety.	2. Home Avenue is not in the Adopted Regional Bike Network. The City of San Diego and Metropolitan Transit System are the implementing agencies for these improvements. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is in development and provides another opportunity to provide input on transportation solutions for this area.  Your comment was forwarded to the City of San Diego.
L5	I believe that the business community, along Fairmount and Home Avenues, would be open to establishment of a Business Improvement and Maintenance Area to assist in cooperative funding of some of these improvements. We would appreciate assistance in establishing such special districts.	Establishing special districts is under the purview of the City of San Diego.  Your comment was forwarded to the City of San Diego.
<b>California Air Resources Board</b>		
L6	As part of CARB's SCS Policy Commitments evaluation, CARB staff will also need to consider whether and to what extent these actions advance the region's land use vision. To support this analysis, CARB staff request that SANDAG provide information that summarizes differences between existing residential and commercial density and type assumptions in its Mobility Hub areas, compared to what is currently allowable in local land use plans for the corresponding geographies as part of its final SCS Submittal.	SANDAG will provide requested information on residential and commercial density in Mobility Hubs as part of its final SCS Submittal to CARB.
L7	CARB staff notes that the draft RTP/SCS plans for a regionwide road user charge to be operational and generating revenue in the region starting as soon as 2026. CARB staff recognizes both the importance of, and difficulty in, implementing this pricing strategy. While the draft RTP/SCS includes actions committed to support implementation of this strategy (e.g., partnering on pilots, pursuing legislation, and investing in studies), which we support, they appear to be similar to those being pursued by other regions around the state that are assuming operations starting no sooner than 2030. CARB staff requests further clarification from SANDAG on how it may be able to implement sooner than others around the state as part of its final SCS Submittal.	In the proposed final 2021 Regional Plan, the road usage charge would begin in 2030 to align with efforts at the state and other regions.
L8	The draft RTP/SCS identifies that \$29 billion needs to come from new funding sources in order to implement the plan through 2035.3 Of those new funding sources, about \$18 billion, or 25 percent of the plan's total funding need through 2035, is attributed to new pricing strategies including Ridehailing Company Service Fees, Future State Revenues for Transportation, Regional Road User Charge, and Future Federal Revenues for Transportation. CARB staff is concerned that other strategies that contribute to the SCS meeting its targets may be at risk if the region is not able to fully secure these new funding sources within the timeline assumed in the draft RTP/SCS. CARB's evaluation will look at the extent to which the RTP/SCS strategies will be supported by existing revenue sources, as one measure of likely implementation. CARB requests that SANDAG identify whether and to what extent the high- impact strategies for achieving the GHG reduction targets in the plan are reliant on new revenue sources versus existing revenue sources as part of its final SCS Submittal.	In Appendix V: Funding and Revenues, Table V.2 includes a summary of availability assumptions and risk assessment for each new revenue source. SANDAG will coordinate with CARB staff if additional information is required as part of its final SCS Submittal.
L9	CARB staff reviewed Appendix A of the draft RTP/SCS and appreciate the detail provided on the region's transportation project investments by corridor. CARB staff is encouraged to see that the draft RTP/SCS includes planned investments across modes within the region's key corridors and that when investing in roadway projects, the region is prioritizing conversion of existing free-flow lanes into managed lanes with priority access for transit, carpool, and vanpool users, and fee access for single-occupant drivers. CARB staff observe that the plan also includes some managed lane projects whose scope includes adding new lanes. Specific to those projects, CARB staff requests that SANDAG provide further information that contextualizes the risk, if any, to the region's ability to achieve, and maintain its 2020 and 2035 GHG targets when adding new lanes in those locations (e.g., clarifying whether and how those projects align with and facilitate the region's preferred land use pattern, identifying whether other policies or mechanisms that will limit adverse passenger vehicle GHG/VMT emissions impacts are present in those locations) as part of its final Submittal.	In its final SCS Submittal, SANDAG will provide additional information on the managed lane projects whose scope includes adding new lanes. All managed lane projects were identified as part of the Complete Corridors concept, which also includes technology-driven solutions to manage demand, support the deployment of RAPID bus and Flexible Fleet services, and align with the Mobility Hub areas. As this comment notes, the 2021 Regional Plan proposes a conversion of general purpose lanes to managed lanes where possible to implement the managed lane system.
<b>California Coastal Commission</b>		
L10	As an initial and overall comment, we want to applaud this document and the important direction it sets on multiple policy issues. Coastal Commission staff specifically appreciate the acknowledgement that bold changes to San Diego's	SANDAG looks forward to partnering with the Coastal Commission on implementation of the 2021 Regional Plan.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>regional transportation network and compelling alternatives to driving alone are needed to meet greenhouse gas (GHG) emission targets. The Regional Plan will provide a key blueprint for reducing transportation air pollution and greenhouse gas emissions (GHGs), minimizing vehicle miles traveled (VMT), improving multi-modal transportation, addressing the need for greater equity in transportation systems, and enhancing the resiliency of our transportation network in the face of climate change, particularly with respect to sea level rise and our coastal highways. We primarily want to offer ourselves as a partner in this important work to carry forward the Regional Plan. In this letter, Commission staff would like to offer a few broad comments on how the Regional Plan could be modified to strengthen its consistency with the California Coastal Act.</p>	
L11	<p>Overall, the policies of the California Coastal Act that guide our work at the Coastal Commission significantly overlap with the goals of SANDAG’s Regional Plan, including policies to protect marine and coastal land habitats, concentrate urban development, maximize public access and expand multi- modal transportation, reduce VMT, and improve coastal resiliency to sea level rise and other climate- change hazards. For example, Appendix B: Implementation Actions identifies eight 2035 goals drawn from the Regional Climate Action Planning Framework which generally align with the referenced Coastal Act policies:</p> <ul style="list-style-type: none"> <li>• “High density, transit-oriented housing” aligns with the Coastal Act policy of focusing development in or near existing developed areas (Coastal Act Section 30250).</li> <li>• “Conserve open space and agricultural lands” aligns with Coastal Act policies related to conservation of sensitive habitat, open space, and coastal agricultural lands (Coastal Act Sections 30230, 30231, 30233, 30241).</li> <li>• “100% of new buses are zero-emission,” “400,000+ electric cars on the road,” “Sustainable freight (transitioning to zero emissions where feasible),” and “Up to 100% renewable electricity” aligns with the Coastal Act requirement that new development minimize energy consumption and VMT and be consistent with requirements imposed by an air pollution control district or the State Air Resources Board on each particular development (Coastal Act Section 30253).</li> <li>• “Walkable and bikeable communities” aligns with Coastal Act policies promoting the protection, addition, and enhancement of public access (Coastal Act Sections 30210, 30212.5, 30252).</li> </ul> <p>Appendix B additionally identifies strategies for the implementation of affordable housing, such as minimum zoning near transit, fee-waiver programs, and accessory dwelling units, which align with Coastal Act Sections 30213 (Lower Cost Overnight Accommodations) and 30013 (Environmental Justice). However, there are aspects of the Regional Plan that could be strengthened to be more consistent with the Coastal Act as described below.</p>	<p>Thank you for this comment and acknowledgement of areas of consistency between the 2021 Regional Plan and California Coastal Act.</p>
L12	<p>Consistent with Senate Bill (SB) 375, the California Air Resources Board (ARB) sets targets for reduction of GHG emissions from passenger vehicles for the target years 2020 and 2035, which Chapter 2, “Sustainable Communities Strategy,” notes the Regional Plan will accomplish. However, as noted in the Regional Plan, Executive Order B-30-15, and California Senate Bill 32 (Pavley, 2016), set a further statewide goal of reducing California’s GHG emissions to 40 percent below 1990 levels by 2030 and the Executive Order B-55-18 set a statewide goal of carbon neutrality by 2045. Recognizing the needs of all residents and visitors to the San Diego region, the Regional Plan rightfully includes improvements to all transportation modes, including roads and parking, but in order to meet or exceed the referenced GHG and climate goals, projects that improve public transit and active transportation to minimize VMT should be completed as quickly as possible, consistent with the Coastal Act (Section 30253). Additionally, active transportation projects that provide emission free transportation options and can be implemented relatively quickly should be prioritized, including completing segments of the California Coastal Trail and Coastal Rail Trail in the near-term (2025) rather than in future phases (2035 or 2050). Specifically, trail segments providing access to major employment centers that would relieve strain on coastal access corridors and that would help relieve congestion on Interstate 5, such as the segments connecting Carmel Valley to Roselle Canyon; Del Mar to Sorrento; and Roselle Canyon/UTC to Rose Canyon, should be prioritized for near-term construction. In general, Coastal Commission staff support greater proportions of investment in transit, active transportation, and environmental enhancement projects as compared to roadway improvements targeting single-occupant vehicles.</p>	<p>The phasing of projects in the 2021 Regional Plan considers many factors including project readiness, connectivity, social equity, and anticipated revenues by implementation period. Projects proposed by 2025 have secured funding and are programmed in the Regional Transportation Improvement Program (RTIP). As the 2021 Regional Plan is implemented and updated, phasing of projects may change as opportunities arise to advance projects into earlier phases of the plan.</p>
L13	<p>Finally, the Coastal Act (Section 30250) encourages new residential, commercial, or industrial development, to be located within, contiguous with, or in close proximity to, existing developed areas. Accordingly, the Regional Plan should prioritize transportation investments which encourage jobs and housing to be concentrated in developed areas and avoid further encroachment into habitat, farmland, and open space recreational areas by moving them forward to earlier construction phases.</p>	<p>Consistent with this comment, the 2021 Regional Plan proposes a land use pattern that complements the transportation investments of the plan and concentrates future growth and development in Mobility Hub areas.</p>
L14	<p>Given that beaches and coastal resources are major destinations in the San Diego region, the Regional Plan should maximize access to the coast, including expanded investments in bicycle and pedestrian routes. The proposal to dedicate 55% of the anticipated \$163 billion in funding over the next 30 years to capital improvements to the transit system will improve public access to and along the coast, and is supported by Commission staff, but projects that</p>	<p>As SANDAG developed the proposed network for the 2021 Regional Plan, data on trip-making was used to understand the critical connections of the region. Connections to coastal areas are represented in these critical connections. Implementation of the regional bike network as well as complete streets in Mobility Hubs will support enhancements for active transportation in coastal communities.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	specifically facilitate access to beaches and coastal areas from the inland portions of the region should be expedited, as well as options for enhancing connections to public transit, the California Coastal Trail (CCT), the Coastal Rail Trail, and other visitor-serving recreational opportunities. Implementation of the Regional Plan would make significant improvements to the regional bike network, most notably in terms of Class I corridors and in coastal communities that will enjoy enhanced coastal access as a result of these improvements. Coastal Commission staff support these improvements as well as further network and infrastructure enhancements for active transportation, such as widened sidewalks in areas without designated bike lanes, increased funding for bicycle parking and locker facilities, and bicycle-specific signaling integration on local arterials and feeder streets.	
L15	Coastal Commission staff acknowledge and appreciate the inclusion of updated information regarding the completeness and deficiencies in the San Diego region's portion of the California Coastal Trail in the 2021 Technical Addendum to Appendix W: California Coastal Trail. The addendum should also reference the recent work of the California Coastal Commission, California Department of Transportation, and Coastal Conservancy in developing an ArcGIS-based mapping tool that identifies all complete and incomplete segments of the Coastal Trail and classifies them according to trail type, identifies land ownership, and identifies features, such as individual stairways and pathways. The most recent update to the CCT mapping effort is outlined in the California Coastal Commission Memorandum Re: California Coastal Trail Mapping Project, April 2021. In light of these improvements to the available data and SANDAG's identification of large portions of the CCT that are still in need of completion, a stronger emphasis on pedestrian and bicycle improvements necessary to complete the trail should be provided in Chapter 3 and a stronger and more specific funding commitment for the CCT should be provided in Appendix A: "Transportation Projects, Programs, and Phasing." Specifically, a portion of the funding identified for "Local Streets and Roads" (9% of the Regional Plan expenditures) should be allocated to funding the completion of the CCT.	In response to this comment, a reference to the California Coastal Trail mapping effort was added to the 2021 Technical Addendum in Appendix W. SANDAG efforts in bike and pedestrian infrastructure implementation have most recently and intensely been focused on utility transportation for all-weather travel by bicycles, pedestrians, or other ped-assisted devices with strict adherence to local codes and ADA standards. Regarding the recommendation to allocate a percentage of the Local Streets and Roads funding for completion of the trail, this would require a Board action and approval for application to just a subset of jurisdictions with intersecting segments of the trail, while not applying to others.  SANDAG designs, funds and builds All Ages and Abilities bikeway utility routes (like the New Segments identified in Appendix W) to develop a comprehensive regional bike network as approved by the SANDAG Board of Directors in 2010's Riding to 2050: The San Diego Regional Bike Plan, and prioritized with funding in 2013 by the Board of Directors via the SANDAG Bikeways Early Action Program (EAP). More information can be found at the following links:  <a href="https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail</a> <a href="https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail</a>
L16	Further, Commission staff encourage the integration of data related to weekend peak traffic in the planning phase of projects with potential impacts to congestion on major coastal access corridors used to access weekend recreation, such as Interstate 8, Interstate 5, and Pacific Coast Highway. Commission staff encourage SANDAG to implement enhanced transit alternatives where weekend coastal access will be significantly affected.	SANDAG will consider data related to weekend peak traffic as it implements priority implementation action 10: Advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery.
L17	Coastal Commission staff suggest that the Regional Plan include specific reference to Coastal Act Chapter 3 policies requiring the preservation of coastal resources, as well as specific language concerning the importance of protecting and restoring the region's urban canyons, coastlines, beaches, and water resources. Transportation corridors within the San Diego region bisect or are located directly adjacent to sensitive marine resources including coastal bluffs, streams, lagoons, and the Pacific Ocean. Many of these coastal systems have already been impacted by historical transportation infrastructure development and additional impacts to these resources are restricted by Coastal Act policies. Except for certain specific instances, fill of a wetland or other coastal waters is prohibited (Section 30233), and the marine resources (Section 30230), water quality (Section 30231), and environmentally sensitive habitat areas (Section 30240) often associated with the coastal environment are also protected.	SANDAG provides an analysis of projects' impacts to coastal resources identified under the California Coastal Action in the Draft EIR analysis (Section 4.4 Biological Resources). SANDAG encourages the Coastal Commission to comment on that report.
L18	The Regional Plan should include increased funding to adapt and/or relocate existing transportation infrastructure known to be vulnerable to climate change and sea level rise (e.g., Pacific Coast Highway and the rail corridor along Del Mar bluffs). New infrastructure proposed to be funded should be analyzed not only for vulnerability to H++ projections of SLR over the expected life of the proposed project, but also tidal and fluvial hydraulics as applied to the local area and in the context of storm surge, wave run-up, erosion, and other variables. Projects which reduce vulnerability to climate change and sea level rise (e.g., active transportation projects and relocation of the rail corridor from coastal bluffs) should be prioritized and expedited.	Resilience of transportation infrastructure to climate impacts is a priority of the 2021 Regional Plan. As such, the relocation of the rails off of the Del Mar bluffs is a priority project with planning already underway. Appendix R includes additional information on current climate adaptation and resilience efforts underway and new programs that will reduce vulnerability to climate change and sea level rise. In response to this comment, language has been added related to increasing funding, prioritizing, and expediting projects to adapt and/or relocate existing climate vulnerable transportation infrastructure.
L19	The Coastal Act was also recently amended to add Environmental Justice as a policy to be analyzed in our regulatory work, and to add a designated Environmental Justice commissioner on the Coastal Commission. Accordingly, although we applaud the Regional Plan's focus on equity and recognize the need to generate revenue for implementation, Commission staff urge SANDAG to carefully analyze the equity implications of the Regional Pricing Strategy, including ensuring that dynamic tolling on managed lanes, parking and curb pricing, and road user charges do not regressively impact low-income community members who may not be able to afford to live in transit-oriented neighborhoods.	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help SANDAG to design a road usage charge program that is more fair than current transportation funding sources. SANDAG also will collaborate with state and federal agencies that are partnering to evaluate road charge programs in California.
L20	Further, the Regional Plan should utilize access to coastal recreation as a metric with which to measure the efficacy of its Environmental Justice programs. This should be accomplished by comparing travel times to coastal resources (e.g., the nearest usable beach) in communities of concern to travel times in other nearby communities. Transit programs	The performance measures and social equity analysis for the 2021 Regional Plan considered several access metrics, including access to parks, retail, medical facilities, employment centers, and higher education.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	should be designed to reduce these travel times and close gaps between communities to achieve equitable coastal access across the San Diego region, consistent with Coastal Act Section 30252.	SANDAG can consider access to coastal resources in the Comprehensive Multimodal Corridor Plans and future updates of the Regional Plan.
L21	<p>Previous Regional Transportation Plans and the North Coast Corridor Public Works Plan / Transportation and Resource Enhancement Program (NCC PWP/TREP) have referenced the need for relocation of the rail corridor that passes along the Del Mar bluffs to an inland alignment. Erosion due to wave action currently threatens the toe of the Del Mar bluffs and the stability of the railroad tracks at the top of the bluffs. Given that this segment of the LOSSAN rail corridor is already experiencing periodic bluff failures, which will only be exacerbated as sea level rise continues, Coastal Commission staff support relocation of the rail corridor and completion of double tracking as quickly as possible. The Coastal Commission has authorized a series of improvements to existing shoreline protection devices in Del Mar to maintain continued rail operations, including the most recent Consistency Certification No. CC-0004-18 in February 2019 and CC-0001-20 in August 2020; however, these projects are intended to serve as interim measures only. Although these types of repair and maintenance projects may be necessary in the short-term, they should not delay the planning efforts associated with a long-term solution, including identifying a preferred tunnel alignment and allocating funding to initiate environmental review of the rail corridor relocation project. If we continue to rely on reactive, hard-armoring measures to protect the rail corridor in place, we will lose our coastal beaches in the face of anticipated sea level rise at Del Mar and elsewhere. Therefore, Coastal Commission staff request that the Del Mar tunnel project be prioritized further by being moved to the five-year capital project list. This would allow double tracking to occur sooner, improving coastal access by sustainable modes of transportation while protecting the Del Mar bluffs, a vital visual and habitat resource for the San Diego region.</p>	The Del Mar tunnel is a top priority for SANDAG. Planning work is underway with preliminary engineering and environmental phase expected to begin as soon as 2022 if funding is secured. SANDAG reviewed the timelines of other similar tunnel projects throughout North America and the 12 to 15 year timeframe is consistent with industry best practices. The 2021 Regional Plan identifies funding to kick start the environmental, design, and right-of-way phases of the Del Mar Tunnel project by 2025 with construction funding in the 2035 phase.
L22	<p>The Coastal Commission has previously approved transportation projects and programs that balance roadway expansion with the provision of transportation alternatives including railway enhancements, bicycle corridors, and pedestrian accessways (e.g., the North Coast Corridor Public Works Plan/Transportation and Resource Enhancement Program). In actions throughout California, the Coastal Commission has found that projects supporting alternative modes of transportation, particularly enhanced rail service, are consistent with Coastal Act policies requiring maximum public access and a reduction in VMT (Coastal Act Sections 30210 and 30253). The Regional Plan proposes funding for high-frequency transit services that incorporate new transit modes and improve existing services. Commission staff supports the vision for vastly improved regional and inter-regional bus and rail corridors, which will offer alternatives to driving and alternatives to roadway expansion in environmentally sensitive areas.</p> <p>The California State Transportation Agency’s Transit and Intercity Rail Capital Program (TIRCP) (2015) emphasizes the objective of “Expand[ing] and improv[ing] transit service to increase ridership.” In 2020, the TIRCP allocated over \$38 million to capital improvements to the LOSSAN corridor, including new maintenance facilities that will allow for longer trains and more frequent and reliable service on the corridor. The Draft 2018 California State Rail Plan website states: “Californians collectively take billions of trips to millions of destinations each year, and the state needs quality modal choices among cars, transit, air travel, and active transportation to efficiently move people and freight to their destinations.” Coastal Commission staff support the expansion of San Diego’s commuter rail network and the double tracking of the LOSSAN corridor funded by the Regional Plan, in addition to other infrastructure improvements that encourage faster and more frequent intercity and intracity rail service such as those identified in the TIRCP.</p>	SANDAG looks forward to working with Coastal Commission and other state agencies to implement the rail network described in the 2021 Regional Plan.
L23	In previous comment letters, Coastal Commission staff have expressed support for the development of an intermodal transit station along the existing rail corridor to provide visitors with direct connections to Amtrak, COASTER, Trolley, bus services, and the southern terminus for the proposed high-speed train service. The acquisition of land for the Central Mobility Hub and the completion of the automated people mover airport connection in 2035 (Pages A-17 and A-18, Appendix A) will significantly improve alternative access to the airport, thereby reducing the anticipated traffic impacts associated with redevelopment of Terminal 1 on North Harbor Drive, a major coastal accessway. Please note that Coastal Commission staff request to be included in future planning efforts related to the Central Mobility Hub, as well as the associated transportation infrastructure projects (e.g., automated people mover).	SANDAG looks forward to Coastal Commission staff participation in future planning efforts related to the Central Mobility Hub and related connections.
L24	Finally, the 2019 Draft Federal Regional Transportation Plan identified a trolley extension from Pacific Beach to the El Cajon Transit Center and a streetcar from Mission Beach to La Jolla via Pacific Beach slated for completion by 2050 (Table A.2, Appendix A). Neither of these projects is identified in the 2021 Draft Regional Plan. The popular beach community of Pacific Beach is already heavily impacted by parking and traffic congestion, which will be exacerbated in the future by redevelopment with increased density and the elimination of parking requirements by the City of San Diego for certain developments located near transit. Coastal Commission staff request the re-inclusion of these projects in the Regional Plan, as the transportation improvements identified for Pacific Beach in the 2021 Regional Plan leave large portions of the community without robust alternatives to single-occupant vehicle travel and increasingly strained access to parking, inconsistent with Sections 30212 and 30212.5 of the Coastal Act.	The 2021 Regional Plan proposes two Rapid bus lines to serve Pacific Beach, offering connections from Pacific Beach to Kearny Mesa (Rapid 292) and from the new Balboa Trolley Station to Sorrento Mesa via Pacific Beach, La Jolla, and UTC (Rapid 30). These projects are proposed by 2025 and 2035 respectively, offering transit solutions to Pacific Beach on a quicker timeline. In addition, Pacific Beach is an identified Mobility Hub area where the 2021 Regional Plan proposes investments in Flexible Fleet services and complete street improvements.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L25	In general, Coastal Commission staff support improvements to transit alternatives that provide access to coastal areas and recreation. Significant gaps in the regional bus network improvements laid out in the Regional Plan exist in the coastal communities of Encinitas, Solana Beach, La Jolla, Pacific Beach, Mission Beach, and Ocean Beach, whereas other coastal communities are slated to enjoy more robust transit improvements. As such, Coastal Commission staff encourage SANDAG to analyze and prioritize transit improvements that improve coastal access in these communities, and particularly improvements that provide these communities with meaningful alternatives to single-occupant vehicles to access the nearby beaches and recreational areas.	The 2021 Regional Plan proposes improvements to the local bus system and Rapid bus routes that service many of the coastal communities identified in this comment. In addition, Flexible Fleet services will provide on demand services to supplement the transit system and provide meaningful alternatives to single-occupant vehicles.
<b>California Department of Transportation, Office of State Planning, Equity and Engagement (OSPEE)</b>		
L26	With development concentrated at the coastal region, has the scientists' estimates of a 2.5 sea level rise been taken into account for development in this area? (pdf page 9)	As described in Chapter 2, 5% of future housing growth is expected in coastal mobility hub areas. Best available science and data on sea level rise impacts and adaptation strategies will continue to be considered in development in coastal areas. Vulnerabilities are localized and there are development opportunities in coastal communities that are not at risk of sea level rise impacts.
L27	There was a brief mention of the California Transportation Plan 2050 (CTP 2050) in the bulleted list on Page 14. As the State of California's transportation roadmap, it might be pertinent to demonstrate with a few sentences as to how the 2021 Regional Plan meets or aligns with the CTP 2050's Recommendations on Page 6 of the Executive Summary of the CTP 2050 document. Here is language that could be potentially used: o Senate Bill 391 (SB 391, 2009) required the California Department of Transportation to prepare the California Transportation Plan (CTP), a statewide to reduce GHG emissions. This system laid out in the CTP 2050 showed reductions in GHG emissions to 1990 levels from current levels by 2020, and 80 percent below the 1990 levels by 2050 as described by AB 32 and Executive Order S-03-05. The CTP 2050 demonstrates how major metropolitan areas, rural areas, and state agencies can coordinate planning efforts to achieve critical statewide goals. SANDAG will work to align with the goals, policies, strategies, and recommendations laid out in the CTP 2050 where applicable.	The 2021 Regional Plan aligns well with the recommendations from CTP 2050. SANDAG looks forward to coordinating with Caltrans on these recommendations.
L28	Pages 14 and 15 feel a bit out of place and seems like it would be better places after the Table of Contents that is present in the "Forward" section, rather than being right before Chapter 2. The chapter list of Page 15 is essentially the same as the Table of Contents so keeping the nice graphics with the same overview/summary would be good, while having the actual TOC have subsections within the chapters listed, with their corresponding pages as well (5 Big Moves, etc).	SANDAG will consider this suggested edit to Chapter 1 and the table of contents.
L29	It may be beneficial to mention how these goals will contribute to California's overall State goal of reducing GHGs, with a mention of AB 32's goal of lowering statewide GHG emissions 80% below 1990 levels by 2050 as well as SB 32's mid-point goal of lowering statewide GHG emissions 40% below 1990 levels by 2030. Disregard if this was mentioned but overlooked by the reviewer.	Chapter 2, under Climate Strategies, mentions how implementation of the 2021 Regional Plan supports local jurisdictions and state agencies in achieving their climate goals.
L30	On Page 44: "The 2015 update of the regional plan was projected to cost \$130 billion in 2020 dollars. The 2021 Regional Plan is projected to cost \$163 billion. Why the higher cost? As we have detailed in Chapters 1 and 2, the 2021, the Regional Plan completely reimagines our transportation system—". While the 2015 may also be assumed to have taken bold steps to reimagine the transportation system, it might be ideal to refer to the appropriate technical Appendix as to why a newer, updated approach is costing \$33 billion more six years later.	Chapter 3 includes references to technical appendices with details on the proposed projects, estimated costs, and revenues; these include: Appendix A: Transportation Projects, Programs, and Phasing; Appendix U: Cost Estimation Methodology; and Appendix V: Funding and Revenues.
L31	Overall a very good and thorough plan, would just mention of alignment with the CTP 2050.	Thank you for your support of the 2021 Regional Plan and suggestion to mention alignment with the CTP 2050.
<b>Caltrans District 11</b>		
L32	Transportation is the largest source of greenhouse gas (GHG) emissions in the San Diego region; in 2016, on-road light-duty vehicles accounted for 41% of emissions. One strategy to reduce emissions is to reduce Vehicle Miles Traveled (VMT). The Regional Housing Needs Allocation Plan informed development of the SCS land use pattern, and the region's major employment centers and urban core mobility hubs are expected to take on the most housing and job growth in the region over the next 30 years. It is anticipated this development pattern will support VMT reduction from light-duty vehicles by balancing the ratio of jobs to housing land uses. Additionally, the 2021 Regional Plan proposes expansion of the regional transit network such that thirty-minute transit access from mobility hubs to Tier 1 employment centers increases from 13% to 28% for communities of color and increases from 16% to 33% for residents with low incomes by 2050. This improvement will provide important access to economic opportunities to these communities while incentivizing mode shift.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
L33	Caltrans supports SANDAG's embrace of new and improved mobility management strategies such as developing a smart intersection system, a comprehensive system to manage cross-border trips, and real-time traffic management solutions (including dynamic truck parking) to manage many modes of transportation, including freight movement.	Thank you for your support of the proposed investments in mobility management strategies.

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
L34	We encourage SANDAG to continue efforts on a recently funded grant to develop a Sustainable Freight Implementation Strategy. This work will help the region execute a road map for a more efficient, economically competitive, and sustainable freight transportation system, establish a framework to transition to a clean freight system, reduce pollution exposure to environmental justice communities, and help implement state sustainable freight efforts such as the California Sustainable Freight Action Plan, the California Freight Mobility Plan, Governor Gavin Newsom’s “Zero-Emission by 2035” Executive Order (N-79-20), and Assembly Bill 617 (C. Garcia, 2017) Community Emission Reduction Program.	SANDAG looks forward to coordinating with Caltrans and other partners on the Sustainable Freight Implementation Strategy.
L35	Caltrans supports consideration and the development of new mechanisms for viable VMT mitigation options for highway capacity projects, such as exploring statewide and regional VMT mitigation bank concepts and evaluating feasibility and exploring potential expansion of an Advanced Mitigation Program to include GHG/VMT mitigation.	SANDAG participates in the statewide SB 743 working group on these topics and looks forward to continuing to coordinate with Caltrans and other agencies on VMT mitigation options.
L36	As the 2021 Regional Plan looks to develop performance measures, analyze, and address congestion, please consider presenting data about how travel, delay, and transit use will evolve with the implementation of the plan.	SANDAG will consider these data as it implements Action 10 of the 2021 Regional Plan: Advance a data science program to better understand travel behavior and issues in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery. Appendix T of the proposed final 2021 Regional Plan will include forecasted travel time data for key corridors.
L37	Caltrans is encouraged by the investments outlined in SANDAG’s Supporting Policies and Programs. These investments will support programs that complement the capital and operational investments of the transportation system, encourage sustainable growth and development, and implement innovative demand strategies. Please consider inclusion of a program for Highways to Boulevards Conversion or freeway cap/lid/decks to create new park space, housing, or community amenities to help restore and revitalize communities. Proposed locations will be discussed and determined in the future.	In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 will continue to develop Comprehensive Multimodal Corridor Plans (CMCPs) in coordination with agency partners and local city governments. Opportunities for Highways to Boulevards Conversions or freeway caps will be considered in the CMCPs.
L38	Please consider including in the listing of transportation projects, programs, and phasing the San Diego- Coronado Bridge Suicide Prevention Barrier Project. The Coronado Bridge has the highest concentration of death by suicide for a spot location on the state highway system. Without mention in the regional plan, the project may not be able to compete for state or federal funding.	A discussion of the San Diego-Coronado Bridge Suicide Prevention Barrier Project will be added to Appendix Q Transportation Security and Safety in the proposed final Regional Plan.
L39	<p>Caltrans recognizes the rural areas of our region play a vital role in California’s economy. Rural communities are often also the gateway to the state’s preserved landscapes that are central to supporting California’s tourism industry. Yet, rural communities are already experiencing the impacts of a changing climate— from unprecedented storms to devastating wildfires. While transportation goals are inherently and fundamentally the same no matter the context— to provide safe access to destinations for people and goods - unique local and regional conditions require tailored solutions to advance these goals, and solutions may look different in varying local contexts.</p> <p>Please consider including additional examples of sustainable transportation solutions that could be applied in rural settings, understanding that these efforts will require collaboration with the local and Tribal governments that serve the locations, such as:</p> <ol style="list-style-type: none"> <li>1. Increasing transit service in a corridor through investments in bus service, vanpools, micro-transit or mobility on demand services, and park-and-ride facilities.</li> <li>2. Roadside land management activities related to wildfire.</li> <li>3. Addressing safety through the multidisciplinary Safe System Approach that employ tools for speed management, such as road diets, conversion of intersections to roundabouts, and signal coordination to slow speeds.</li> <li>4. Improving efforts on coordination for broadband access in transportation and growth, remote work/VMT reduction, economic development, and regional housing strategies. Broadband access remains a critical issue in rural communities and with many Tribal nations.</li> <li>5. Adding and improving connected facilities for walking and bicycling and for first/last-mile connections to local, interregional, and regional transit routes. Rural cores should support walking and biking on commercial corridors and main streets.</li> <li>6. Prioritizing connections to natural areas; Tribal communities may desire access to ceremonial sites outside of the rural core.</li> <li>7. Facilitating emergency evacuations through efficient traffic management strategies, such as the use of contra flow,</li> </ol>	Please see where these examples are included in the 2021 Regional Plan: These examples are included in Transit Leap and Flexible Fleet services. This example is included in the description of the Climate Adaptation and Resilience implementation actions in Appendix B. These examples are included in the description of Active Transportation and Demand Management and complete streets in mobility hubs. These examples related to broadband access have been added to the description of rural corridor improvements in Appendix A. The 2021 Regional Plan includes the adopted Regional Bike Network, which identifies the I-8 Bikeway along that rural corridor. Examples provided in this comment can be considered in County of San Diego-led active transportation projects and in a future Regional Active Transportation Plan. The Intraregional Tribal Transportation Strategy was used to inform many of the improvements identified for the rural corridors. These examples have been added to the description of rural corridor improvements in Appendix A. These examples are included in the Electric Vehicle programs proposed in the 2021 Regional Plan.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>use of two-way left turn lanes as through travel lanes, construction of full structural sections of shoulders and installation of transportation management systems (TMS) elements, such as closed circuit television (CCTV) cameras, changeable message signs (CMS), and traffic detection equipment.</p> <p>8. Deploying zero-emission vehicle charging or fueling infrastructure—including for battery electric, fuel cell (hydrogen) electric, and other zero-emission vehicle technologies.</p>	
<b>Center for Sustainable Energy</b>		
L40	<p>CSE supports SANDAG’s proposed Mobility Hubs concept to provide integrated transportation solutions. CSE recommends that SANDAG utilize these Mobility Hubs to showcase a variety of clean energy and transportation technologies. Specifically, Mobility Hubs could raise awareness of zero- emission transportation alternatives, including EVs and zero-emission buses. Additionally, the mere presence of visible public charging infrastructure can influence consumers’ willingness to pay for an EV by up to \$5,000. CSE also recommends that additional clean energy technologies be integrated into the Mobility Hubs. For example, EV chargers could be coupled with solar panels and battery storage systems to provide greater utilization of clean electricity. To expand this concept even further, CSE encourages SANDAG to consider deploying microgrids in conjunction with Mobility Hubs. Microgrids can further integrate these technologies to provide additional emissions reductions, while also managing grid impacts and providing resiliency benefits during extreme weather events. Through islanding capabilities, microgrids would enable Mobility Hubs to continue to charge electric fleets during electric grid outages, further alleviating consumers’ concerns about all-electric transportation options.</p>	<p>Thank you for your comment and support of the 2021 Regional Plan. SANDAG plans to explore integrated renewable energy options for EV chargers at Mobility Hubs and will explore microgrid options to address climate and energy resiliency for EV charging and other Mobility Hub amenities that rely on electricity.</p>
L41	<p>CSE is pleased to participate in SANDAG’s Energy Working Group (EWG) and strongly supports the EWG’s role in coordinating regional climate action planning, particularly through the use of analytical tools such as the Regional Climate Action Planning Framework (ReCAP). CSE encourages SANDAG to continue this work by periodically sharing best practices on climate action planning. For example, CSE suggests that the release of the ReCAP Snapshots be accompanied by targeted policy recommendations for local jurisdictions. Additionally, the EWG is an effective venue for sharing best practices on local climate equity planning initiatives, such as the Climate Equity Index reports prepared by the Cities of San Diego and Chula Vista, and applying these “lessons learned” on a broader regional scale. CSE also recommends SANDAG engage its Regional Plan Social Equity Working Group (WG) to gather feedback and recommendations on how to operationalize equity throughout the agency, using the Regional Plan as a starting point. Lastly, CSE recommends that the EWG and the Social Equity WG seek to collaborate with emergency planning and land use officials from state, regional, and local agencies, who are often not involved in conventional climate action planning activities. This type of information-sharing and collaborative planning across agencies and departments will be critical to mitigate the impacts of extreme weather events including heatwaves, wildfires, and droughts, which are expected to continue to increase in frequency and severity.</p>	<p>Through the Holistic Implementation of Adaptation and Transportation Resilience project, SANDAG is currently preparing an implementation tool, economic guidance document, and equity prioritization document to help local planners address climate risks and adaptation needs by holistically implementing projects that link mitigation, adaptation, and broader community benefits. Staff has received input from the Social Equity Working Group and will be incorporating it into the final deliverables. Furthermore, the 2021 Regional Plan includes a Regional Resilience Framework, which could leverage creative partnerships to support regional resilience, such as creating “resilience hubs” for emergency/disaster response; partnering with emergency planning professionals on this effort would be imperative.</p>
L42	<p>CSE supports the development of SANDAG’s proposed Next OS platform to incorporate transportation data and streamline individuals’ travel patterns. CSE offers a number of recommendations to integrate EVs into this platform and facilitate better understanding of travel behavior and associated emissions impacts.</p> <p>First, CSE recommends that SANDAG include data on EV infrastructure locations and availability in the Next OS platform. Lack of access to EV charging is often cited as one of the largest barriers preventing consumers from purchasing EVs. Even EV owners often experience difficulty finding a public EV charger given the number of EV service providers (EVSPs) with proprietary software applications. Additionally, CSE encourages SANDAG to consider integrating information regarding EV charger availability to prevent queues from developing at these sites. While some EVSPs have added waitlist functionalities into their software, there is no uniform approach to addressing this challenge. By integrating these factors into the Next OS platform, SANDAG can support current and prospective EV owners and further promote electrified transportation.</p>	<p>SANDAG will explore ways to integrate EV charger location and availability data into the Next OS platform.</p>
L43	<p>Second, CSE recommends incorporating greenhouse gas (GHG) emissions data into the Next OS platform in order to provide individuals with information regarding the estimated emissions intensity of various transportation modes. For example, an individual could use the Next OS platform to choose between taking transit or requesting ride-hailing services, considering the emissions associated with each mode and making their decision based off of this information. Similarly, the platform could compare the emissions intensity of various options within a specified mode of travel. For example, an individual choosing to use ride-hailing services could assess the emissions impacts of single-occupancy vehicle trips versus pooled trips or the difference between rides in an EV versus in an internal combustion engine vehicle. This functionality could increase public awareness of emissions impacts and encourage greater utilization of clean transportation options.</p>	<p>SANDAG will explore ways to integrate GHG emissions and/or sustainability data into the consumer-facing elements of the Next OS platform.</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
L44	<p>Third, CSE recommends that the key analytical insights obtained through the Next OS platform be compiled and highlighted on public dashboards, either on the platform itself or on SANDAG’s website. By its nature, the Next OS platform will collect significant levels of data on individual travel patterns and preferences. Analyzing this data will yield key insights that can further inform regional planning and policymaking. Additionally, highlighting these insights through dashboards and visualizations, and thereby making this data accessible and understandable to the general public, will also enable individuals to better understand their transportation options and impacts. These dashboards should be made available in multiple languages and should be updated at regular intervals.</p>	<p>SANDAG envisions the development of a data analytics module within Next OS that will allow for the analysis of travel data from various modal sources. Next OS will also provide the ability to share the data to transportation operators, planning staff, and decision makers via planned Next OS dashboards. SANDAG will also explore ways to provide data via a public facing dashboard.</p>
<b>Chicano Park Museum</b>		
L45	<p>My name is Josephine S. Talamantez and my family have been Logan Heights residents since 1906 and the CPMCC have been in the area for 6 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)</p> <p>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the 1-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</p> <p>As mentioned, the construction of the 1-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that 1-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal - a freeway lid is the answer.</p> <p>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:</p> <p>The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</p> <p>Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A- 12)</p> <p>Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.</p>	<p>Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</p>
<b>Chollas Creek Coalition</b>		
L46	<p>Chollas Creek Coalition requests SANDAG include Chollas Creek Regional Park active transportation and recreational facilities in the 2021 update of the San Diego Forward Regional Transportation Plan (RTP).</p> <p>Environmental Justice communities located along the Chollas Creek Watershed have been historically under-invested in and residents are predominantly lower-income people of color with higher-rates of health issues resulting from over-</p>	<p>The Chollas Creek Bikeway will be incorporated into the 2021 Regional Plan.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>pollution and inequitable access to economic opportunity. These communities bisected by freeways do not have safe mobility connections for people to get around without a car.</p> <p>The future Chollas Creek Regional Park included in the 2021 draft of the City of San Diego's Parks Master Plan has approximately 8 miles of parks, trails, recreational amenities, trees, bikeways and stormwater infrastructure improvements along the north and south forks of the Chollas Creek in need of planning and funding. This trail system once completed would connect City Heights, Southeast San Diego and the communities in between all the way to Barrio Logan and the employment centers along the San Diego Bay.</p> <p>SANDAG has a once in generation opportunity to make a meaningful investment in the many communities along the Chollas Creek by including the Chollas Creek Regional Park and associated bikeway projects in the RTP. These critical active transportation connections to improve community health, resiliency to climate change and link housing to jobs are many decades over-due. We urge SANDAG to invest in the project to advance equity, climate justice and a historic win for communities who have been ignored for far too long.</p>	
<b>City Heights Built Environment Team</b>		
L47	Greater transit frequencies (7 min on peak, and 10 mins all day) in Transit Priority Areas; Collaborate with the Built Environment Team on a Pilot Program to identify and test high ridership routes in City Heights	SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.
L48	Late night and weekend service improvements with 24-hour service on major routes.	The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.
L49	Supporting the Purple Line alignment through central City Heights.	The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.
L50	Bikeways on major corridors with implementation of Early Action Projects in Mid-City by 2023.	The bicycle network outlined in the 2021 Regional Plan were laid out and prioritized based on the analysis performed in Riding to 2050: San Diego Regional Bike Plan. While the horizon year for build out is 2050, this just means it would be proposed to be completed by that time. Many projects will likely be completed sooner, and some are already in construction. This is especially true as new funding sources come available. Additionally, as an early action out of the 2021 Regional Plan, SANDAG will be developing a new Regional Active Transportation Plan in which projects will be reassessed and reprioritized based on data and community engagement. The regional network compliments the much more extensive networks which local jurisdictions plan and construct on their own streets. There are also opportunities for the development of protected bike networks via "Complete Streets in Mobility Hubs" funding included in the Regional Plan.
L51	Implementing traffic-calming measures including but not limited to: protected bike lanes, roundabouts, raised crossings to improve to ensure a safer biking experience.	Traffic-calming measures such as those described in this comment are included in the proposed 2021 Regional Plan through investments in the Regional Bike Network, Complete Streets in Mobility Hubs, and Vision Zero programs.
L52	Planting more trees throughout City Heights to foster a healthier urban environment.	The 2021 Regional Plan includes a nature-based climate solutions program that could be used to fund activities such as tree-planting.
L53	Ensuring Youth Opportunity Passes for those aged 24 and under by 2023.	One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
L54	Oppose freeway expansions in City Heights that increase Vehicle Miles Traveled while supporting general purpose lane conversions that prioritize transit.	Improvements to the freeway system are limited to Managed Lanes using existing infrastructure such as general purpose lane conversion and shoulders to facilitate additional transit and high occupancy vehicle travel.
L55	Improve multimodal beach access for urban-core communities.	The Regional Plan includes active transportation, transit, and flexible fleet services that connect communities to various beaches in the region.
L56	Plan and implement Bus Rapid Transit Route 550 on 54th St. to be phased for 2025.	Rapid Route 625 is planned for on 54th St. This project remains phased for 2028 in the proposed final 2021 Regional Plan, however SANDAG has begun advanced planning for this route.
L57	Improve and exceed State of California standards for GHG reduction goals.	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.
L58	Maintain transparency with community members by sharing relevant data and progress updates surrounding project phasing, implementation, and funding.	SANDAG will continue to be transparent and share data and progress updates as the Plan is implemented.

**City of Carlsbad**

L59	<p>City staff have attended the series of workshops that SANDAG hosted during the public review period, and respectfully; starts this section with several questions related to; the process of the; Plan and the Draft EIR. By way of introduction, a jurisdiction's General Plan, such as the city's General Plan, identifies the expected population of the city and any lands outside of the city limits but within their Sphere of Influence where future growth is anticipated to occur. The city's General Plan identifies the subject area adjacent to the McClellan-Palomar Airport for development under the designation for limited and light industrial use.</p> <p>For future land use planning, land use assumptions must reasonably proxy and be generally consistent with local planning standards and; programs; to; be considered; growth accommodating; rather than growth inducing. SANDAG has the; authority under Government; Code Section 65584 to; determine existing and projected housing needs, as well as the share of housing needs to be allocated to cities and counties, but it; is unclear; if SANDAG has jurisdiction to; allocate new housing growth to; areas in a manner not consistent with Government Code Section 65584. Attachment 1 includes additional information on the applicable Government Code and standards. Therefore, and as indicated above, the build-out of properties within the Business Park and flight activity zone must be done in accordance; with the city's General Plan Land Use Diagram, as amended, in accordance with city approval.</p>	<p>Government Code section 65080(b)(2)(B) provides that a Sustainable Communities Strategy (SCS) "use most recent planning assumptions considering local general plans and other factors." It also requires that the SCS "set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board." The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan.</p> <p>The SCS land use pattern proposed in the 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth in mobility hub areas, not specific parcels, for future housing development or housing unit type. A number of land uses at the parcel level, aggregated up, comprise these general areas. The exercise of land use authority is reserved to local jurisdictions. For Carlsbad, the SCS land use pattern forecasts 6,575 housing units from 2016 to 2050, which is within the total housing unit capacity of the City's general plan as provided to SANDAG (6,992 housing units) and accommodates the City's RHNA allocation of 3,873 housing units by 2035. The Series 14 Regional Growth Forecast Documentation and Sustainable Communities Strategy Land Use Pattern Subregional Allocation methodology is available at: <a href="https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG::series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021-draft/about">https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG::series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021-draft/about</a>.</p>
L60	<p>1. The SANDAG website states, "The SANDAG Sustainable Communities Strategy and Final EIR from its 2015 Regional Plan will remain valid and in compliance for purposes of state funding eligibility and other state and federal consistency purposes until the SANDAG Board of Directors adopts a new Regional Plan and EIR, provided those actions are completed by the end of December 2021." SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. Additionally, please clarify when the Draft EIR will be available; it is difficult to completely assess the full impacts of this plan when the public review of the documents is piecemealed.</p> <p>a. SANDAG should clarify how public comments on the Plan are going to be addressed in the Draft EIR prior to its release.</p> <p>b. In the Draft EIR, SANDAG needs to clearly articulate the impacts to land use and if the Plan will cause a significant environmental impact due to a conflict with any land use plan, policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern appears to be inconsistent with the city's General Plan and rezone program to accommodate the Regional Housing Needs Assessment, as well as the general plans of other jurisdictions such as the cities of Coronado, Del Mar and the County of San Diego. The Draft EIR should clarify how implementation of this Plan can occur if those changes are not made.</p>	<p>1a. The Draft EIR analyzes the draft Regional Plan. Comments and responses received on the Draft Regional Plan will be provided in the Final Regional Plan and inform the Final EIR.</p> <p>1b. The Draft EIR includes the required land use analysis in Section 4.11.</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L61	<p>2. The city has three mobility hubs, associated with the Employment Centers Published supporting the SANDAG Regional Plan. 1 McClellan-Palomar Airport is the fifth largest employment center in the region, with Carlsbad State Beach and Carlsbad Village as “Tier 3 and Tier 4” employment centers. The city thanks SANDAG for providing data for analysis to determine impacts and provide for accurate comments on the Plan . Attachment 2 shows a summary of the Mobility Hubs and housing units assumed in the Series 14 Growth Forecast for the year 2050. In summary:</p> <p>a. The assumptions in the updated Series 14 Growth Forecast contain inconsistencies with the city’s General Plan. The Carlsbad Palomar Major Employment Mobility Hub does include increases in density beyond what the citywide numbers appear to show when they are looked at in more detail.</p> <p>i. There are three locations in which density is shown to be inconsistent with good planning principles, the city’s General Plan and the Airport Land Use Compatibility Plan. The three most problematic areas (shown in Attachment 3) are:</p> <ol style="list-style-type: none"> <li>1. 736 units on parcels immediately adjacent to the McClellan -Palomar Airport runway. The location of the airport within this mobility hub was shared with SANDAG staff multiple times at workshops. This is inconsistent with the regulations provided by the San Diego County Regional Airport Authority and conflicts with standard planning principles for siting housing away from hazards.</li> <li>2. 2,755 units on existing developed resort properties and open space dedicated lands adjacent to Legoland.</li> <li>3. 65 units in a preserved open space area.</li> </ol> <p>ii. SANDAG should provide additional detail why units were assumed in these areas, what planning principles those decisions were based on, and how SANDAG expects this to be implemented.</p> <p>iii. Concentration of units in the mobility hubs alone appears to conflict with the direction received from the California Department of Housing and Community Development (“HCD”) to implement new Affirmatively Furthering Fair Housing (“AFFH”), which seeks to combat housing discrimination, eliminate racial bias, undo historic patterns of segregation, and lift barriers that restrict access in order to foster inclusive communities and achieve racial equity, fair housing choice and opportunity for all Californians. The allocations of land use provided by SANDAG seem to focus all the higher density housing into one area of the city. (This is one of the largest points of analysis that each jurisdiction in the region needs to respond to in order to receive a certified Housing Element.)</p> <p>2b. Additionally, looking at the detailed data provided by SANDAG, it is now clear why the citywide numbers only show moderate increases in population. Our analysis has shown that there is an assumed reduction of population by 2,310 persons in the areas within the city but outside of the mobility hubs. This is likely due to assumed reductions in persons per household over time, but SANDAG should clarify the source and reasonableness of this assumption. If housing is not provided consistent with these areas, is it still reasonable to assume persons per household will be reduced in 2050?</p> <p>2c. Furthermore, this reduction in population is not limited to the City of Carlsbad . There is an approximately 85,000 reduction in population assumed outside of mobility hubs regionwide . SANDAG needs to address if that is a reasonable assumption and if this will result in other impacts to public and private projects that will rely on this growth forecast, and the associated Activity Based Model (2+) to project future impacts to transportation, GHG, air quality and noise.</p> <p>2d. The forecast has decreased in future population based on current trends, but it is not clear if there is enough housing provided with reductions and increases in some jurisdictions. Will the reduced amount of housing that will be provided result in an increased exacerbation of the affordability crisis?</p> <p>2e. There is a lack of clarity about how the Plan would be implemented at the municipal level. SANDAG should develop an approach for engaging with municipalities to ensure local support for delivering the regional transportation network. Staff from local jurisdiction have the knowledge and ability to share where there are land use assumptions that conflict with planning and zoning laws. Our analysis focused on the City of Carlsbad, but if these types of assumptions are made regionwide, it presents flaws in the overall analysis. These flaws put the assumed reductions in vehicle miles traveled (“VMT”) and ability to implement the Regional Plan into question.</p>	<p>2. – 2e. Government Code section 65080(b)(2)(B) provides that a Sustainable Communities Strategy (SCS) “use most recent planning assumptions considering local general plans and other factors.” It also requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan.</p> <p>The SCS land use pattern proposed in the 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth in mobility hub areas, not specific parcels, for future housing development or housing unit type. A number of land uses at the parcel level, aggregated up, comprise these general areas. The precise zoning at the parcel level is within local jurisdictions land use authority. For Carlsbad, the SCS land use pattern forecasts 6,575 housing units from 2016 to 2050, which is within the total housing unit capacity of the City’s general plan as provided to SANDAG (6,992 housing units) and accommodates the City’s RHNA allocation of 3,873 housing units. The Series 14 Regional Growth Forecast Documentation and Sustainable Communities Strategy Land Use Pattern Subregional Allocation methodology is available at: <a href="https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG::series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021-draft/about">https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG::series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021-draft/about</a>.</p>
L62	<p>3. The area designated is controlled for use and activity density and intensity through its spatial association with the McClellan-Palomar Airport. The McClellan-Palomar Airport is defined by the Federal Aviation Administration (“FAA”) as a commercial service airport that, in addition to private aircraft, has regularly scheduled commercial flights to Los Angeles International Airport (“LAX”). The McClellan-Palomar Airport Land Use Compatibility Plan (“ALUCP”) is prepared according to FAA requirements and adopted by the San Diego County Regional Airport Authority acting as the Airport Land Use Commission for the County of San Diego.</p> <p>a. The ALUCP provides measures to minimize the public’s exposure to excessive noise and safety hazards within areas around the airport and identifies areas likely to be impacted by noise and flight activity created by aircraft operations at</p>	<p>3a. – d. Government Code section 65080(b)(2)(B) provides that a Sustainable Communities Strategy (SCS) “use most recent planning assumptions considering local general plans and other factors.” It also requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>the airport. These impacted areas include the Airport Influence Area (“AIA”), the Clear Zone and the Flight Activity Zone.</p> <p>b. Within the AIA, the ALUCP establishes six safety zones for the purpose of evaluating safety compatibility of new/future land use actions. The safety zone boundaries depict relative risk of aircraft accidents occurring near the airport and are derived from general aviation aircraft accident location data and data regarding the airport’s runway configuration and airport operational procedures. The ALUCP limits development intensities in these zones by imposing floor area and lot coverage maximums, by incorporating risk reduction measures in the design and construction of buildings, and/or by restricting certain uses altogether. For example, all residential and virtually all non-residential uses are considered incompatible land uses in some zones, while considered to be either compatible or conditionally compatible with the airport in other zones. Attachment 4 shows the McClellan-Palomar Airport, noise contours and SANDAG’s proposed housing units.</p> <p>c. If the proposed SANDAG land use assumptions are endorsed, an amendment to the city’s General Plan would be required to change the land use designation to Mixed-Use Commercial or residential land uses within the existing Business Park in order to effectuate the underlying assumptions of SANDAG staff. This is not a realistic assumption. Further, the protected airspace referenced in the AIA and the ALUCP must also be amended based on SANDAG’s regional planning assumptions. (The FAA establishes airspace protection zones in the airspace above and surrounding airports in order to protect aircraft from obstructions such as buildings, towers, etc. in navigable airspace.)</p> <p>d. When a General Plan is adopted or amended, the allowable growth pattern of an area is identified and the expansion or updating of the various land uses as specified in the General Plan can occur throughout the planning horizon. Without such growth considerations, the expansion or intensification of existing land uses could be considered “growth inducing.” Unplanned and uncontrolled growth may have significant adverse impacts on the environment. CEQA requires a discussion of how a “project” could increase population, employment or housing growth in surrounding areas and the impacts resulting from this growth. The CEQA Guidelines indicate that a “project” would normally have a significant effect on the environment if it would induce substantial growth or a substantial concentration of population.</p>	<p>The SCS land use pattern proposed in the 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth in mobility hub areas, not precise parcel locations, for future housing development or housing unit type. A number of land uses at the parcel level, aggregated up, comprise these general areas. The precise zoning at the parcel level is within local jurisdictions land use authority. For Carlsbad, the SCS land use pattern forecasts 6,575 housing units from 2016 to 2050, which is within the total housing unit capacity of the City’s general plan as provided to SANDAG (6,992 housing units) and accommodates the City’s RHNA allocation of 3,873 housing units. The Series 14 Regional Growth Forecast Documentation and Sustainable Communities Strategy Land Use Pattern Subregional Allocation methodology is available at: <a href="https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG::series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021-draft/about">https://sdforwarddata-sandag.hub.arcgis.com/documents/SANDAG::series-14-regional-growth-forecast-and-scs-land-use-pattern-subregional-allocation-oct-2021-draft/about</a>.</p>
L63	<p>4. At this point, it is not clear if SANDAG’s assumptions adequately contemplate the development patterns included in the Sustainable Communities Strategy (“SCS”)/Regional Transportation Plan (“RTP”), and Regional Air Quality Strategy (“RAQS”), local climate action planning business-as usual estimates, sub-regional traffic modeling, or the airspace assumptions of AIA and the ALUCP.</p>	<p>4. As with each update of the Regional Plan, SANDAG prepares an updated Regional Growth Forecast and subregional allocation that may be a deviation from prior forecasts that have been used in local or subregional analyses. SANDAG is typically required to update the Regional Plan every four years in order to account for the changes in funding outlooks and planning assumptions and to align with state and federal methodologies and mandates.</p>
L64	<p>5. The city seeks clarity on the Plan’s underlying assumptions made to justify the proposed extensive high-speed rail network considering the significant changes in travel behavior which have occurred throughout the region as a result of the COVID-19 pandemic and due to the advancements in disruptive technologies such as telecommuting, autonomous vehicles, microtransit, etc.</p> <p>a. Recent North County Transit District (“NCTD”) Coaster ridership data show riders are not returning to riding the Coaster in comparison to other modes of travel as shown in Attachment 5.</p> <p>b. This question is consistent with comments made by SANDAG’s panel expert Bob Poole regarding the impact of the COVID-19 pandemic on transit ridership and mega-transit projects. (See comments by Bob Poole during the March 12, 2021 presentation to SANDAG starting at timestamp 1:30 p.m.: <a href="https://youtu.be/q-e6bNY5J8?t=5410">https://youtu.be/q-e6bNY5J8?t=5410</a>)</p>	<p>5(a)(b) As part of the development of the transit services for the 2021 Regional Plan, SANDAG completed a comprehensive data analysis to understand the primary travel patterns anticipated to occur between today and 2050. This analysis is described in Appendix T. In addition, SANDAG incorporated the latest information on telecommute patterns as a result of the COVID-19 pandemic. Employment data for the region shows that only a portion of jobs are “telecommutable” and many individuals must travel to a work location. Additionally, SANDAG has been tracking traffic volumes and congestion is returning to pre-pandemic levels. This demonstrates the need for alternatives to driving.</p>
L65	<p>6. The city seeks clarity on why an alternatives analysis was not conducted with consideration of other transit alternatives such as automated /shared vehicle technologies and personalized zero emissions transit programs that are capable of utilizing the existing regional freeway infrastructure in response to these recent developments explained in the above comment.</p>	<p>6. SANDAG has been tracking AV deployment and found that AVs do not provide the capacity needed to reduce VMT on roadways. Current AVs are small passenger vehicles that carry up to four people at a time. On some of our larger transit routes, like the Blue Line Trolley, we have up to 60,000 boardings per day. The planned Purple Line passenger rail service identified in the 2021 Regional Plan is projected to have upwards of 80,000 daily boardings. If these trips were made in single occupant AVs, it would result in significant congestion on our local roadways. Alongside the transit system, the 2021 Regional Plan proposes Flexible Fleet services, which include shared vehicle technologies that could be automated in the future. Flexible Fleets would be supported by the complete corridor investments in the existing freeway infrastructure.</p>
L66	<p>7. The city seeks clarity on why the Plan does not incorporate policies to promote roundabouts over signalized intersections and include a budget line item under the Complete Corridors to fund the construction of roundabouts at new locations and to replace signalized intersections when found feasible. This clarification would support the Federal Highway Administration (“FHWA”)’s project for Accelerating Roundabout Implementation in the United States and the County of San Diego Air Pollution Control Board’s support for implementing roundabouts to address GHG and reduce fatalities.</p>	<p>7. Roundabouts, curb extensions, and similar traffic calming measures are included in the Mobility Hub complete streets investments as a means for slowing vehicular traffic in neighborhoods where a higher volume of multimodal travel to/from key destinations, particularly active transportation, is anticipated.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L67	8. The city seeks clarity on the project phasing proposed within the Plan. Specifically, the city is seeking to understand the timing of implementation of unfunded TransNet projects related to the new projects presented within the Regional Plan. To support this, the city is requesting that SANDAG input the information requested in Table 1 (Attachment 6).	8. A comparison between the <i>TransNet</i> Program of Projects and the Draft 2021 Regional Plan was included in the July 7, 2021 ITOC Agenda Item #2 ( <a href="https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf">https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf</a> ). In addition to the report narrative, you will find in Attachment 1 the details regarding the original <i>TransNet</i> projects and how those are addressed in the Regional Plan corridor by corridor.
L68	9. The city seeks specific data on the proposed 200 miles of rail service contemplated in the Plan. To support this, the city is requesting that SANDAG input the information requested in Table 3 (Attachment 7). Specific questions: a. Please provide more information about the scope of the high-speed rail alignments, potential vehicle technologies and their cost estimates. b. Will the Coaster keep the same rail alignment? c. What funding is programmed or planned for the Carlsbad Village railroad trench and the other projects along the current NCTD/Coaster Service right-of-way? d. Will some of the tracks be at grade with fencing and trains traveling at 110 miles per hour speeds?	9(a)(b)(c)(d) Both the Batiquitos Lagoon Double Track and Carlsbad Village Trench projects are included in the 2021 Regional Plan. These projects will complete LOSSAN double tracking within the City of Carlsbad in generally the same alignment. Some segments of the LOSSAN corridor will remain at grade with fencing.
L69	Section 2 In addition to the comments on process and the Draft EIR provided above, city staff remain concerned that there is not enough detail on the feasibility of implementation of this significant shift in transportation strategy. On specific content in the plans, we outline our recommendations and comments below:  1. Paying for the Plan: The draft 2021 Regional Plan sets out an ambitious plan to build and operate a region-wide system of transportation projects, programs and other improvements. This is a substantial role for SANDAG to play in supporting both the construction and operation of these projects, programs and other improvements. SANDAG should set annual revenue targets to directly fund everything and should approve any recommended sustainable revenue tools to help meet these targets. Many of the funding strategies will require legislative changes, or voter-approved taxation. SANDAG should clarify what will occur if the funding is not available, if opposition to projects stops them from construction, and if General Plans in the region are not modified to implement the Plan.	There are over 30 sources of funding included in the projected revenues for the 2021 Regional Plan. While the assumptions used to develop these revenues are determined to be reasonable based on state and federal standards, the level of projected expenditures provides flexibility to account for any changes in the timing or availability of these funds over the next 30 years. SANDAG is typically required to update the Regional Plan every four years to account for the changes in funding outlooks, priorities, and planning assumptions.
L70	2. Appendix D: Sustainable Community Strategy Documentation: Appendix D includes the Sustainable Communities Strategy, which outlines assumptions included in the Activity Based Model 2+ (“ABM 2+”), updated for this. This model will be necessary for use by publicly and privately initiated land use projects preparing documents for consistency with VMT/CEQA Guidelines and Traffic Impact Analysis (“TIA”) Evaluations. City staff respectfully request direction from SANDAG on how to conduct modeling with the service bureau and how to factor in these assumptions applied to ABM 2+. Specifically, the addition of pricing, parking costs for coastal communities, 10% teleworking and micromobility. SANDAG should provide direction on how this could be worked into General Plans that are updated every 5-20 years.	2. SANDAG will work with local jurisdictions on how to conduct modeling with the service bureau and how to factor in assumptions related to pricing, parking, teleworking, and micromobility.
L71	3. Appendix A: Transportation Projects, Programs, and Phasing: Trips to and from school sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools.	3. Both the Appendix A “Mobility Hubs” and “Policies and Programs” section include investments that would benefit school sites and school access. Within the “Mobility Hub” investments, there are Complete Streets assumptions to make streets safer for people who walk and bike by investing in traffic calming and pedestrian improvements. Under “Policies and Programs” the Plan includes in Vision Zero programming that prioritizes safety through roadway design while working with cities to develop community engagement programs that identify local street safety issues and provide technical guidance to resolve those issues through investment, policies, and programs.
L72	Table A.11: Given the proven success of the Carlsbad Connector microtransit pilot program, the city agrees with the Plan’s recommendations to provide similar on-demand microtransit systems throughout North County at all mobility hub sites and major transit centers.	SANDAG looks forward to coordinating with Carlsbad and other North County jurisdictions on microtransit systems.
L73	Table A.13: The segment of El Camino Real between Poinsettia Lane and Camino Vida Roble is proposed to be widened from two to three lanes to prime arterial standards. With the adoption of the city’s General Plan, the city has determined that the widening of this portion of El Camino Real is not feasible due to constrained right-of-way and would result in negative impacts to other travel modes. City staff recommend removal of this proposed project recommendation CB32 {that is, a ‘do nothing’ scenario, or appraise and evaluate different mobility projects and/or alternative designs}.	Complete Corridors, such as those planned for I-5 via Project IT CC004, provide a variety of travel choices and use technology to manage how highways and major roads are used in real time. They provide a balance of dedicated, safe space for everyone, including freight vehicles and people who walk, bike, drive, ride transit, and use Flexible Fleets. This will not only improve traffic operations and efficient operations along this corridor, but it will help to provide additional access while assisting the region in meeting its greenhouse reduction mandates. More information on Flexible Fleets can be found here: <a href="https://www.sdforward.com/mobility-planning/flexible-fleets">https://www.sdforward.com/mobility-planning/flexible-fleets</a> .
L74	4. Active Transportation: The city appreciates the Regional Plan’s overall approach of providing a connected network of high-quality bicycle facilities throughout the region. Regional bikeways are recommended throughout the city including along Palomar	SANDAG will work closely with the City as active transportation projects advance into project-level design to ensure the project meets the needs of the corridor. SANDAG appreciates suggestions for improving

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>Airport Road which will provide a key east-west connection and El Camino Real which will provide a new north-south bikeway connection through the city. Both roadways are proposed to include “on-street bikeways”. Due to the high traffic volumes and vehicle speeds experienced along most of both corridors, the city recommends considering “off-street bikeways” or Class I facilities where feasible in order to stimulate the shift from personal motor vehicle use to people choosing to bike.</p> <p>It is extremely important that municipal transportation plans align with regional transportation plans to achieve regional goals for land use and transportation and to promote the region working together to build a cohesive regional transportation network. Considering there are currently no mechanisms in place to ensure municipalities coordinate local transportation plans with regional planning documents, the Plan should provide an approach on how SANDAG plans to engage with municipalities, especially in areas of potential disagreement or conflict (as aforementioned in this subsection and others). It is also recommended that the Plan provide additional direction regarding the application of protected bikeways in a variety of applicable contexts. While vertical measures such as soft hit posts may be appropriate in lower volume and lower speed roadways, arterial roadways with high traffic volumes and high speeds warrant much more substantial physical protection from vehicles. In addition, special consideration should be given at intersections and driveways which may be impacted due to the additional width and visibility impacts created by protected bikeways.</p>	<p>coordination with municipalities and will consider these as it develops programs and policies to implement the Regional Plan.</p>
<b>City of Coronado</b>		
L75	<p>First, and most notably, during the South Bay to Sorrento Comprehensive Multimodal Corridor Plan (CMCP) engagement process, City staff expressed concern about the Orange Avenue Business District / village area being designated a Mobility Hub without meaningful engagement with City residents and the City Council. It is highly unlikely the City would agree to construction of a new mobility hub in the Orange Avenue corridor. Therefore, the City requests the mobility hub be removed from both the South Bay to Sorrento CMCP and the 2021 Regional Plan.</p>	<p>Coronado is a major destination due to its location adjacent to one of the region’s top military bases. Additionally, people commuting to hospitality, retail, and dining jobs is a daily occurrence, and the community serves as one of the region’s top tourism destinations for visitors from both outside and within San Diego County. These trip inducing factors contribute to the area’s high propensity for regional mobility hub designation.</p> <p>Not all mobility hub areas are created equal, and they don’t all require construction of a major transit center. Coastal mobility hubs similar to others in the North County area are envisioned to rely upon some transit services supported by an array of on-demand Flexible Fleets to help people complete short trips in and around the hub without needing to rely on a car.</p>
L76	<p>As stated in the City’s “Comments on the South Bay to Sorrento Comprehensive Multimodal Corridor Plan” letter dated July 7, 2021, the City has about 23,639 residents (ACS 2019) and a compact, fully developed village area covering about two square miles surrounded by the San Diego Bay and the Pacific Ocean. The City is highly constrained and does not have additional development capacity or any buffer zones to establish a mobility hub in our village area. While the City is supportive of on-demand travel options, it is difficult to imagine where facilities for the “Flexible Fleets” and “Transit Leaps” might be sited, such as ride hailing zones, electric vehicle charging stations, micro-mobility parking areas, parcel delivery lockers, and sidewalk delivery bots. The description of mobility hubs also includes drone technology, which is a concern given the proximity to Naval Air Station North Island (NASNI).</p>	<p>SANDAG staff will continue to coordinate with the City on planning for appropriate mobility hub services, amenities, and supporting technology for this community.</p> <p>The suite of Flexible Fleets and supporting Mobility Hub amenities as included in the 2021 Regional Plan can be tailored to meet the needs of people traveling to and within Coronado. These features would enhance connections to transit (including the ferry) or help shift shorter, drive alone trips to alternative modes. It’s vital to understand that a variety of personally owned micromobility devices such as electric-assist bikes, scooters, and other motorized rideables are included in this category of options. Such devices are becoming increasingly popular among youth and adults alike. Since Coronado attracts so many residents from other parts of the region in addition to out of towners, it will be important to consider the provision of amenities like secure micromobility storage for these personally owned devices at or very near popular destinations.</p>
L77	<p>The designation of the City’s village as a mobility hub is also concerning as it relates to the future of housing allocations for Coronado. Presumably, given the State and SANDAG’s priority to increase housing density in transit rich areas, mobility hubs and related transportation investment may have a significant adverse impact in Coronado’s village area. The 2021 Regional Plan refers to mobility hubs as areas “to concentrate future development.” The City is concerned that the designation of the village area as a mobility hub will lead to continued increased regional housing needs allocations, which will negatively impact the City’s character, in addition to the challenge of space and regulatory limitations to accommodate more high-density housing.</p>	<p>Coronado is a major destination due to its location adjacent to one of the region’s top military bases. Additionally, people commuting to hospitality, retail, and dining jobs is a daily occurrence, and the community serves as one of the region’s top tourism destinations for visitors from both outside and within San Diego County. These trip inducing factors contribute to the area’s high propensity for regional mobility hub designation.</p> <p>The 6th Cycle Regional Housing Needs Assessment (RHNA) Plan, adopted by the Board of Directors and approved by the California Department of Housing and Community Development, includes a methodology which allocates housing throughout the region near jobs and transit. Consistent with state law, the RHNA process occurs about every 8 years. During the next RHNA process, the Board of Directors will again consider a methodology for allocating housing throughout the region, which may be different from the 6th Cycle methodology.</p>
L78	<p>In the event that the village area continues to be designated as a mobility hub, the City asks that the use of drone security be removed from the plan due to privacy and safety concerns, that the use of e-bikes or scooters be limited and orderly, and that new facilities not block or impede pedestrian movement. Finally, before any strategies are implemented within the village area, more public outreach and interagency collaboration will be required to inform Coronado residents of the plan.</p>	<p>SANDAG will work closely with Coronado staff before any strategies are implemented within the village area. Drone technology is referenced in the plan as something the private sector is exploring for use as last-mile delivery. SANDAG intends to coordinate with local jurisdictions and the private sector on potential applications and policies to guide the use of drone technology.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L79	<p>In addition to the City's concern for a mobility hub in the village, the City finds that the 2021 Regional Plan presupposes that 2021-2029 RHNA is finalized although there is pending litigation related to the RHNA. To address this issue, the City asks that the following language be inserted as a footnote on p.33 of the 2021 Regional Plan, after the sentence: "The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation" to read:</p> <p>In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board's adoption of the RHNA Plan. SANDAG demurred to the cities' Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition, and that appeal remains pending in the Fourth District Court of Appeal.</p>	This language has been added to the introductory pages of Appendix K, Regional Housing Needs Assessment Plan.
L80	<p>In addition, the City proposes to add the following paragraph to the end of p.14 of Appendix K:</p> <p>On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL, against SANDAG and SANDAG's Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and decide the cities' appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG's denial of the cities' RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities' RHNA appeals. On February 5, 2021, SANDAG's demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board's adoption of the RHNA Plan cannot be considered final.</p>	Similar language acknowledging the pending litigation has been added to the introductory pages of Appendix K, Regional Housing Needs Assessment Plan.
L81	A new Rapid route is depicted from Downtown to NASNI. The City would be interested in extending this route further into the commercial village area.	SANDAG, MTS, and the City can explore extension of the Rapid route from Downtown to NASNI for consideration in the next Regional Plan.
L82	The description of the Transportation Demand Programs includes language that suggests that employers will be required to provide transportation benefits. The City does not support requiring local businesses to provide specific benefits and would not enforce this or any other mandatory regulatory actions.	The 2021 Regional Plan proposes a Transportation Demand Management Ordinance and a near-term implementation action would be to complete a Transportation Demand Management Ordinance Policy Analysis. This policy analysis would detail the employers that the ordinance would apply to and mechanisms for enforcement.
L83	Appendix A identifies a new off-street bike path on Glorietta Boulevard. The City's Active Transportation Master Plan does not identify such a future improvement, the Bayshore Bikeway Plan recommends no changes to this area, and there is already a bike lane on Glorietta Boulevard. Please update A.12 and A.13.	<p>These projects were approved by the SANDAG Board of Directors in 2010 with the development of a comprehensive regional bike network - Riding to 2050: The San Diego Regional Bike Plan and these Class I Bayshore Bikeway segments were identified again and prioritized in 2013 via the SANDAG Early Action Program (EAP).</p> <p>More information can be found at the following links:  <a href="https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail</a>  <a href="https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail</a></p>
L84	In Appendix B one of the strategies to increase housing affordability is to minimize zoning near transit. Since most of the village area is near transit, the City would not implement strategies that adversely alters its community character through reduced zoning requirements or eliminated single family zoning.	While this is a strategy to increase housing affordability and reduce vehicle-miles traveled, land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the Regional Plan through understanding of the unique needs of their communities and geographies.
L85	In the land use maps in Appendix F, there are some areas of Coronado shown as mixed use. Although there is some existing, non-conforming mixed-use development in the City, there are no areas in the City that are zoned for mixed use, and there are no plans to zone additional areas for new mixed-use.	The SCS land use pattern assumes mixed use development to accommodate future growth and development in the mobility hub areas. Implementation of the land use pattern is to be refined through coordinated planning with the City as zoning authority is reserved to local jurisdictions.
L86	The City generally supports improvements to the public transportation system, but encourages SANDAG to do so in a manner that does not compromise necessary road maintenance and improvement projects.	SANDAG is committed to working collaboratively with stakeholders, peer agencies, and the City in the development, deployment, and operations of new regional transit services in order to identify and mitigate issues (including coordination with other projects within the same or similar boundaries).
L87	The City also supports new waterborne transportation options, such as ferry routes, and encourages SANDAG to prioritize the financing and expansion of waterborne transportation options in its regional planning documents.	SANDAG is working with MTS and the Cities of San Diego and Coronado on exploring grant opportunities to plan and fund ferry transportation for possible inclusion in the next Regional Plan.
<b>City of Oceanside, Planning Division</b>		
L88	We applaud SANDAG for prioritizing public safety, solutions to traffic congestion, social equity, GHG emission reduction, and air quality. We recommend that SANDAG also acknowledge open space and natural habitat preservation as a key priority of the Regional Plan. The long-term sustainability of the San Diego region, along with the quality of life of its	Both Chapter 2 and Appendix AA include information about open space and natural habitat preservation in the San Diego region.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	residents, depends on the preservation of these resources. How will the San Diego region help to further the state's "30 by 30" goal, as outlined in Executive Order EO N-82-20?	
L89	We encourage SANDAG to consult with the scientific community on the most recent sea level rise projections for the region's coastline. It is our understanding that NASA now projects sea level rise of less than one foot by 2050, based on roughly three inches of sea level rise over the past decade. While there are many factors that could contribute to significantly greater sea level rise over this period, we believe it important to base regional planning efforts on the most likely sea level rise scenario	At this time, sea level rise guidance from the Ocean Protection Council is considered the best available science and projects 2 feet of sea level rise by 2050. As the science evolves, SANDAG will update its planning efforts to reflect the latest science and guidance for planning.
L90	The modest goals for mobility mode shift over the planning period (reducing SOV commutes by 18% and increasing transit ridership by 10%) do not seem commensurate with the major changes the Five Big Moves would bring to the region. What are the main impediments to achieving more ambitious mobility mode shift goals? What strategies, if any, are available to overcome these impediments?	The 2021 Regional Plan does not include mode shift goals, however, SANDAG's activity based model (ABM2+) estimates the mode shift performance of the proposed plan. The ABM2+ is a state-of-the-art tool for analyzing the transportation network, land use pattern, and other policies of the Regional Plan, however, it is based on the information we know today. There are many emerging technologies and future behavior changes that could impact mode shift in the future. SANDAG will continue to use best available data and research on mobility to inform future updates of the ABM and estimated performance of the Regional Plan. The mode share estimates from ABM2+ are reported for the entire region. We expect in areas of denser land use and a greater confluence of mobility options to have a greater than average modal change.
L91	The regional population forecast for this iteration of the regional plan shows substantially less population growth through 2050 than that projected in prior forecasts. Should this most recent growth forecast prove accurate, there will inevitably be less tax and user fee revenue to support the region's transportation system. To what extent has lower population growth, and concomitant lower regional funding, been factored into the economic analysis of the Five Big Moves?	The regional population forecast is intrinsically tied to several aspects of the Regional Plan and is updated based on the latest forecasts from the California Department of Finance for each update of the Regional Plan. Revenue estimates for gas tax, sales tax, and user fees account for this updated population forecast and related vehicle fuel consumption and vehicle miles traveled estimates from ABM2+. The funding strategy will continue to be updated and adjusted for each Regional Plan to reflect changing conditions.
L92	It is noted that over the next three decades 60% of the region's population growth will be among those who are 75 years old and older. How well do we understand the current and evolving mobility needs and preferences of this demographic, and how will transportation infrastructure and services be designed to accommodate these needs and preferences? How will the region's elderly population benefit from active transportation improvements? How will the elderly access transit? What accommodations will need to be made to ensure that the elderly have equal access to the region's mobility network?	SANDAG has a long history of working closely with senior community members, social service providers, non-profits and community-based organizations to develop and fund specialized transportation services geared specifically towards the needs of seniors. The Regional Plan network includes a variety of modes that work together seamlessly to provide all San Diego residents, regardless of age or ability, access to multiple travel choices. Flexible Fleets are an example of an option that is particularly well suited for the senior population. Flexible Fleet options like ridehail, rideshare, and microtransit, offer a range of mobility options and vehicles that can accommodate many types of trips and meet the needs of various users. They can make it easy for seniors to access medical appointments and other basic needs without relying on a car. Flexible Fleet vehicles and services are adaptable and can offer personalized accommodations, such as wheelchair lifts, door-to-door services, and other options for people with physical limitations. SANDAG has conducted outreach and will continue to engage with seniors to ensure their mobility needs are met. In addition, SANDAG is developing a Flexible Fleets Implementation Strategic Plan that will address potential barriers to accessing Flexible Fleets, options for people without smartphones or internet, educational opportunities about how to access Flexible Fleets, and more.
L93	The Draft SCS establishes the overarching goal of a fast, fair, and clean mobility network. It will be important to devise and consistently apply appropriate metrics for evaluating how mobility improvements and services further this goal.  <ul style="list-style-type: none"> <li>• With regard to the relative speediness of new or enhanced mobility options, it would be worthwhile to consider how travel times associated with alternative modes compare with those associated with SOY automobile trips.</li> <li>• In addition to evaluating the fairness of a particular improvement or service in terms of access, cost, and functionality, it would be worthwhile to also consider the relative safety and comfort of mobility options as experienced by different user groups.</li> <li>• While air quality and GHG emissions are fundamental considerations in determining the cleanliness of the mobility network, so too are water quality, soil quality, hazardous materials, and solid waste management.</li> </ul>	Chapter 3 (Table 3.1) and Appendix E include information on the performance indicators for the 2021Regional Plan, which align with these suggested metrics.
L94	While user fees are both an important revenue source and a potentially powerful means of encouraging more sustainable modes of transportation, it is important that such fees not create financial hardship for lower-income households. To avoid a regressive and inequitable user fee regime, subsidies should be provided to those with both limited financial means and limited mobility options.	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. The study will also assess the potential impacts of user fees on different San Diego residents, visitors, and businesses. SANDAG is committed to developing a carefully constructed program that will promote equity and ensure that no particular group is disproportionately burdened. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system
L95	The efficient movement of goods into and through the San Diego region is essential to the health and stability of the regional economy. Assessment of the efficiency of goods movement should consider how delivery systems contribute to	The 2021 Regional Plan Appendix Y includes the 2021 Freight Gateway Study Update, which highlights freight flows within and to/from our region. SANDAG will be initiating the "San Diego and Imperial Counties

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	overall VMT and how these systems can further evolve to minimize their environmental impacts, including their contributions to traffic congestion, air pollution and GHG emissions, roadway wear -and-tear, and noise	Sustainable Freight Implementation Strategy” (Strategy) in early 2022 to identify regional strategies that transition the region to a more sustainable, efficient, equitable, and economically competitive freight transportation system. The projects and policies identified in this Strategy will be incorporated in future regional plans.
L96	Preparation and implementation of the sub-regional Comprehensive Multimodal Corridor Plans (CMCPs ) is identified as a priority in the Draft Regional Plan. Oceanside staff has been participating in task force meetings on the North County CMCP. In these meetings, we have noted that Caltrans facilities that extend through Oceanside often serve as barriers to active transportation and connectivity between neighborhoods. For example, SR 76 bifurcates neighborhoods in the San Luis Rey Valley, separating residents from commercial areas, recreational facilities, and other community assets. The absence of grade-separated crossings on SR 76 contributes to the highway’s impact as a physical and psychological barrier. The Planning Division recommends that improvements to SR 76, SR 78, and I-5 incorporate new and upgraded pedestrian and bicycle facilities that enable safer and more convenient crossings of these roadways.	<p>The North County Comprehensive Multimodal Corridor Plan (North County CMCP) is a strategic blueprint for identifying and implementing multimodal projects and services within North County communities. The North County CMCP work is using the Regional Plan to integrate the needs and projects identified where they align with sub-regional and regional transportation needs to reinforce the integrated system approach to meeting the diverse demands of North County’s communities.</p> <p>While there are not specific line items listed for within the 76 corridor, under the complete corridor concept for rural corridors like SR 76, the vision is looking into other strategies using technology and roadway operational improvements that could increase access, efficiencies, and safety by considering widening shoulders to allow safe passing lanes and rapid access to first responders, the use of technology (speed control, dynamic lane configuration using reversible lanes) to address crashes and increase capacity during evacuation routes with the use of real-time driver information in the event of fire or other natural disasters. Earlier phases of the 2021 Regional plan for SR 76 include approximately \$55 million proposed for the implementation of smart intersection technologies (2025 phase) and approximately \$222 million for operational and technology improvements (2035 phase).</p>
L97	To a large extent, the success of mobility hubs will depend on the level of comfort and engagement they provide to those who travel through them. The design of mobility hubs should therefore emphasize safety, security, accessibility, visual quality, and a strong sense of place. Mobility hubs have the potential to serve as gathering spaces, cultural venues, and entertainment districts. Improvements and services within mobility hubs should contribute to, and not detract from, the character and appeal of these areas.	SANDAG looks forward to working with the City of Oceanside, and all local jurisdictions, to implement improvements and services in mobility hub areas that meet the needs of the local community including strengthening a sense of place. Mobility hub success depends on featuring a mix of uses—everything from parks and plazas to dining and performance spaces—coupled with a variety of reliable and convenient ways to get there.
L98	It is noted that the Draft Regional Plan considers air pollution exposure reduction strategies promulgated by AB 805 and other state legislation and guidance. While most of these strategies rightly focus on underserved communities, it is important to note that as smart growth takes hold in the region and new housing is built in closer proximity to major roadways and transit facilities, residents across the socioeconomic spectrum could be exposed to excessive levels of air pollution. As we facilitate cleaner forms of transportation, we can also consider ways to enhance both indoor and outdoor air quality in highly urbanized areas through landscaping, ventilation systems, weather-stripping, etc.	These suggestions will be considered as we develop and implement programs related to smart growth, mobility hubs, and housing. The proposed 2021 Regional Plan is a high-level analysis of policies, projects, and programs and does not address specific details of building development such as landscaping, ventilation and weather stripping.
L99	State Route 76 is identified in the SCS as a “rural corridor.” While much of this highway extends through rural areas, most segments of SR 76 in Oceanside abut urbanized areas. Accommodating both pass-through and local trips, these segments of SR 76 could benefit from some of the same improvements and programming slated for other highways in the region.	The complete corridor concept for rural corridors like SR 76 includes strategies using technology and roadway operational improvements that could increase access, efficiencies, and safety by considering widening shoulders to allow safe passing lanes and rapid access to first responders, the use of technology (speed control, dynamic lane configuration using reversible lanes) to address crashes and increase capacity during evacuation routes with the use of real-time driver information in the event of fire or other natural disasters. Earlier phases of the 2021 Regional plan for SR 76 include approximately \$55 million proposed for the implementation of smart intersection technologies (2025 phase) and approximately \$222 million for operational and technology improvements (2035 phase).
L100	Consider Oceanside as a testing ground for the piloting of Next OS technologies, particularly those that serve lower -income residents and those who reside in areas with limited transit options.	SANDAG looks forward to partnering with the City of Oceanside to pilot Next OS technologies.
L101	In partnership with the Orange County Transit Authority (OCTA) and NCTD, consider rapid bus service between southern Orange County and the Oceanside Transit Center	The North County CMCP work is digging into the finer details of what is proposed in the Regional Plan and may propose additional Rapid Routes.
L102	The SCS calls for implementation of “innovative demand and system management” programs. The City of Oceanside has recently adopted TOM standards for new non-residential development of certain types and scales. The City is also exploring possible incentives for TOM in existing non-residential development. Regional funding and/or technical support for TOM plans would be a powerful incentive for existing businesses to consider ways to promote alternative commuting options.	SANDAG’s Transportation Demand Management (TDM) program currently offers jurisdictions and developers technical support and resources for implementing local demand/system management strategies. Most recently, SANDAG developed the Mobility Management Toolbox to help jurisdictions and developers evaluate the potential Vehicle Miles Traveled (VMT) benefits of mobility management measures, including TDM and Transportation System Management (TSM). In addition, SANDAG’s TDM program works with over 200 businesses throughout the region to offer customized solutions that promote alternative commuting options.
L103	As other local jurisdictions have done, the City of Oceanside intends to reduce lanes and implement roundabouts within one of its major commercial corridors (Coast Highway). One of the biggest challenges to implementing “road diets” is maintaining adequate right-of-way for buses and ample curb space for flex fleet service. Regional guidance on road diet design that supports alternative mobility options, developed in partnership with regional transit and flex fleet providers, would be helpful.	SANDAG is considering the development of regional guidelines for designing Mobility Hub and Complete Corridor improvements, which could include specifications for curb space into the design process. Curb Management is included as one of the key policies in the Regional Plan, and SANDAG intends to partner with local jurisdictions and other necessary stakeholders to pilot curb space projects as part of a near-term implementation strategy. Deploying curb space pilots will be conducted in alignment with the deployment of Flexible Fleets, and pilot results can help inform best practices to follow regionwide.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L104	The proliferation of warehousing and distribution facilities in the San Diego region has major implications for land use, economic development, and climate mitigation. These facilities tend to occupy large tracts of land while providing relatively few jobs per acre. Vehicle trips generated by these facilities can contribute significantly to VMT and associated GHG emissions. We encourage SANDAG to consider guidelines and incentives that promote innovation in the warehousing and distribution sector (e.g., more efficient land use, zero-emission vehicle fleets, etc.).	SANDAG will be initiating the “San Diego and Imperial Counties Sustainable Freight Implementation Strategy” (Strategy) in early 2022 to identify regional strategies that transition the region to a more sustainable, efficient, equitable, and economically competitive freight transportation system. SANDAG will consider these suggestions when developing this Strategy and will work with our local partners on vetting the Strategy’s recommendations. The projects and policies identified in this Strategy will be incorporated in future regional plans.
L105	Value pricing of public parking facilities is key to facilitating efficient use of these resources, generating revenue for local transportation improvements, encouraging alternative modes of transportation, and motivating efficient use of private parking facilities. While parking pricing is largely within the authority of local jurisdictions, SANDAG can support localities in navigating the technical and political challenges of implementing value pricing programs.	Parking Management is one of the key policy areas included in the Draft 2021 Regional Plan. As part of the Regional Plan, SANDAG has designated program funding towards working with local jurisdictions to implement parking management strategies such as parking pricing. In addition, SANDAG develops technical resources to provide jurisdictions with guidance on implementing parking policies, such as the 2014 Parking Management Toolbox. One of the Regional Plan implementation strategies includes updating the Toolbox to account for newer modes and more flexible curb space strategies.
L106	Performance monitoring, as illustrated in Table 3.1, should include public health benchmarks, particularly those that provide insight on the public health impacts of air pollution, lack of access to healthy food, sedentary lifestyles, etc.	SANDAG relies on partner agencies for tracking public health benchmarks, including the San Diego County Air Pollution Control District, San Diego Food Systems Alliance, and Health and Human Services Agency.
L107	In Figure A. 1, SR 76 and SR 78 are not identified as significant corridor geographies, while SR 56, SR 94, and SR 125 are identified as such. The Planning Division recommends that these two important regional roadways be identified in the same manner as other east-west highways in the region.	All corridors identified in the 2021 Regional Plan are critical and considered significant to ensure that the Regional Plan vision meet state and federal air quality mandates, reduce traffic congestion, and address social equity. Figure A.1 reflects the focus areas of the five Comprehensive Multimodal Corridor Plans (CMCP) that are currently under development, as well as the anticipated study areas for future corridor plans and the North Coast Corridor. SR 78 between I-5 and I-15 and the western portion of SR 76 are included in the North County CMCP and are shown in the orange area on Figure A.1.
L108	As identified in Table A.11, the Inland Rail Trail (IRT) through Oceanside is not shown as being implemented until 2035. The IRT is a crucial component of the North County bicycle trails network, facilitating access to NCTD Sprinter rail and Breeze bus services, connecting cyclists to the Coastal Rail Trail, activating north south bikeways (e.g., El Camino Real, College Boulevard), and contributing to complete streets improvements within the Oceanside Blvd corridor. The Planning Division thus recommends that the Draft Regional Plan commit to implementation of this segment of the IRT by 2025.	SANDAG is committed to completing the Inland Rail Trail. The Oceanside segment is identified as the final segment of the Inland Rail Trail to be completed, consistent with the Bike Early Action Program (EAP). SANDAG is actively pursuing opportunities to advance active transportation projects through grant funding, using Demand-Based Criteria to prioritize project implementation, and integrating bike projects into Comprehensive Multimodal Corridor Plans. Recently, the Board of Directors accepted \$12.057 million of Active Transportation Program Cycle 5 (ATP) grant funds for Inland Rail Trail Phase 4 (CIP No. 1223095). That funding will help SANDAG meet the very aggressive schedule to begin construction on this Phase by 2024.  For more information visit: <a href="https://www.keepsandiegomoving.com/RegionalBikeProjects/inland_rail_trail_intro.aspx">https://www.keepsandiegomoving.com/RegionalBikeProjects/inland_rail_trail_intro.aspx</a> .
L109	The Planning Division recommends that acquisition of land in mobility hub areas be identified as a higher priority, as property aggregation will be key to efficient redevelopment of many of these areas.	Some land acquisition may be necessary to implement elements of the regional mobility hub concept if future transit station locations are being proposed. SANDAG will work closely with the City of Oceanside should this need be identified. However, we also recognize near-term opportunities to work with existing rights-of-way at transit stations to retrofit curbside space for active passenger and small goods delivery in addition to siting supporting amenities like wireless electric vehicle charging, interactive travel kiosks, improved shelters equipped with WiFi, and more. Additional land use redevelopment opportunities may be identified in partnership with the private sector to convert surface parking to mixed land uses that integrate shared mobility service accommodations, for example.
L110	The extension of Melrose Drive and the interchange at Highway 78 and Rancho del Oro are not listed among the arterial improvements in Table A.13. Both of these improvements are listed in the City’s Circulation Element (CE). While the City is currently contemplating removal of the extension from Santa Fe Avenue to Spur Avenue from the CE, the unconstructed segment between North River Road and State Route 76 will remain	Table A.13 consists of near-term arterial projects that are included the Regional Transportation Improvement Program (RTIP) and require Air Quality Conformity analysis. The projects mentioned here are either not currently listed in the RTIP or have not programmed funding to a capital project phase and therefore are not listed.
L111	Implementation Action 9 calls for expansion of regional programs on low-carbon transportation options, roadway safety and maintenance, and nature-based climate solutions. While the Planning Division supports nature-based climate solutions where feasible, we note that certain stretches of the region’s coastline face imminent threat from coastal hazards and are not amenable to nature-based solutions. The Planning Division encourages SANDAG to support near-term coastal adaptation measures that address urgent local conditions and buy time for the development and implementation of long-range adaptation strategies.	The SANDAG Shoreline Preservation Working Group is a long-standing advisory group to the Regional Planning Committee on critical shoreline issues relevant to the region’s 70 miles of coastline, including the development of the 2021 Regional Plan. Paramount is continued support for the region’s ongoing and future beach nourishment efforts and other sea-level rise adaptation strategies.
L112	In addition to the enumerated strategies to increase housing availability and affordability (p. 19), the Planning Division encourages SANDAG to consider gap financing for inclusionary housing projects that do not qualify for tax credit financing and/or other federal and state subsidies. In determining eligibility for gap financing, SANDAG should consider key sustainability metrics - e.g., proximity to transit, employment, and essential services, energy efficiency and renewable energy sourcing, pedestrian-oriented design, resilient building materials, etc.	SANDAG is currently developing a Regional Housing Incentive Program and will take several factors into consideration to ensure the program meets the goals of the 2021 Regional Plan. The program will consider climate change and resiliency and consistency with transportation improvements included in the 2021 Regional Plan. Furthermore, SANDAG is developing a new grant program focused on accelerating housing production and have identified potential regional projects such as establishing a regional framework to potentially raise, administer, and allocate funding for affordable housing in the San Diego region. Additionally,

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
		SANDAG will be evaluating Board Policy No. 33 to establish a criterion for funding that is consistent with the 6th Cycle Regional Housing Needs Assessment, the proposed final 2021 Regional Plan, and aligns with state planning priorities.
L113	The Planning Division applauds SANDAG for recognizing that the relatively low resale value of certain electric vehicles presents an opportunity for lower-income households to enter the electric vehicle market. SANDAG can further support EV ownership in low-income and historically disadvantaged communities by coordinating with dealerships in the region on marketing and financing programs.	SANDAG will be developing a regional zero emission vehicle (ZEV) incentive program to help low- and moderate-income households purchase electric vehicles. The program is to support the purchase and/or lease of over 100,000 ZEVs by 2035. As part of the program design and implementation, SANDAG plans to engage with car dealerships and/or car associations, as well as coordinate with other vehicle incentive program administrators to enable consistent messaging and information for residents, dealerships and other stakeholders. These incentives will be in addition to other financing and incentives available in the region. As part of the ZEV incentive program development, SANDAG also will explore opportunities to incentivize secondary market (used) vehicles.
L114	The “Fix It First” implementation strategy is described as “bringing transit and road infrastructure back to optimal performance.” The Planning Division questions the notion that the region’s mobility infrastructure has ever demonstrated “optimal performance.” Perhaps a better catch-phrase here would be something akin to “Build Back Better,” as this speaks to more than just perpetuating the status quo.	Thank you for your comment.
L115	In its consideration of tools and strategies that provide for the effective operation and management of regional infrastructure as a coordinated system, SANDAG should work closely with local jurisdictions to identify, enhance, and integrate local data collection and traffic management programs into a regional whole. The City of Oceanside maintains a Traffic Management Center that, with adequate staffing, has the potential to provide real-time traffic data to support signal optimization and other efficiencies.	SANDAG looks forward to coordinating with Oceanside on data collection and traffic management programs.
L116	The Planning Division is concerned that the most recent iteration of the regional population forecast may significantly underestimate Oceanside’s capacity for additional population, housing, and employment. We understand that the statewide forecast prepared by the Department of Finance shows considerably less growth in the San Diego region over the next three decades than previously anticipated, and we acknowledge that population and housing growth in Oceanside has been declining over the past 20 years. Nevertheless, housing demand in Oceanside remains strong, and the City is still one of the most affordable housing markets in the San Diego region. Moreover, the local employment base continues to grow, particularly in the manufacturing, health care, and hospitality sectors. We believe Oceanside has the potential to accommodate significant growth through infill and redevelopment, and that the revitalization of the City’s urban corridors will draw new residents and employers. The City’s outdated General Plan has likely contributed to low growth projections over the past three forecast periods (2008, 2012, and 2016). The City is currently in the process of updating its General Plan, with the intent to incentivize infill and redevelopment through new zoning standards, a streamlined review process, CEQA clearance, and targeted infrastructure improvements.	SANDAG looks forward to continuing to coordinate with the City of Oceanside to incorporate its latest planning assumptions into future updates of the Regional Plan.
<b>City of Oceanside, Traffic Engineering Division</b>		
L117	SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. SANDAG should also clarify how comments on the plan are going to be addressed in the Draft EIR prior to its release.	The Draft EIR analyzes the draft Regional Plan. Comments and responses received on the Draft Regional Plan will be provided in the Final Regional Plan and inform the Final EIR. SANDAG’s schedule calls for the Board of Directors to consider EIR certification and adoption of the Regional Plan by the end of the year.
L118	Looking at the detailed data provided by SANDAG it is not clear why the citywide numbers only show moderate increases in population. See comments provided by the City’s Planning Division.	As noted in comments from the City’s Planning Division, the regional population forecast prepared by the California Department of Finance shows less growth over the next 30 years than previously anticipated.
L119	In Appendix A: Transportation Projects, Programs, and Phasing, it should be noted that Trips to and from school sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools.	Both the Appendix A “Mobility Hubs” and “Policies and Programs” section include investments that would benefit school sites and school access. Within the “Mobility Hub” investments, there are Complete Streets assumptions to make streets safer for people who walk and bike by investing in traffic calming and pedestrian improvements. Under “Policies and Programs” the Plan includes in Vision Zero programming that prioritizes safety through roadway design while working with cities to develop community engagement programs that identify local street safety issues and provide technical guidance to resolve those issues through investment, policies, and programs.
L120	Considering FHWA’s project for Accelerating Roundabout Implementation in the United States, and the County of San Diego Air Pollution Control Board’s support for implementing roundabouts to address GHG and reduce fatalities, the Plan should incorporate policies to promote roundabouts over signalized intersections and include a line item under the Complete Corridors to fund the construction of roundabouts at new locations and replace signalized intersections when found feasible.	Roundabouts, curb extensions, and similar traffic calming measures are included in the Mobility Hub complete streets investments as a means for slowing vehicular traffic in neighborhoods where a higher volume of multimodal travel to/from key destinations, particularly active transportation, is anticipated.
L121	Descriptions of the following projects are insufficient. In order to provide comments, the City requests that SANDAG provide more detailed project description, information and clarifications for the following projects:	For the projects listed in this comment (1-4) the cost estimates are a planning-level determination for designing and building an All Ages and Abilities bikeway facility type either on-street, or off. These estimates are based on the most recently completed SANDAG bikeway projects in \$2020 then applied consistently

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>1. AT030: Coastal Rail Trail Oceanside-Alta Loma Marsh Bridge 2035. The Regional Plan’s cost estimate is \$4 million. The actual estimate prepared by the City is \$9 million. Please clarify or correct.</p> <p>2. AT031: Coastal Rail Trail Broadway to Eaton 2035. The project cost is estimated at \$1 million. The Regional Plan recommends trail extension to Eaton Street, with Eaton providing connection to the existing Coastal Trail segment on Coast Hwy. The City’s preferred routing is to extend this trail to the south end of Broadway, then obtain easement from the Buena Vista Audubon Society to continue the trail along the lagoon to connect to the Carlsbad section of the Coastal Rail Trail. We recommend the project description be amended accordingly. We also believe that a higher cost estimate needs to be included; \$1M is not an accurate cost estimate for this project.</p> <p>3. AT049: Inland Rail Trail 2035. The project cost is estimated at \$68M. It is difficult to evaluate the accuracy of this cost estimate without a preliminary engineering study of the potential alignments and the actual field conditions. It is likely the cost of this project will exceed \$70M.</p> <p>4. AT074: Coastal Rail Trail-Oceanside Segment IALT 2050. The project cost is estimated at \$6 million, with on-street routing from Neptune/Pacific to the NCTD station. It is difficult to assess this potential trail routing and the project’s impacts potentially creating a need for street widenings in that area.</p>	<p>throughout the region and phase years, again according to typical project schedules for SANDAG-led bikeways. We appreciate that the City of Oceanside has developed some more specific cost estimates for certain project segments or has recommendations for a methodology to determine the costs of other project segments (which may have different alignments) as well. At this stage, the estimates we are providing are merely a first-step as any of these projects which are identified for inclusion in the Regional Transportation Improvement Program (RTIP) will receive a closer look and more specific coordination for budget estimation and the programming of appropriate funding to advance a project through the planning, design, and/or construction phases.</p>
L122	<p>5. The City requests that the following two projects be added to the Regional Plan:</p> <p>A. A connection between the west and east side of 1-5 at the SR-78 interchange for bicycle and pedestrian traffic. Under existing conditions, there is no safe access for bicyclists and pedestrians across 1-5 in this area.</p> <p>B. Bike infrastructure improvements on SR-76, as repeatedly requested by Caltrans and the City of Oceanside.</p>	<p>A. While this alignment is not in the Regional Bike Network, there are opportunities for the development of protected bike network via “Complete Streets in Mobility Hubs” funding, which is intended to fund retrofits to facilitate short trips of less than 3 miles in a safe and comfortable way to make it easier and more attractive to choose active transportation. This connection you’ve described falls within the Oceanside Mobility Hub.</p> <p>B. Parallel and in close proximity to this highway, the Regional Bike Network serves this corridor and destinations via the All Ages and Abilities existing facilities along the San Luis Rey River Trail which is proposed for extension as project AT113 specifically.</p>
L123	<p>The recommendations made in this section are the results of a conceptual community workshop on what might be considered, and the following recommendations mentioned in this appendix as</p> <p>a result of this workshop shall by no means be construed as the City of Oceanside’s official request and/or recommendations:</p> <ul style="list-style-type: none"> <li>• Oceanside Boulevard reduced to two lanes with protected bikeways.</li> <li>• The Strand closed to vehicle traffic and available only for bikes and pedestrians.</li> </ul>	<p>The Network Planning Workshop was considered an exploratory exercise and the summary memo includes the following language on page 9: “Disclaimer: The principles presented in this workshop are not intended to be fully developed policies, but rather inspiration for an integrated approach to safe and active mobility network solution. Similarly, the workshop outcomes included may not meet local practices and are not intended to be implemented networks, but rather conceptual prototypes to better understand the active transportation network process.”</p>
<b>City of Poway</b>		
L124	<p>Regarding Scripps Poway Parkway, the City of Poway would like to see vehicle, bike, pedestrian and transit infrastructure improvements and connections to be added from the Highway 67 through Scripps Poway Parkway to the I-15 Freeway. I have spoken to several property and business owners within the South Poway Business Park (SPBP) including Geico and parking is a constant issue. There is currently no public transit route into the SPBP. Having public transit, bike, pedestrian and highway/road improvements/connections providing better more efficient access to the SPBP is essential for future employment growth in the area. Many workers in the Poway area live in Ramona and East County and this is a vital connection for the City and the Region. SANDAG has also identified Scripps Poway as a Tier 3 employment center in their draft Employment Center analysis. Construction is also underway to add thousands of more employees in the SPBP. To be clear, we are recommending that Scripps Poway Parkway become a critical connection and a multimodal corridor (<a href="https://www.sandag.org/uploads/publicationid/publicationid_4720_28341.pdf">https://www.sandag.org/uploads/publicationid/publicationid_4720_28341.pdf</a>).</p>	<p>The San Vicente Comprehensive Multimodal Corridor Plan (CMCP) effort is currently underway. The CMCP will include a suite of solutions for consideration in future planning, implementation, and improvement activities along the corridor, including Highway 67 connections with Poway Road and Scripps Poway Road, respectively. The CMCP will include active transportation, clean transportation, transit, resilience and environment, right-of-way and utilities, equity, and evacuation considerations. The CMCP stakeholder working group includes representation from the City of Poway, which is intended to integrate jurisdictional priorities into the suite of solutions within the boundaries of the CMCP planning area.</p> <p>Your comment has been forwarded to San Diego Metropolitan Transit System (MTS).</p>
L125	<p>Regarding the Hwy 67, please note that the City of Poway’s General Plan Transportation Element includes a multi-use path on the west side of SR-67 (reference p. 3 <a href="http://docs.poway.org/weblink/0/doc/50446/Electronic.aspx">http://docs.poway.org/weblink/0/doc/50446/Electronic.aspx</a>). This multi-use path would include a separated two-way bike path and a fenced DG equestrian trail. The multi-use path provides a critical and safe pathway for hikers, bikers, runners, walkers, children, and equestrians. A multi-use path also creates a necessary loop between the City’s Iron Mountain trailhead and other destinations (e.g., Mt. Woodson, Lake Poway) which is also a goal within the Transportation Element. We recommend the San Vicente corridor plan is consistent with the City’s plans.</p>	<p>The San Vicente CMCP will consider all relevant and related plans and projects, in collaboration with City of Poway staff, to ensure there is cohesion and consistency between the CMCP and the communities within and adjacent to it, including active transportation considerations.</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
L126	State Route 67 is also designated as a scenic roadway by the Poway General Plan. As a part of the General Plan requirements, a 50-foot wide landscape open space easement is required from adjacent property owners from the ultimate right-of-way line along State Route 67 when development is proposed. This easement shall be landscaped and modified as needed to enhance the scenic quality of the area as discussed in the General Plan Transportation Element Policy B – Scenic Roadways. Providing scenic roadway elements to the design will also help the corridor be more compatible with surrounding open space. To contribute to the General Plan goals, we would suggest that the right-of-way incorporate design elements consistent with a scenic roadway (e.g., naturalized decorative solid walls, native landscaped medians and shoulders, additional landscape areas and trees where feasible, earthen berms).	The CMCP study identifies ways to improve roadway safety, enhance the urban-rural transportation interface (with special consideration given to limiting impacts on surrounding environmental habitats and wildlife), engage with tribal nations, and create greater trip reliability and efficiency throughout the study area while supporting climate action initiatives. The suite of solutions will include active transportation, clean transportation, transit, resilience and environment, right-of-way and utilities, equity, and evacuation considerations. The City of Poway is an integral member of the stakeholder working group and in the development of the CMCP.
L127	As discussed, a multi-modal transportation system provides users transportation options and choices and thereby reduces traffic congestion and GHG emissions. Regional multi-use paths have been a great asset to communities across the country. Here in San Diego, the SR-56 Bike Path is separated from the highway and is often used by runners, walkers, and equestrians. In contrast, it is uncommon to see bikers, walkers, and equestrians in a bike route adjacent to a highway (for instance, SR-76). A multi-use path is also kid friendly because of the separation from the highway and kids are often seen on the SR-56 Bike Path and not commonly seen within bike routes adjacent to a Highway. The multi-use path also accommodates a more rural aesthetic and is safer for users. Multi-use paths have become a critical component to the transportation system and are treasured by the communities they are a part of. The addition of the multi-use path along Hwy 67 is more consistent with the goals and policies of the 2050 RTP. We recommend the San Vicente corridor plan provides a separated mixed-use path throughout the full length of the corridor.	The San Vicente CMCP will consider all relevant and related plans and projects, in collaboration with City of Poway staff, to ensure there is cohesion and consistency between the CMCP and the communities within and adjacent to it, including active and multi-modal transportation considerations.
L128	Lastly, during the workshop portion for the Draft 2021 Regional Plan, workshops were provide by area (North, East, Central, etc.). Based on the mapped areas shown, Poway residents and community stakeholders were not represented as a part of any region and that outreach with appropriate comment period should be provided prior to moving forward with Draft. I'd be happy to assist you with what an appropriate outreach should be.	The virtual open house held on June 16, 2021 was titled County Unincorporated and included connections to adjacent cities, including Poway. In the future, we will be clearer about areas covered in each sub-regional workshop.

**City of San Diego**

L129	I am writing to express the City of San Diego's support for SANDAG's San Diego Forward: The 2021 Regional Plan (2021 Regional Plan). The 2021 Regional Plan is a major step towards reducing vehicle miles traveled by single occupant vehicles and greenhouse gas (GHG) emissions in the region by incorporating five transformational strategies which will be critical to enabling the City of San Diego to implement its Climate Action Plan. The City applauds SANDAG's commitment to making infrastructure and technological investments in the mobility system with a greater emphasis on accessibility, transit, bicycling, and walking as well as innovative and bold strategies to manage demand on regional roadways prioritizing safety and aligning with the City's commitments to Vision Zero. The City's General Plan is consistent with the 2021 Regional Plan as both focus on development within vibrant mixed-use village centers served by high frequency transit. The City supports the 2021 Regional Plan's intent to preserve open space from non-sustainable development. The City looks forward to closely working with SANDAG to implement the strategies described in the 2021 Regional Plan.	Thank you for your support of the 2021 Regional Plan. SANDAG looks forward to working closely with the City of San Diego to implement the strategies of the plan and achieve our shared goals.
L130	The City supports the 2021 Regional Plan's vision to improve the transportation network in the region especially the planning and implementation of a complete network of efficient, convenient, and reliable transit services that connect people from where they live to where they work or go to school. The development of a dynamic management system of traffic flow and transit services, facilities for bicycles, scooters, pedestrians, and flexible micro transit, offer an equitable approach to first and last-mile connections to transit, a vision zero strategy to address safety, and implementation of the City's Climate Action Plan.	SANDAG looks forward to collaborating with the City to implement the 2021 Regional Plan and support implementation of the City's Climate Action Plan.
L131	The City also supports the 2021 Regional Plan's development of mobility hubs throughout the region. As part of our land use planning efforts, the City is providing policies to support the implementation of mobility hubs as vibrant centers of activity where future housing and employment growth are connected by transit. The San Ysidro and Central mobility hubs are critical transportation facilities and having a direct connection to the U.S.-Mexico Border and San Diego International Airport is a vital step towards having a transit system that meets the needs of residents and visitors.	SANDAG sees the City as a key partner in developing mobility hubs, including the critical facilities at San Ysidro and the Central Mobility Hub.
L132	The City shares the 2021 Regional Plan's goal to provide better transit access and housing opportunities in employment centers. Over the past two years, the City has adopted updated Mission Valley and Kearny Mesa Community Plans to accommodate more housing and existing and future transit improvements in high employment centers. We are also in the process of updating our community plans for University and Mira Mesa (Sorrento Mesa) which include major high-tech and biotech employment centers. These plans focus additional housing opportunities along existing and planned transit lines needed to support continued economic prosperity. Downtown San Diego has experienced a high level of residential growth as well as a recent resurgence of employment growth. The success of future housing and job growth in these employment centers is predicated on the implementation of rail	SANDAG agrees that the City's work to update community plans have been critical to advancing goals of accommodating more housing near transit and employment centers. We look forward to working together on integrated land use and transportation solutions.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	transit, managed lanes, and bicycle networks, and the technological improvements to our regional arterials. These investments into our infrastructure will also provide jobs for the region's skilled labor force.	
L133	The City strongly supports efforts to increase mobility options including the development of high frequency transit in communities of concern with increased transit infrastructure and service needed to provide convenient access to job centers. The City recommends that SANDAG identify the planning and engineering of the commuter rail (purple line) between San Ysidro and Sorrento Valley, separation of existing light rail at-grade crossings, dedicated and/or flex lanes for Rapid Bus routes within the City, as well as double tracking the LOSSAN corridor as shovel ready projects for future state and federal funding.	The 2021 Regional Plan includes the recommendations in this comment. SANDAG will continue to pursue state and federal funding for these projects.
L134	The San Ysidro and Barrio Logan communities are affected by truck emissions due to their proximity to the U.S.-Mexico border crossing and the Port of San Diego respectively. The 2021 Regional Plan addresses the needs for air, rail, and port goods movement and smarter border strategies to support trade and international commerce. The City supports San Diego Forward's goals and policies to reduced air pollution which are needed to meet federal air quality conformity requirements and improve some of our most underserved, low-income communities.	The 2021 Regional Plan includes strategies to reduce pollution exposure in disadvantaged communities. This analysis is attached to Appendix A of the proposed final 2021 Regional Plan.
L135	The City has a long history of planning together with SANDAG to creating a land use pattern and transportation network that facilitates greater mobility and increased connectivity between employment and housing. The City encourages SANDAG to continue funding the Smart Growth Implementation Program which provides needed grant funding for planning and capital projects that support the implementation of the Regional Plan. We have included additional recommendations attached to this letter for SANDAG's consideration and look forward to partnering with SANDAG on its new Housing Incentive Program to achieve the goals of the Regional Housing Needs Assessment Plan. We are committed and look forward to a continued partnership with SANDAG on the long-term implementation of the San Diego Forward: The 2021 Regional Plan.	The 2021 Regional Plan includes expanded funding for planning and capital grant programs for member agencies. SANDAG looks forward to partnering with the City on the Housing Incentive Program and other efforts to implement the Regional Plan.
L136	The City supports the planning and implementation of future rail projects identified in the 2021 Regional Plan. Appendix A, page A-15 on the note on the bottom of the page, please clarify if the purple commuter rail should be route 582 and not 581 as noted. Commuter rail route 581 as identified on page A-29, project TL-01 is Downtown to/from La Mesa projected to be in the 2050 transit network.	Thank you for this comment, this correction has been made.
L137	The future purple commuter rail connection would provide access for people throughout the communities within the southern and central portion of the City to employment centers in Kearny Mesa, University, and Sorrento Mesa. The City recommends considering alignment and station options that would serve the Mid-City communities and SDSU West at Mission Valley. We look forward to working with SANDAG in reviewing ridership information/forecasts based on different proposed alignments for the entire line including with and without stations serving the Mid-City communities and SDSU West.	SANDAG will be engaging with City staff during the advanced planning phase of the Purple Line which will finalize station locations and more ridership analysis.
L138	The City looks forward to working with SANDAG in evaluating options for grade separation of existing light rail at-grade crossings within the City.	Evaluating options for grade separations will be done in coordination with the City.
L139	The City recommends implementing near-term operational improvements such as the use of restriping for providing dedicated and/or flex lanes for Rapid Bus routes while planning for long-term capital improvements. We look forward to working with SANDAG in evaluating near-term and long-term options for dedicated and/or flex lanes for Bus Rapid routes.	SANDAG looks forward to working with the City to evaluate and implement dedicated and/or flex lanes for Rapid Bus routes. Many of the Rapid routes will be fully built in 2035 and 2050 as described in the tables in Appendix A, while some of the Rapid routes will be expedited to open sooner in 2025 with a "light version" (Phase 1). The light version of Rapid is meant to allow for a Rapid route to operate with minimal capital investment using existing bus stops. The full version of Rapid will build up the route's amenities with improved shelters, bus guideways, and/or other transit priority measures.
L140	The City recommends including the Via Las Cumbres/I-8 Interchange/Hotel Circle North & South/Fashion Valley Road project in the list of proposed projects in Appendix A. As a regionally significant project that provides freeway and active transportation connections to two light rail transit stations and the San Diego River Trail. This will support the recently adopted Mission Valley Community Plan which increasing housing opportunities near the existing light rail stations.	Interchange improvements along the I-8 corridor will be explored as part of the I-8 Comprehensive Multimodal Corridor Plan and during development of the I-8 Managed Lanes project. SANDAG will coordinate with the City on these efforts to ensure the needs of the Mission Valley community are met.
L141	While the City supports increasing the amount of Transit Priority Areas (TPAs), the City requests that the existing TPAs be maintained in the 2021 Regional Plan. The TPAs are a critical part of the City planning process for future development to help meet out Climate Action Plan goals for the reduction of vehicle miles traveled. Maintaining future transit routes and the TPAs provides consistency in our land use and mobility planning efforts.	The 2021 Regional Plan expands Transit Priority Areas (TPAs) and includes Mobility Hub areas that align with TPAs to facilitate future development that supports Climate Action Plan goals.
<b>City of Solana Beach</b>		
L142	· Mobility Hubs – Page 19 of Chapter 2 of the Draft Plan, the Sustainable Communities Strategy (SCS), describes planned "Mobility Hubs" as areas or communities in the region with "a high concentration of people, destinations, and travel choices" that "offer on-demand travel options and supporting infrastructure that enhance connections to high-quality Transit Leap services." While the SCS seems to acknowledge that these Mobility Hubs can vary both in size and transit	A map and descriptions of the five different Mobility Hub types has been added to the proposed final 2021 Regional Plan.

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>availability and can “span one, two or a few miles based on community characteristics,” the SCS and the Draft Plan do not separately categorize or discuss these Mobility Hubs based on these unique characteristics despite having done so previously as well as in Appendix T (Network Development and Performance). Pages 15 through 18 of Appendix T of the Draft Plan – Network Development and Performance – contains a Propensity Analysis for both Transit Leap Services and Mobility Hubs. These analyses identified which transit routes were most likely to meet the needs of transit riders now and in the future and which communities were most suitable for Mobility Hubs. While it should be noted that Solana Beach ranked at the lower end of both (see Figures 12 and 14), these analyses resulted in the apparent establishment of five (5) distinctive types of Mobility Hubs – Coastal, Gateway, Major Employment Center, Suburban and Urban Core – with Solana Beach identified in Figure 15 as a Coastal Mobility Hub. However, the SCS contains no meaningful discussion of these distinctive and unique Mobility Hub areas referring to them only in Figure 2.5 of the SCS where projected future growth is illustrated. The dramatic difference in projected future growth for each of these distinct Mobility Hub Areas, with Coastal Mobility Hubs well below the other four Mobility Hub Areas in both the percentage of future housing and future jobs (5% and 2%, respectively), clearly demonstrates their uniqueness with respect to jobs, housing and access to high-quality transit and the extent to which each area should be relied upon (or not) to satisfy the region’s future growth.</p> <p>The adopted 2021 Regional Transportation Plan (Adopted Plan) and the SCS should contain a detailed discussion of the five (5) Mobility Hub Areas and a description of the unique characteristics and transit needs for each – both now and in the future.</p>	
L143	<p>Additionally, by virtue of the fact that the Solana Beach Train Station is within 2 ½ miles of the cities of Del Mar, Encinitas and San Diego and the County of San Diego, this regional Coastal Mobility Hub Area in the Adopted Plan should, for purposes of planning for future housing and job growth, extend into and cover the City of Del Mar and the Del Mar Fairgrounds and areas of the cities of Encinitas and San Diego and the County of San Diego immediately adjacent to Solana Beach.</p>	<p>The coverage area of each regional Mobility Hub is based on a data-informed propensity analysis carried out in parallel with Transit Leap routing assessment. The analysis leveraged Census Block Group geographies to assess which areas were most conducive to hubs based on factors including current and forecasted population and jobs, proximity to major destinations, community of concern coverage, levels of short trip-making, etc.</p> <p>While these regional Mobility Hub coverage areas have been used to model the impact Transit Leap and Flexible Fleet trips to/from these hubs have on reducing vehicle miles traveled, they do not restrict Flexible Fleets from serving neighborhoods that may be between or beyond hubs. Some Flexible Fleet services operating within regional hubs will also need to reach outlying destinations like the set of beach and shopping communities cited in this comment. There will be many opportunities for Flexible Fleets to connect to Transit Leap stops located along routes in between hubs. The same applies to improvements on Complete Corridor arterials (e.g., Lomas Santa Fe, Via de la Valle) connecting to and from hubs.</p> <p>As SANDAG collaborates with cities on Regional Plan project and policy implementation in the years to come, conceptual mobility hub boundaries will be refined while taking into consideration city corridor and land use planning goals and policies, similar to what has already begun as part of the Comprehensive Multimodal Corridor Plans (CMCP) planning and design process. More detailed network-level analysis will be needed within each Mobility Hub to finalize detailed Transit Leap routing, Complete Corridor cross-sections, Flexible Fleet pilots, and supporting technologies.</p>
L144	<p>Transit Leap Services – As noted above, the Propensity Analysis discussed in Appendix T for both Transit Leap Services and Mobility Hubs determined that Solana Beach and its Train Station were at the lower end in the region both in meeting the needs of transit riders now and in the future and for suitability as a Mobility Hub. While the City acknowledges that the presence of the Train Station in Solana Beach might make it reasonable to include as a potential future Mobility Hub in the Adopted Plan, during the recent Regional Housing Needs Assessment (RHNA) allocation process, the City also made it clear that, both now and in the near term, the Train Station does not currently provide adequate Coaster or Amtrak headways, nor does it provide meaningful connections to other transit services to be considered a Mobility Hub now. Indeed, despite the North County Transit District (NCTD) Board recently voting to increase Coaster service beginning in October 2021, such a designation is still largely aspirational. While, again, the City acknowledges that the Draft Plan and the Adopted Plan are just that – a plan for the future – Appendix A of the Draft Plan – Transportation Projects, Programs, and Phasing – appears to support this position. Table A.5 (Interstate 5 North Coastal Corridor) identifies one Transit Leap project (TL40) – Rapid 473 – for implementation in the year 2035. Similarly, Table A.9 (State Route 56) identifies one Transit Leap project (TL026) – Rapid 103 – for implementation in the year 2050. These 15 to 30-year forward-looking Transit Leap projects, while helpful for the future, do not appear to satisfy the near-term objectives of a Coastal Mobility Hub.</p> <p>In order to justify the designation of the Solana Beach Train Station as a Coastal Mobility Hub, both now and in the future, more immediate Transit Leap service connections should be considered for inclusion in the Adopted Plan.</p>	<p>Flexible Fleets are envisioned to not only provide connections to existing and future Transit Leap services but also supply seamless on-demand travel options to and from regional mobility hub areas in the near-term. Given NCTD’s interest in transitioning some BREEZE bus routes to a more on-demand service model, there will be opportunities to pilot a variety of pooled ride and micromobility options prior to longer-term Transit Leap investments. Rapid 473 is slated to be implemented as soon as 2029, and the 103 in 2040 (2029 and 2040 are Air Quality Conformity phase years).</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
L145	<p>Appendix B: Implementation Actions – Appendix B provides detail on commitments and key actions to implement elements and strategies of the Draft Plan. Key to this objective is the involvement of and coordination with each member agency as they are most knowledgeable of the needs of their respective communities. Indeed, Near-term Implementation Action No. 2 in Table B.1 identifies the need to partner with local governments to develop five initial Comprehensive Multimodal Corridor Plans (CMCPs). Therefore, the City requests that the following minor edits to Appendix B (page 16) under “Land Use and Regional Growth” be included:</p> <p>“The 2021 Regional Plan vision for land use focuses on development and growth in Mobility Hub areas urbanized areas near jobs to preserve San Diego’s open space and support transportation investments by reducing vehicle miles traveled (VMT). Mobility Hubs are an opportunity to provide housing to address the Regional Housing Needs Assessment. Land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan through understanding of the unique needs of their communities and geographies. Because land use authority is reserved to local jurisdictions, SANDAG will leverage partnerships with cities and the county through the Smart Growth Incentive Program and other grants to provide funds for transportation-related improvements and planning efforts that support smart growth in Mobility Hubs to realize this their vision for their communities. SANDAG will continue its existing grant programs, partner with member agencies on state funding opportunities, and provide data and technical support to assist local jurisdictions with land use planning efforts in line with the 2021 Regional Plan.”</p>	<p>The proposed final 2021 Regional Plan includes similar edits to Appendix B that acknowledge the importance of coordination with each member agency on land use and regional growth given that land use authority is reserved to local jurisdictions.</p>
L146	<p>Regional Housing Needs Assessment – Following adoption of the Draft RHNA allocation by the SANDAG Board in September 2020, appeals of the allocation were filed by the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach. In order that these appeals are correctly noted for the record, there are two locations in the Draft Plan to which a clarifying footnote and additional language should be added to the Adopted Plan. Specifically, the City requests the following for the Adopted Plan:</p> <p>On page 33 of the Draft Plan, after the sentence: “The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation” the following footnote should be added:</p> <p>*In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board’s adoption of the RHNA Plan. SANDAG demurred to the cities’ Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition, and that appeal remains pending in the Fourth District Court of Appeal.</p> <p>On page 14 of Appendix K (Regional Housing Needs Assessment Plan), the following paragraph should be added to the end of this page/section:</p> <p>On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL, against SANDAG and SANDAG’s Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and decide the cities’ appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG’s denial of the cities’ RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities’ RHNA appeals. On February 5, 2021, SANDAG’s demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board’s adoption of the RHNA Plan cannot be considered final.</p>	<p>Similar language has been added to the introductory pages of Appendix K, Regional Housing Needs Assessment Plan.</p>
<p><b>Cleveland National Forest Foundation/Save Our Forest and Ranchlands</b></p>		
L147	<p>Therefore, SOFAR and CNFF urge the SANDAG Board of Directors to include a Climate, Housing, Transit Alternative in the 2021 RTP update—an alternative focused on meeting both the housing needs and greenhouse gas (“GHG”) reduction goals for a qualified land use area that have been set collectively by the State of California, the City of San Diego, and SANDAG:</p> <ul style="list-style-type: none"> <li>• 40% reduction in GHG below 1990 levels by 2030 (California AB 32 and SB 32)</li> <li>• 80% reduction in GHG below 1990 levels by 2050 (Governors Schwarzenegger and Brown)</li> <li>• 25% reduction in per capita GHG from passenger cars and trucks relative to 2005 by 2035 (California SB 375; California</li> </ul>	<p>The 2021 Regional Plan aligns with many of the elements of the Climate, Housing, Transit Alternative while meeting all legal requirements of the Regional Plan. As the 2021 Regional Plan is implemented, SANDAG looks forward to continuing to advance efforts related to climate, housing, and transit. Section 6.5.5 of the Draft EIR presents reasons why the Climate, Housing, and Transit Alternative was not evaluated in detail in the EIR. The 2021 Regional Plan proposes a land use scenario that accommodates the Regional Housing Needs Assessment and, when combined with the transportation system, allows the region to meet its SB 375 greenhouse gas reduction target. Analysis of the 2021 Regional Plan’s consistency with other California</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Air Resources Control Board1)                      • 14.3% reduction in total daily VMT per capita, and 16.8% reduction in total light-duty VMT per capita, relative to 2015-2018 average by 2050 (California Air Resources Board)2                      • 50% transit, walk and bike mode share for commuters within ½ mile of a major transit stop in City of San Diego by 2035 (Climate Action Plan, City of San Diego)3                      • 150% increase in transit mode share (SANDAG’s Urban Area Transit Study)4                      • Adequately plan to meet the housing needs of everyone in the community (California)5                      • SB 743 VMT reduction goals</p> <p>Meeting these goals is not only reasonable, but also urgently required if we are going to solve some of the unrelenting challenges faced by residents of San Diego. Indeed, SANDAG’s prior RTP was found to be deficient for failing to discuss an alternative which could significantly reduce total vehicle miles traveled (“VMT”) (Cleveland National Forest Foundation v. San Diego Association of Governments. (17 Cal. App. 5th 413, 435-437 (2017))). Heretofore, the San Diego region has met these challenges with clever words, not deeds. These goals are achievable only if land use and transportation are addressed together.</p> <p>These synergies are recognized in SANDAG’s Urban Area Transit Strategy and the City of San Diego’s General Plan Housing Element which includes this goal:                      Ensure the provision of sufficient housing for all income groups to accommodate San Diego’s anticipated share of regional growth ...in a manner consistent with the development pattern of the Sustainable Communities Strategy (SCS), that will help meet regional GHG targets by improving transportation and land use coordination and jobs/housing balance, creating more transit-oriented, compact and walkable communities, providing more housing capacity for all income levels, and protecting resource areas.6</p> <p>The Climate, Housing, Transit Alternative would pick up where SANDAG’s Urban Area Transit Strategy left off in 2011.</p>	<p>greenhouse gas reduction goals as well as an analysis of alternatives to the proposed 2021 Regional Plan are included in the Draft EIR for the Regional Plan.</p>
L148	<p>Real estate developers and their allies are currently pressuring San Diego County to retain its unlawful and inaccurate thresholds for assessing VMT impacts under SB 743, claiming that mitigation for VMT impacts will make housing in more remote parts of the County unaffordable. But housing in these areas is already unaffordable when transportation costs—that is, costs of driving long distances from locations not served by transit—are taken into account. SANDAG can help facilitate a better approach through the RTP, one that encourages the County to plan for housing in areas where transportation costs are low rather than allowing developers to build in remote areas and then trying to “mitigate” for the resulting VMT.</p> <p>The answer to housing affordability is H+T affordability. It is building more housing in the H+T affordable light-colored areas and in expanding the supply of H+T affordable areas through increased transit service.</p>	<p>The area’s indicated in the figure provided are well-aligned with the mobility hub areas identified in the 2021 Regional Plan. While land use authority is reserved to local jurisdictions, the 18 cities and the County, SANDAG will work closely with jurisdictions to incentivize building of housing in the mobility hub areas. In coordination with the development of the proposed 2021 Regional Plan, SANDAG will embark on developing a housing incentive program, which will support jurisdictions in the development and adoption of policies and process improvements to accelerate housing production. The program will also look for ways to leverage funding from the State of California to provide more housing in the region and meet the goals of the 2021 Regional Plan.</p>
L149	<p>...In the past, the housing allocations have been aspirational but not enforced. The State has signaled that it plans to be more aggressive about enforcement during this cycle. SANDAG can help the municipalities achieve their housing goals by shifting all transportation spending towards transit and non-motorized (walk and bike) infrastructure. These investments, which will facilitate getting people out of the cars, will also help the region increase density without large impacts on neighborhoods.</p>	<p>SANDAG is developing a Regional Housing Incentive Program to meet the goals of the 2021 Regional Plan and assist local jurisdictions in achieving housing goals. SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, and consider climate change and resiliency, availability of transit and active transportation, and consistency with the transportation improvements included in the Regional Plan. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p>
L150	<p>The recently-completed study concludes that the Miramar tunnel and rail line straightening would add a critical link to the LOSSAN rail corridor. See Exhibit #1 (Miramar Tunnel Feasibility Study).Critically, it finds that the feasibility criteria for the Miramar tunnel have been satisfied. Its specific findings include the following:</p> <ol style="list-style-type: none"> <li>1. The project would increase discretionary passengers by 1,300 to 1,700 per day, thereby reducing annual VMT 200 million to 240 million miles and GHG by 70,000 to 84,000 tons.</li> <li>2. The project would provide competitive travel times, including a transit system average clock time that is approximately 3% faster than the automobile.</li> <li>3. The project would be cost competitive, with transit riders cost at \$180/month versus automobile costs of \$507/month.</li> <li>4. The project has no fatal engineering flaws.</li> </ol> <p>The study further acknowledges a prior federal study that found construction of the Miramar tunnel along with other corridor improvements would reduce travel time between San Diego and Los Angeles to two hours. In short, construction of the new tunnel, which would provide enhanced access to downtown and the airport, would be a key transportation improvement for the region and the state. As the study notes, the LOSSAN rail corridor— together with the I-5 freeway – is the second-most traveled route in North America. The Miramar tunnel must be considered a key component of the Climate, Housing, Transit Alternative.</p>	<p>The Miramar tunnel is identified in the 2021 Regional Plan to support improvements to the Coaster and new commuter rail service.</p>
L151	<p>At the next level is a network of higher-speed, high frequency transit lines with separate rights of way and fewer stops. In many regions, a light rail service fills this niche, but in the San Diego region the Trolley has not filled this niche well. It</p>	<p>The 2021 Regional Plan proposes new commuter rail service and upgrades to existing light rail service, including grade separations and eliminating stops for express service.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	operates too slowly and service is not frequent enough. Improvements are needed in both these dimensions. Achieving the required level of service in this higher-speed tier will require a rethinking of the system. As part of the Climate, Housing, Transit Alternative, SANDAG should evaluate speeding up the existing lines through grade separations and eliminating stops, as well as creating new higher-speed lines.	
L152	Both the regional rail and higher-speed high-frequency tiers need to be well connected. The Climate, Housing, Transit Alternative must include an inter-modal terminal (Grand Central) connecting San Diego’s urban core, the Airport, the LOSSAN corridor, the Sprinter corridor, and the Trolley system.	The 2021 Regional Plan proposes a Central Mobility Hub to connect the urban core, the Airport, the LOSSAN corridor, Trolley system, and many bus routes.
L153	The Climate, Housing, Transit Alternative must also include efficient connections with frequent local buses (which could possibly be automated in the future). To this end, SANDAG must grapple with the first mile/last mile issue as this reflects a failure in land use and the existing transit system. While higher income travelers may have a choice of Uber-type services to solve this problem, this should not be viewed as a remedy for the average traveler.	The 2021 Regional Plan proposes an expanded network of Rapid buses and improvements to the local bus system to facilitate more frequent and longer spans of service. The proposed investments in Flexible Fleets will allow for more options to facilitate first mile/last mile connections to transit with solutions that can be customized for different communities (microtransit, ridesharing, bikeshare, etc.).
L154	Finally, the goal of a functional transit system is to serve an area-complete bike and walkable land use because no trip begins or ends on a transit vehicle. Most transit trips begin and end with a walk trip. In regions with high transit use, there are generally about twice as many walk trips as transit trips. Investments in walk and bike infrastructure should be a top priority. Consistent with the City’s Climate Action Plan, the Climate, Housing, Transit Alternative must model a 50% transit, walk and bike mode share for residents in the central core.	The 2021 Regional Plan proposes a land use pattern that focuses growth in the mobility hubs to align with transportation investments and facilitate more bikable and walkable communities. SANDAG is working closely with the City of San Diego to ensure the 2021 Regional Plan complements the City’s efforts to achieve the mode share goals of its Climate Action Plan.
L155	<p>Building a real regional transit network will require all the region’s transportation investment dollars for the foreseeable future. The Climate, Housing, Transit Alternative must not include any freeway expansion.</p> <p>The billions of dollars spent on freeway expansion the past 20 years have A) failed to reduce congestion, B) caused a substantial increase in VMT and GHG emissions, and C) resulted in a severe housing shortage. The transportation models used to justify these freeway expansion projects have been wrong on all counts. These models - both in the San Diego region and in regions throughout the U.S. – forecast dire increases in travel time if freeways are not widened, and substantial increases in travel time even if they are widened. In fact, as shown in Figure 9 (see attached letter for figures), travel time has stayed remarkably constant in the U.S. for decades. Figure 9 shows the “average time spent driving a private vehicle in a typical day.” There was an increase during the 1990s, a time when many women were joining the labor force, but since 2000 there has been little change. Time spent driving also is very similar across differently sized regions. There is evidence that people have a “travel time budget”. If travel speeds drop, they (on average) will adapt to travel a shorter distance. In contrast, if travel speeds increase, people (on average) will travel longer distances. This phenomenon is known as “induced travel”. In work for the California Air Resources Board (“CARB”), researchers at the University of California and the University of Southern California reviewed the literature on induced travel and concluded: Thus, the best estimate for the long-run effect of highway capacity on VMT is an elasticity close to 1.0, implying that in congested metropolitan areas, adding new capacity to the existing system of limited-access highways is unlikely to reduce congestion or associated GHG in the long-run. The SANDAG regional transportation model fails to account properly for induced travel although there now are newer algorithms that could address this deficiency. Senate Bill 743 establishes VMT as the appropriate metric for determining the impacts of transportation projects. This has made properly accounting for induced VMT critical in the regulatory process. The Office of Planning and Research’s (“OPR”) Technical Advisory on Evaluating Transportation Impacts in CEQA recommends: Whenever employing a travel demand model to assess induced vehicle travel, any limitation or known lack of sensitivity in the analysis that might cause substantial errors in the VMT estimate (for example, model insensitivity to one of the components of induced VMT described above) should be disclosed and characterized, and a description should be provided on how it could influence the analysis results. A discussion of the potential error or bias should be carried into analyses that rely on the VMT analysis, such as greenhouse gas emissions, air quality, energy, and noise. The National Center for Sustainable Transportation at the University of California at Davis has produced an Induced Travel Calculator to help address the deficiencies in the models. Recently, Caltrans also has issued new draft guidance on accounting for induced travel. It recommends following the OPR recommendations: Caltrans recommends using the VMT analysis approaches recommended in OPR’s advisory when evaluating the transportation impacts of projects on the State Highway System (SHS). Neither expanding freeways nor not expanding freeways will have any effect on regional congestion or average travel times. However, expanding freeways will cause significant increases in VMT and GHG emissions, and will continue to starve the transit system of needed investments.</p>	Appendix D of the 2021 Regional Plan includes an induced demand analysis (as required by the California Air Resources Board) to be factored into estimated 2035 greenhouse gas emissions. This analysis utilized the Induced Demand Calculator referenced in the comment.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L156	<p>Given that transit in the San Diego region has been and continues to be severely under-funded and under-built compared to roadway projects, as discussed above, the Climate, Housing, Transit Alternative must exclude roadway/freeway funding and expansion. Heretofore, SANDAG's planning has arbitrarily segmented freeway and transit projects. This artificial segmentation is not only irrational, it is fatal in achieving sustainable housing goals because transit, bike, and walk mobility and auto-based mobility serve contradictory land use purposes. SANDAG's failure to historically recognize this fundamental truth is the Achilles heel of its planning and lies at the doorstep of the agency's on-going inability to deliver a plan that truly unites our community on an ecologically sustainable foundation. It is abundantly clear that SANDAG's past planning efforts have not only been deficient but have repeatedly failed to heed the ominous warnings from the courts, the public, and the planet itself. With California literally on fire due largely to climate change induced drought and high temperatures, SANDAG has failed the public by not aggressively pursuing a transportation scenario that would meet the State's GHG and VMT reduction goals. The Climate, Housing, Transportation Alternative would help achieve targets set in legislation, the California Air Resources Board's Climate Change Scoping Plan, and relevant Executive Orders.</p> <p>Similarly, with regard to the local housing crisis, it is inconceivable that SANDAG's prior RTPs have not called for a 50% transit, bike, and walk mode share alternative necessary to activate infill housing, especially since the urban core is already zoned for such housing. Here too, the Climate, Housing, Transit Alternative would facilitate this infill housing and help the City of San Diego achieve the targets set forth in its Climate Action Plan.</p> <p>Additionally, the County's continued business-as-usual approach to planning makes the need for SANDAG to strengthen guidance regarding future development in the region all the more pressing. In spite of all the talk of a new direction, the County recently unveiled a plan update for the forest community of Alpine which can only be described as a VMT and ecosystem catastrophe. This planning contradiction was noted in Shute Mihaly's comment letter on the Alpine plan. The tectonic shift in regional transit mobility mentioned in the opening paragraph of this letter must become a reality soon to avoid irreversible damage to our wild lands and a missed opportunity for the region.</p> <p>Faced with these pressing social and environmental challenges, SANDAG's new regional direction can be strengthened by following established judicial, executive, and local legislative guidelines designed to meet the housing and climate crises. The public urgently deserves to see what it would take for the region to build a world-class transit system and to develop reasonably priced infill housing. Common sense dictates that the Climate, Housing, Transit Alternative would necessarily begin with a complete, first phase transit, bike, and walk system with an inter-modal terminal connecting the Airport, the Central Core, the LOSSAN Corridor, the Sprinter corridor, and the Trolley system. It is important to note that the Climate, Housing, Transit Alternative would not only be the "environmentally superior alternative", it would also be the socio-economic superior alternative because a true transit, bike and walk system reduces both the cost and shortage of housing and the cost of driving.</p> <p>In conclusion, in the face of a severe, entrenched housing crisis endangering the public welfare and the severe climate crisis endangering the planet, SANDAG owes the public nothing less than a transit alternative that immediately meets these life threatening challenges rather than artificially prolonging them.</p>	<p>The 2021 Regional Plan aligns with many of the elements of the Climate, Housing, Transit Alternative while meeting all legal requirements of the Regional Plan. As the 2021 Regional Plan is implemented, SANDAG looks forward to continuing to advance efforts related to climate, housing, and transit. Section 6.5.5 of the Draft EIR presents reasons why the Climate, Housing, and Transit Alternative was not evaluated in detail in the EIR.</p>
<b>Climate Action Campaign</b>		
L157	<p>Transportation accounts for nearly half of the region's emissions. To remain on track to achieve carbon neutrality, as climate science says is necessary, SANDAG must go further in exceeding CARB's target. We believe a reduction from transportation by at least 30% by 2035 is achievable and needed to ensure a climate-safe Zero Carbon future, and urge SANDAG to map out the strategies needed to achieve that target.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
L158	<p>Page A-51 of Appendix A proposes "subsidies to reduce the fares paid by transit riders." Appendix A should be amended to include an explicit commitment to Youth Opportunity Passes (YOP)—no-cost transit passes for youth 24 and under—and should be implemented immediately following the adoption of the 2021 Regional Plan. SANDAG should also commit to overseeing YOP in partnership with MTS and NCTD, to ensure successful implementation by the local transit operating agencies.</p> <p>Community based organizations have been fighting for YOP for nearly a decade, as it is an essential investment in our region's youth, providing access to education and early career opportunities, while fostering the next generation of sustainable transportation riders.<sup>3</sup></p> <p>We urge you to make YOP a top priority in the 2021 Regional Plan.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
L159	<p>Attachment 6 of Appendix T (Network Development and Performance), includes the "Performance Measure Results Tables." Page T6-6 includes mode share projections for the 2021 Regional Plan for the benchmark years 2025, 2035, and 2050 for peak period work trips, all day work trips, and all trips.<sup>4</sup></p>	<p>SANDAG has provided the requested data to Climate Action Campaign.</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>We request this same set of projections, but specifically for Transit Priority Areas, to be able to compare Climate Action Plan’s mode shift targets with the mode shift that will be achieved through the buildout of the plan.</p> <p>For example, the City of San Diego’s Climate Action Plan (CAP) set ambitious targets for the percentage of commuters travelling by bike, walk, and transit in Transit Priority Areas (18% by bike, 7% by walk, and 25% by transit by 2035)5, and we want to ensure our regional transportation goals and local transportation targets are meaningfully aligned.</p>	
L160	<p>To maximize mode shift away from fossil fuel cars and towards bike, walk, and transit, Transit Leap timelines must be expedited, and prioritized in the early years of the plan over Managed Lanes and Managed Lane Connector, which will yield an increase in vehicle miles travelled.</p> <p>Investments in commuter rail, light rail, and bus rapid transit infrastructure should be prioritized in Communities of Concern, to increase access to sustainable mobility options and connections to the region’s job centers. The climate crisis and environmental injustice have and will impact Communities of Concern first and worst. Historically underinvested communities are exposed to the region’s most dangerously polluted air from cars and trucks, and are left with disconnected transit trips or long, expensive car commutes. As such, we support the inclusion of “Social Equity Early Action Transit Pilots” as a mechanism to streamline immediate investments in the communities on the frontlines of these crises.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
L161	<p>Page A-26 of Appendix A states that the Del Mar tunnel will be complete by 2035. Currently, the 1.6 mile stretch of LOSSAN tracks in Del Mar is located dangerously close to the edge of the bluffs, and several bluff failures within feet of the tracks have occurred over the past 2 years alone.</p> <p>With the bluffs eroding at approximately 6 inches per year, and the ever-intensifying threat of sea-level rise due to the climate crisis, these incredibly dangerous bluff failures will only increase in severity and frequency, putting lives seriously at risk.</p> <p>Moving the tracks off the bluffs is essential to securing a long-term solution for the LOSSAN corridor, while preventing increased air pollution from shipping trucks, and ensuring economic prosperity for the region. To secure a climate-safe transportation system, we urge you to make the Del Mar tunnel a top priority, and urge for completion as soon as possible, no later than 2025-2030.</p>	<p>The Del Mar tunnel is a top priority for SANDAG. Planning work is underway with preliminary engineering and environmental phase expected to begin as soon as 2022 if funding is secured. SANDAG reviewed the timelines of other similar tunnel projects throughout North America and the 12 to 15 year timeframe is consistent with industry best practices. The 2021 Regional Plan identifies funding to kick start the environmental, design, and right-of-way phases of the Del Mar Tunnel project by 2025 with construction funding in the 2035 phase.</p>
<b>Columbus Club of San Diego, Inc.</b>		
L162	<p>Thank you for providing the public and businesses with the opportunity to comment on the draft Regional Plan. Our banquet hall is located in the City Heights community adjacent to the Webster neighborhood and along the Auburn Creek tributary of the Chollas Creek. We have been in business at this location for more than 50 years.</p> <p>The list of priority projects for our District 9 and District 4 service area are as follows:</p> <p>1. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles and Vehicles. The Home / Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94. The Home / Market connection was originally planned but delayed for racially motivated reasons. Decades ago the 94 Freeway was the Color Line barrier. The Home/ Market connection would reknit neighborhoods that were separated by the installation of the SR94 Martin Luther King Freeway.</p>	<p>While Home Avenue is not on the Adopted Regional Bike Network, we have included the nearby and parallel Chollas Creek Bikeways: North Fork - Bayshore Bikeway to University Bikeway and South Fork - Petway Park to Market Creek Plaza in the Regional Plan which will help improve some of the connections you’ve described. The project alignment and details can specifically be found in the updated data viewer and Appendix A’s tables and maps for quick reference in the forthcoming Final Regional Transportation Plan that will be presented to the SANDAG Board of Directors for adoption this fall.</p> <p>Your comment was forwarded to the City of San Diego.</p>
L163	<p>2. Completion of the Bus Stop &amp; Pedestrian Sidewalk System on Home Avenue-East of Fairmount Avenue. Sidewalks are generally absent on the North side of Home Avenue, East of Fairmount Avenue. Pedestrians must walk in the street and are exposed to dangerous high-speed traffic. Curbs are not marked for safety and to assist the proper parking, traffic movements, and access for Buses and the Disabled. The Bicycle route is not painted and warning ramps for the visually impaired are often not in place. Please fund and work with adjacent property owners to install enhanced bus shelters and amenities, along Routes 13 and 965. Bulbing, out at key intersections, should be funded to increase pedestrian crossing safety. Please consider installation of pedestrian safety sidewalk and street lighting along Home Avenue and Fairmont. Installation of better lighting would enhance safety and could tie the neighborhoods together into a more friendly and effective neighborhood</p>	<p>We encourage you to be involved with the in-progress CMCP for this area - the South Bay to Sorrento Corridor here: <a href="https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=611&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=611&amp;fuseaction=projects.detail</a>.</p> <p>The City of San Diego and Metropolitan Transit System are collaborating on that effort too and are the implementing agencies for these improvements you’ve requested. That said, our plan is a plan for the whole region, and our efforts are regional.</p> <p>Your comment was forwarded to the City of San Diego.</p>
L164	<p>3. Undersized Auburn Creek under crossings. Please fund the correction of undersized flood water under crossings at Fairmont and Federal Boulevards. The under crossings are no longer the proper size to carry the flood condition flows along Auburn Creek; because the creek has been channelized and the permeable storm water area fully developed. The</p>	<p>SANDAG consider stormwater, or urban runoff during the project development process and partners with regional transportation infrastructure owners and operators to manage stormwater from roads and highways in the region. For more information on stormwater, please see Appendix R of the 2021 Regional Plan. In</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	storm water collection conduits from adjacent streets are galvanized corrugated tubing that is aging and conducts storm water directly into this listed impaired waterway and the Bay.	<p>addition, the crossings referenced in the comment above fall within the City of San Diego's jurisdiction. This comment will be forwarded onto the City of San Diego's Stormwater Department.</p> <p>Your comment was forwarded to the City of San Diego.</p>
<b>County of San Diego</b>		
L165	Land use and transportation planning in the San Diego region is evolving to better address the most pressing issues of today, including climate change, quality of life, attainable housing, and social and economic inequities. The County has several planning efforts underway which prioritize addressing these issues, including the Regional Decarbonization Framework, the Climate Action Plan Update, the Electric Vehicle Roadmap, Office of Environmental and Climate Justice, and establishment of VMT thresholds. While independent of the Regional Plan, these efforts are aligned with the goals of the Regional Plan. County staff is interested in further understanding the regional growth modeling assumptions used within the Regional Plan and alignment with these County efforts.	SANDAG looks forward to continuing coordination with the County on planning efforts that align with the 2021 Regional plan, including the Regional Decarbonization Framework, Climate Action Plan Update, Electric Vehicle Roadmap, Office of Environmental and Climate Justice, and establishment of VMT thresholds.
L166	The County represents more than 500,000 residents who live within 34 unincorporated communities throughout the region. County staff would like to better understand how the Regional Plan will address transportation options outside of proposed mobility hubs for those communities. The unincorporated community of Ramona, for example, has a population of 36,000 residents, which is a larger population than the incorporated communities of Imperial Beach, Lemon Grove, Coronado, Solana Beach, and Del Mar.	While certain types of Flexible Fleets are envisioned to converge in more dense communities (e.g., micromobility, last-mile delivery), there are also Flexible Fleet services that operate outside of Mobility Hubs including unincorporated communities. These services may include on-demand rideshare, ridehail, carshare, and microtransit services. As an implementation action of the 2021 Regional Plan, SANDAG is conducting a Flexible Fleets Implementation Strategic Plan to determine the appropriate use cases and geographic locations that are best appropriate for Flexible Fleet services including unincorporated communities of the County of San Diego. In addition, the 2021 Regional Plan includes investments in broadband connectivity that will facilitate improved access to online services and on-demand mobility services.
L167	Less than 1% of the unincorporated area is within the proposed mobility hubs, which is where transit and on-demand travel infrastructure investment will be focused. The unincorporated north and east county communities represent a significant population with higher-than-average VMT in the region. Investment in public transit and other transportation options will make it easier for people to drive less, which results in decreased GHG emissions. However, investment outside of mobility hubs appears to be limited, which would make it difficult for unincorporated residents to use new transit service.	Investments in the 2021 Regional Plan for unincorporated communities include improvements to local bus service (increased frequencies and span of service) and Flexible Fleet services. Additional detail on the improvements to local bus service has been added to Appendix A. In addition, the investments in the mobility hubs also serve residents of the unincorporated area as many residents live near a mobility hub and will be able to access the transit system within a reasonable amount of time on a Flexible Fleet service, then be able to make use of the Rapid bus, light rail, or commuter rail systems.
L168	To promote greater equity, County staff see opportunities to expand the proposed mobility hubs to include adjacent unincorporated communities. When we overlay the proposed mobility hubs with the County's VMT efficient areas (using both the unincorporated and regional averages), North County Metro, Lakeside, and Spring Valley (Attachment B) are adjacent to what appear to be proposed mobility hubs. These unincorporated communities would benefit from additional access and investment associated with inclusion in adjacent mobility hubs, as these communities have few existing alternative options to driving.	The coverage area of each regional Mobility Hub represents a general area defined through a propensity analysis (detailed in Appendix T). The mobility hubs of the 2021 Regional Plan depict a framework that will be used to guide future collaborative planning efforts between SANDAG and local jurisdictions. In reviewing the County's suggestions, SANDAG agrees that the areas identified are appropriate to consider in future mobility hub planning. The areas identified also align with Transit Priority Areas. In the proposed final 2021 Regional Plan, mobility hub maps also reflect Transit Priority Areas to be more inclusive of these areas.
L169	County staff is also interested in understanding how Regional Housing Needs Assessment (RHNA) allocations would be assigned. For the current 6th RHNA cycle, which covers 2021 - 2029, SANDAG allocated 6,700 units for the unincorporated area, with a total housing forecast in the Regional Plan of 7,419 units through 2050 for the unincorporated area. This forecast projects the County's RHNA allocation of 6,700 units being met by 2029, with an additional growth of 719 units by 2035, and projects no further growth in the unincorporated area through 2050. Based on this forecast, it appears that beyond 2035, all future housing needs in the region from RHNA cycles would be allocated to and met by growth in incorporated cities.	<p>The 2021 Regional Plan accommodates the regional housing need determined by the Department of Housing and Community Development for the 6th Cycle RHNA. That determination specifically identified additional need resulting from a low vacancy rate, overcrowding, and housing unit demolitions in the region. The remaining housing projected through 2050 is based on the January 2020 vintage of the Department of Finance population projections. As described in Appendix F, additional assumptions used in developing the forecasted housing units include a gradual increase in the region's vacancy rate to 4% by 2040, identification of vacation rentals as unoccupiable units, and a decline in household size as the population ages.</p> <p>While land use authority is reserved to the local jurisdictions, land use patterns will directly impact GHG emissions from the transportation sector. "Specifically, where and how the State population grows will have implications on distances traveled and tailpipe emissions; as well as on secondary emissions from the transportation sector, including emissions from vehicle manufacturing and distribution, fuel refining and distribution, demand for new infrastructure (including roads, transit, and active transportation infrastructure), demand for maintenance and upkeep of existing infrastructure. Conversion of natural and working lands further affects missions, with the attendant impacts to food security, watershed health, and ecosystems. Less dense development also demands higher energy and water use" (2017 Scoping Plan, California Air Resources Board, p. 77).</p> <p>Government Code section 65080(b)(2)(B) requires that the SCS "set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board." The</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
		<p>SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan.</p> <p>The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.</p>
L170	In order to fulfill the goals of the Regional Plan in providing access to affordable, reliable, and safe mobility options for everyone in the region, County staff would like to work with SANDAG to ensure consideration is given to future investments and incentives within the unincorporated area that would result in expanded options for transit and active transportation, and to encourage shorter and fewer automobile trips, including locations of mobility hubs, transit leap, flexible fleets, and complete corridors.	SANDAG looks forward to coordinating with the County on many areas of implementation for the Regional Plan including the Flexible Fleet Implementation Strategic Plan, Active Transportation Plan, Comprehensive Multimodal Corridor Plans, and advanced transit planning. All of these efforts provide opportunities for refinement of the Regional Plan concepts at a local level.
L171	County staff would like to continue coordinating with SANDAG to further identify Regional Plan investments in infrastructure, technology, and communication improvements for roads identified in both the County's Mobility Element and unincorporated roads included in the RAS and how these investments will further connect the unincorporated area to proposed mobility hubs, flexible fleets, or transit leaps. In addition to providing efficient movement of people and goods, these investments would increase the efficiency of evacuation routes, relay important information on evacuation conditions to first responders, and assist in getting residents safely away from hazardous conditions, all important components of resiliency planning.	The 2021 Regional Plan puts in place a regional framework for a reimagined transportation system. The plans and studies identified as implementation actions of the Regional Plan will provide opportunities for SANDAG to work closely with the County on these suggestions for applying the 5 Big Move concepts to the unincorporated areas and improving mobility options and safety.
L172	County staff appreciates the difficulty in forecasting funding and revenue sources for a regional transportation network. The Regional Plan identifies use of TransNet funds as part of the implementation, but it is not clear whether projects that have previously been planned, programmed, or awarded as part of the previous plan using TransNet would retain that funding allocation, or if there would be a reallocation of these funds as part of the Regional Plan. It is also unclear if there would be any changes to the current allocation or use of funds that local agencies receive directly for local road system improvements. The unincorporated area relies on TransNet funding to build, improve, and maintain transportation facilities that enhance roadway safety and support smart growth development, including road infrastructure to support increased transit options. Loss or reallocation of this funding could affect these projects and limit the County's ability to provide transportation services in support of our goal of reducing greenhouse gas emissions	<p>A comparison between the <i>TransNet</i> Program of Projects and the Draft 2021 Regional Plan was included in the July 7, 2021 ITOC Agenda Item #2 (<a href="https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf">https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf</a>). In addition to the report narrative, you will find in Attachment 1 the details regarding the original <i>TransNet</i> projects and how those are addressed in the Regional Plan corridor by corridor.</p> <p>The 2021 Regional Plan maintains the current allocation of <i>TransNet</i> Local Street and Road funds for local jurisdictions.</p>
L173	<p>The Regional Plan indicates that user fees would help build a transportation system that provides travelers with alternatives to driving. County staff would like to further discuss how the proposed road user charges would be developed, implemented, and applied to ensure that this funding strategy will not disproportionately burden unincorporated communities, which often have longer commutes and less access to alternative transportation options due to lack of regional planning for transit services to these communities. Revenues generated should also be allocated to support additional transportation and mobility options in unincorporated communities, while vehicle use by those with access to alternate modes of transportation should be disincentivized since their communities are receiving significant investments in public transit.</p> <p>County staff looks forward to learning more about how future funding and investment would be applied to ensure that both the benefits and the costs of the Regional Plan are equitably distributed across the region.</p>	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.</p>
L174	The Regional Plan provides SANDAG with an opportunity to guide future investments in a way that meets smart growth objectives and reduces GHG emissions, but also guides future allocation of resources to achieve equitable outcomes. Several of the unincorporated communities, such as Lakeside, Spring Valley, and Ramona, have larger populations than some of the incorporated cities that are prioritized in the Regional Plan. In review of the proposed plan expenditures, a majority of the capital investments (55% of RTP funding) appear to go toward mobility hubs, complete corridors, and Next OS investments that	The Regional Plan considers the current and future needs of the whole region, including unincorporated communities. The reimagined transportation system offers benefits that extend through the region as residents and visitors travel outside their communities for work, recreation, school, entertainment, and accessing basic needs. The investments in Next OS, Flexible Fleets, Mobility Hubs, and programs are

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

	are primarily outside of unincorporated communities. It is unclear what proportion of investment would go toward addressing mobility challenges within unincorporated communities and infrastructure investment that would provide linkages between the unincorporated areas and the proposed mobility hubs, transit leap, flexible fleets, and complete corridors. County staff is committed to working with SANDAG to further identify opportunities to equitably distribute the mobility benefits of the 5 Big Moves and further reduce GHG emissions regionwide	presented as regional investments and SANDAG intends to work collaboratively with each jurisdiction to implement the Regional Plan and customize mobility solutions for the unique needs of each community.
<b>David Alvarez, on behalf of ReConnect Logan Community Leaders</b>		
L175	<p>On behalf of the residents and community leaders of Barrio Logan and Logan Heights, we submit these letters of support for the creation of a priority not currently identified in the 2021 Draft Regional Plan. It is imperative that you incorporate a project to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities.</p> <p>Specifically, we request the addition of a Freeway Lid as a priority project in SANDAG’s 2021 Draft Regional Plan (Draft Plan).</p> <p>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</p> <p>As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.</p> <p>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:</p> <p>The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)</p> <p>Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</p> <p>Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)</p> <p>Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.</p>	<p>Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</p>
<b>Douglas A. &amp; Christine L. Evans</b>		
L176	<p>We oppose “Road User Charges” as a funding source that would be incremental/ additional to the existing fuel fees and taxes for the transportation infrastructure as outlined in the 2021 Regional Plan Transportation. We request that you oppose implementation of such Road User Charges if they are in addition to the existing fuel fees and taxes. Road User Charges for all vehicles - Internal Combustion Engine (ICE),</p>	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

	<p>Electric Vehicles (EVs), Hydrogen, Hybrid, etc. -- is acceptable only if the State, County and City fuel fees (\$0.389/gallon) and taxes (California -- \$0.612/gallon) 1l are eliminated. If those fees and taxes are eliminated, then implementing a Road User Charge of \$0.27 /mile, which would generate the equivalent revenue as the current fuel fees and taxes would be reasonable (calculation assumptions -- average fleet fuel economy of 37.5 miles/gallon2l and miles driven per year of 12,5243)) . If the fuel fees and taxes are not eliminated, then Road User Charges should be implemented for ICE vehicles. Such charges could be added to the non-ICE vehicle's license fee - EVs, Hydrogen, Hybrid, etc.</p> <p>Use the fuel fees and taxes (federal and state of \$1.191)) as intended by the voters instead of diverting gas fee and tax revenues into other projects. From the Los Angeles Daily News4l, "The gross misspending, waste and diversion of gas tax revenues into projects having nothing to do with roads or highways. Caltrans admits that as it tries to focus available funding on core system assets, it is simultaneously increasing our investment in bicycle and pedestrian transportation. Gov. Newsom signed an executive order in 2019 that redirected gas tax money to fund railway systems and other non-road projects. Although SB 1 raised taxes with the promise that the money would be used to repair crumbling roads and bridges, about 30 percent of the revenue raised by the tax hike is designated for other transportation priorities, including public transit, bike lanes and walk paths." From the Fresco Bee5l, another disturbing example of diverting funds from their intended purpose, Gov. Gavin Newsom issued executive order N-19-19, which obligates the state transportation agency to leverage transportation spending on projects such as strategically directing discretionary transportation investments in support of housing production near available jobs and in accordance with the state 's smart growth principles. Stop diverting funds from their intended purpose.</p> <p>If projects for transportation in addition to roads and / or other non-transportation projects are needed, then put such projects on the ballot for a vote by the citizens of San Diego County I California to approve or reject a tax for such needs. Do not use the "bait and switch" tactic on the citizens of San Diego County. Use fees and taxes for their intended purpose - PERIOD!</p> <p>Thank you for your attention to this matter. We look forward to hearing your opposition to the Road User Charges as outlined in the SANDAG 2021 Regional Plan.</p>	<p>system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. Environmental Health Coalition

L177	<p>A. ZE drayage trucks are commercially available now and also comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.</p> <p>1. In section 4.1 (page Y-165), it states that "Port of SD: ZE vans and trucks may be suited to accommodate demand for goods movement in the area while reducing air quality and noise impacts, given the volume of local truck trips and improvements in ZE technologies....". Data indicates that these local trips, as well as much longer drayage trips, are already feasible today with ZE drayage trucks.</p> <p>2. Per the Port of San Diego study (November 2020)1, ZE drayage trucks with a range of over 100 miles are commercially available today. The Port study explains that:</p> <ul style="list-style-type: none"> <li>a. Five different ZE drayage trucks are expected to be commercially available by the end of 2020, while another seven should become available by 2022/2023. Each has a range of over 100 miles, which is enough to complete the average drayage truck duty cycle of less than 100 miles on a single charge;</li> <li>b. The range of existing electric Class 8 trucks cap out at around a 150-mile range on a single charge;</li> <li>c. ZE drayage trucks requiring more than 150 miles will be available soon; and,</li> <li>d. Truck ranges are expected to increase as manufacturers develop longer- range batteries with the Tesla semi planned to exceed 500 miles near the 2023 timeframe.</li> </ul> <p>3. ZE drayage trucks are comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.</p> <ul style="list-style-type: none"> <li>a. A Lawrence Berkeley National Laboratory (March 2021)2 study concludes that a Class 8 electric truck operated 300 miles per day when compared to a diesel truck offers a roughly 3-year payback and net present savings of about \$200,000 over a 15-year lifetime."</li> <li>b. The 2035 Report 2.0: Plummeting Costs and Dramatic Improvements In Batteries Can Accelerate Our Clean Transportation Future from UC Berkeley's Goldman School of Public Policy (April 2021)3 explains that the TCO for heavy duty electric vehicle starts out as positive compared to diesel and gets substantially better through 2035.</li> </ul>	<p>SANDAG will continue to support flexibility for funding and incentives to promote private and public sector adoption of zero-emission truck technologies. SANDAG will also share information on ZE commercial vehicle availability to private sector companies and industry organizations in the region through the Freight Stakeholders Working Group.</p> <p>SANDAG will be assessing existing medium-/heavy-duty ZE fleets and infrastructure, identifying barriers, and developing near and long term strategies for transitioning to these fleets through the recently awarded California Energy Commission Blueprints for Medium- and Heavy-Duty Zero-Emission Vehicle Infrastructure grant.</p>
L178	<p>B. ZE drayage trucks (not near-zero) trucks are needed to reach air quality and climate goals.</p>	<p>SANDAG's support of private sector education will assist operators in making appropriate choices as they determine the best way for their respective businesses to adapt to new policy and regulation and mitigate the</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>1. EJ communities and Climate Action Plans require ZE (not near zero) trucks. However, the SANDAG report encourages and/or assumes near zero. On page Y-29, it states “.....In addition to the international gateway forecast, develop a freight forecast to 2050 for three specific urban areas of the Gateway Region that addresses emerging freight trends, such as the transition to zero/near-zero-emission freight vehicles...”.</p> <p>2. The Luskin Report (2019)<sup>4</sup> specifically warns against meeting any short-term uptick in drayage truck turnover with natural gas trucks. The report explains that if investments focus on natural gas trucks as the primary replacement, more natural gas fueling stations will be needed. Given goals to transition to zero-emission trucks, these investments will inevitably be stranded or the ZE transition will be delayed unnecessarily.</p>	<p>effects of emissions on our climate. In addition, the “zero/near-zero emission” policies found within Appendix Y reflect statewide goals, strategies, and actions identified in the California Sustainable Freight Action Plan and California Freight Mobility Plan 2020.</p> <p>SANDAG acknowledges that more work needs to be done in this area and that various climate action plans developed for the region, along with federal and state agency initiatives, are being incorporated as SANDAG’s comprehensive strategies for addressing climate change in this and future regional plans.</p> <p>SANDAG continues to partner with the California Air Resources Board, the City of San Diego, the City of National City, the Port of San Diego, and other agencies to support the implementation of their specific climate action plans.</p>
L179	<p>C. Misclassification of truck drivers needs to be explained in report.</p> <p>1. Misclassification of truck drivers in California needs to be explained in the SANDAG report. On page Y-24, it states “...A large portion of truck operators in the freight industry are independent contractors who own their own vehicles and work for larger corporations. As policies start to implement regulations that discourage the continued use of heavy-duty diesel trucks and enforce the use of zero-emission vehicles, independent truck owners will be left with outdated vehicles they can no longer use, leading to potential unemployment for these operators...”.</p> <p>2. The drayage, package delivery, and other short-haul segments of the trucking industry are home to ongoing and egregious worker exploitation.<sup>5</sup></p> <p>3. Trucking companies, brokers, and other contracting entities often illegally misclassify drivers as independent contractors (when they are employees by law) to avoid paying wages, benefits, equipment costs, taxes, and regulatory compliance costs. <sup>6</sup></p> <p>4. Misclassified drivers operate 70 to 90% of California’s drayage trucks, making misclassification the drayage segment’s dominant business model. <sup>7</sup></p>	<p>Litigation is ongoing related to the trucking industry and California Assembly Bill 5 (AB 5). Appendix Y now contains the following updated passage:</p> <p>“In 2019, AB 5 was passed to regulate the use of independent contractors in a variety of activities that also included trucking. In January 2020, San Diego U.S. District Court Judge Roger Benitez issued a preliminary injunction blocking the enforcement of AB 5 against California trucking companies that contract with owner-operator truckers. The initial lawsuit was filed by the California Trucking Association (CTA) and two owner-operators seeking to prevent the application of AB 5 to the trucking industry. In late April 2021, in a ruling from a three-judge panel of the Ninth Circuit Court of Appeals, the panel reversed the granting of CTA’s preliminary injunction. Following the Ninth Circuit’s denial of CTA’s petition for rehearing in June, CTA filed a petition for a writ of certiorari with the United States Supreme Court on August 9, 2021. At this time, the deadline for the State of California’s response is October 12, 2021.”</p>
L180	<p>D. The Freight Gateway Study should address potential impacts of climate change on goods movement.</p> <p>1. The Gateway Study did not address potential impacts of climate change on 2050 freight projections. Impacts are difficult to predict, but it would be reasonable to develop scenarios that do not assume simple linear growth in freight volumes, due to disruptions in supply chains, extreme weather events, sea level rise, and potential changes in key industries in the San Diego region such as agriculture, construction, and tourism. As overarching policy directions, the San Diego region must plan for producing critically important goods closer to home, and reducing our dependence on goods movement as an economic driver.</p>	<p>The IHS Markit Transearch data used to develop the freight forecasts for the Freight Gateway Study Update include economic considerations resulting from climate change and other possible disruptions. Section 3.1 of the study has been revised to reflect this. SANDAG recognizes the importance of resilience through disruptions and will incorporate this into future goods movement planning efforts.</p>
L181	<p>E. Additional Comments on Goods Movement Planning and the Freight Gateway Study.</p> <p>1. Appendix Y correctly notes the importance of equity for workers in the freight industry, but mentions the potential impact of automation only in passing, on page Y-5. SANDAG needs to address the challenges of automation more fully. Who makes the decisions to automate unloading, loading, or movement of freight? What opportunities are there for workers and the public to participate in these decisions? What policies are in place, or needed, to support workers whose jobs may be at risk as a result of a shift to automation? Until these questions are answered fully, SANDAG’s goods movement planning will be failing these workers.</p> <p>2. Marine Highway M-5 is mentioned briefly on page Y-8 as a potential new source of trade. Short sea shipping may be a good option for reducing GHG and truck traffic. At the same time, Portside residents need to know how this mode shift would impact air quality in their communities. Will additional ships be coming to San Diego’s cargo terminals if the project is approved? Will these ships be shorepowered? Goods movement planning requires that local impacts be identified and addressed.</p> <p>3. Urban warehouses for e-bike deliveries are mentioned as an innovative delivery option on page Y-26. It is important to be clear that if trucks will also be accessing these facilities, they do not belong in residential areas. Residents of Barrio Logan and west National City have struggled for decades to eliminate incompatible land uses such as warehouses from their communities.</p> <p>4. Regarding infrastructure needs for truck freight hauling, the report, in Section 2.1.2.1. Gaps in Existing Road</p>	<p>SANDAG understands that this topic is evolving and will continue to work with stakeholders, monitor the adoption and readiness of technologies, and engage with the community as automation technologies mature. SANDAG will stay cognizant of policy decisions to avoid unintended consequences and influence outcomes.</p> <p>In January 2021, SANDAG provided a letter of support for an application submitted by the Port of San Diego and other west coast ports for the MARAD America’s Marine Highway – West Coast M-5 Coastal Connector. SANDAG will stay engaged with the Port of San Diego, assist as needed with policy decisions, communicate, and collaborate with stakeholders and community leaders to identify and monitor local impacts.</p> <p>SANDAG will collaborate with the City of San Diego and the City of National City in the configuration of truck routes in portside communities considering potential innovations like urban warehouses.</p> <p>SANDAG continues to support progress toward an adequate electric vehicle charging infrastructure for both freight and passenger vehicles in collaboration with public agency and private industry stakeholders. This support includes planning through the Comprehensive Multimodal Corridor Plans (CMCPs) that include federally designated zero-emission vehicle corridors and commensurate charging infrastructure as well as the development of a Blueprint for Medium-/Heavy-Duty (MD/HD) ZEV Infrastructure. A SANDAG board resolution was passed to work collaboratively to establish the framework and agreement for a joint electric vehicle charging incentive program with the California Energy Commission, County Air Pollution Control District, and</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Infrastructure, correctly notes the lack of dedicated truck parking, staging, and queuing facilities. Another essential piece of freight infrastructure planning: EV charging facilities for MD/HD trucks. Charging facilities must be planned and installed in readiness for the transition to ZEV trucks that is mandated in California.</p> <p>5. Regarding outbound cargo, Figure 3.14 on page Y-129: Gravel is the largest outbound cargo, by tonnage, at 3,505 tons. This is a category of commodity that also includes aggregate. Sand is also a large outbound commodity, at 1,086 tons. It appears unnecessary to develop new imports of sand, gravel, and aggregate into the region, and unlikely to produce reductions of emissions from trucks.</p>	<p>Center for Sustainable Energy as part of the Regional Vehicle Charging Program partnership program. SANDAG will continue to coordinate with Caltrans in their efforts to plan the deployment of potential medium- and heavy-duty truck charging infrastructure in conjunction with parking identified through the California State Truck Parking Study that is currently underway.</p> <p>SANDAG builds public transportation and active transportation projects and thus has an interest in the status of aggregate commodities that are available in the region. SANDAG, however, does not control regional private sector markets and will be subject to the same economically-driven market dynamics as other aggregate consumers. SANDAG continues to support maritime and highway vehicle conversion to zero emission power to further reductions in air pollutants and GHGs from these industries.</p>
<b>Friends of Rose Canyon 1</b>		
L182	<p>Our overall comment is that the 2021 Draft Regional Plan states that it proposes a bold new vision. However, it is based on a massive expansion of our highways. This includes widening many of our highways to add Managed Lanes and adding huge, elevated concrete “Managed Lane Connectors” (MLCs) where highways intersect. These MLCs will require even further highway widening to add lanes where traffic would enter and exit the connectors. In some cases these MLCs connect highways at very different elevations or with multiple other on and off ramps and bridges in the same location. Judging from just the area we focus on, these added MLs and MLCs will have huge direct and indirect environmental impacts on sensitive habitat, MSCP lands, Marian Bear Park, Rose Canyon Open Space Park, MCAS Miramar, and the Rose Creek and Carroll Canyon Creek/Sorrento Valley/Penasquitos Lagoon watersheds. Furthermore, just in the area we focus on, these MLs and MLCs will cost many hundreds of millions of dollars.</p>	<p>The 2021 Regional Plan places emphasis on maximizing the use of existing facilities to add corridor capacity to ease congestion while also trying to achieve meeting state and federal greenhouse gas and air quality targets. The proposed managed lanes network uses existing infrastructure by repurposing shoulders and general purpose lanes to offer priority access to transit, carpools, vanpools and low-emission vehicles with appropriate decals. The system of managed lanes and supporting connectors support Transit Leap and high occupancy vehicles to create a seamless systemwide network that will provide people with transportation options, reducing the need to add new highways or general purpose lanes.</p> <p>Decisions on where to construct proposed managed lanes connectors including defining and designing site specific elevation profiles and or structural/physical footprint construction components will be examined through more detailed operational and technical studies. These efforts are generally undertaken during the project development and environmental clearance phase which is generally carried out with public input and following the California Environmental Quality Act guidelines to evaluate proposed project impacts and identify necessary mitigation measures.</p>
L183	<p>How sure is SANDAG of those calculations? What is the course correction if we start adding all this highway capacity and the benefits are not there? Do the RTP models rest on the assumption that the projected benefits require that all the highway MLs and all the MLCs be added to achieve the projected benefits? What if we get half way into building this out and find that adding all this highway capacity is not bringing the benefits anticipated?</p>	<p>SANDAG is required to analyze induced demand impacts of the Regional Plan, which are documented in Appendix D. The activity-based model and other analyses used to inform the plan have been reviewed through SANDAG’s peer review process and documented in the technical methodology submitted to the California Air Resources Board, also included in Appendix D. Where possible, the Regional Plan proposes repurposing of general purpose lanes or shoulders to create managed lanes. The managed lane system is important for supporting the transit network and Flexible Fleets envisioned in the Regional Plan. The Regional Plan is updated every four years, providing opportunities to reflect changes in the network</p>
L184	<p>Based on what we see proposed for just the area we focus on, we see major direct and Indirect Impacts on MSCP lands, open space, habitat, native plant and animal species, wildlife corridors, creeks, and watersheds. Adding Managed Lanes and Managed Lane Connectors means bulldozing land and building extensive new concrete surfaces and retaining walls and drainage ditches, expanding direct impacts and edge effects on habitat and wildlife, increasing storm water run-off, noise and light impacts, invasive species, habitat loss, loss of wildlife connectivity and wildlife corridors, increased erosion, trash, and air and water pollution. “Mitigating” these impacts through projects done in distant mitigation banks does nothing to reduce the impacts in the areas where these impacts occur.</p> <p>While SANDAG staff have stated in meetings with the QOL coalition that they are not widening outside the highway ROWs, that does not mean there won’t be major highway widening and environmental impacts. In some cases, CALTRANS has sufficient ROW to widen by multiple lanes. And widening even within the ROW extends the damaging impacts and pushes the edge effects closer to and into sensitive habitat.</p>	<p>For direct and indirect impacts related to biological resources in the area within and extending out from the I-805/SR 52/I-5 triangle, that includes the Rose Creek watershed (Rose Canyon, MCAS Miramar, San Clemente Canyon and Marian Bear Park, and Rose Creek extending south to Mission Bay), and the Carrol Canyon, Sorrento Valley, and Penasquitos Lagoon watersheds please refer to Section 4.4 Biological Resources of the EIR.</p> <p>Measures have been identified in the EIR to implement design, minimization and avoidance measures for sensitive vegetation communities that provide habitat for special-status species during construction and operational maintenance.</p>
L185	<p>Meanwhile, the Purple Line (Commuter Rail 582) from Sorrento Mesa to the Border (a true transit project) will not be completed until 2050. In concept, we strongly support this project, assuming it is largely underground through the environmentally sensitive areas we focus on. But despite the importance of this transit project, we know little beyond the vaguest description of its route. Where might it be underground? Where might it be at grade or above grade? Why is it not being completed until 2050 while the RTP prioritizes adding so many highway MLs and MLCs?</p>	<p>The Purple Line is broken down into two phases of the 2021 Regional Plan. The first phase is planned for by 2035 and will operate between National City and Sorrento Valley. It is conceptually planned right now to be fully grade separated and operate either in tunnels or on aerial structures. At the Regional Plan level, we have not determined the exact location of the tunnels or structures. By 2050, the Purple Line would be extended between National City and the San Ysidro Border. Next Generation Rapid routes are planned along the Managed Lanes on Interstate 805 in the early years of the plan in order to build ridership while the Purple Line is being designed and constructed.</p>
L186	<p>On April 15, 2021, the Sierra Club sent the attached letter to SANDAG Director Hasan Ikhata, Director of Regional Planning Coleen Clementson, Senior Transportation Planner Jennifer Williamson, and several SANDAG BOD members. At a subsequent meeting with the Quality of Life Coalition’s Transportation Committee, Coleen Clementson stated</p>	<p>The 2021 Regional Plan includes no additional freeway widening along Interstate 805 between SR-52 and Sorrento Valley Road. The Direct Access Ramp at I-805 has been removed from the 2021 Regional Plan. There are no park and rides or Rapid stations planned for the Southwest Corner of Nobel/I-805. A bus route would</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>vehemently, “We agree with you.” We therefore assume and would like confirmation, that the following is not in and will not be added to the RTP for the I-805 North from just south of SR-52 to Carroll Canyon Road:                      -Any additional freeway widening beyond what has currently been built (one Carpool/ HOV lane in each direction was completed in 2016)                      -Widening of the I-805 bridge over Rose Canyon                      -Direct Access Ramps (DARs) at Nobel Drive                      -A Park &amp; Ride at the southwest corner of Nobel/I-805                      -A bus station at the southwest corner of Nobel/I-805</p>	<p>still access Nobel Drive through operational improvements, but the location of any stops could occur on street or on the north side of Nobel Drive.</p>
L187	<p>Project ID CC114 is called I-805 (Nobel Drive) - it should be deleted from the RTP                      Rationale: I-805 North should locate access to and from the Managed Lanes at La Jolla Village Drive, not Nobel Drive. La Jolla Village Drive has extensive high density employment and high density housing located between the LJVD/I-805 intersection and Genesee Avenue. At Genesee there are two trolley stations surrounded by existing and planned high density employment and housing. La Jolla Village Drive is the route BRT lines should use to enter and exit the I-805 MLs. Nobel Drive is a poor location for a BRT route to enter or exit I-805 MLs. The location is far from significant employment or housing density. Furthermore, no parking lot or bus station should be located at Nobel/805. The I-805 commute is south to north in the morning, so parking lots near the I-805 should be located in communities well to the south where commuters come from in the morning. The land at the Nobel/ I-805 intersection should be protected from any further impacts. Most of it is MSCP, and there are vernal pools and numerous documented sensitive species. That area should have no further disturbance.</p>	<p>The Direct Access Ramp at Nobel/I-805 has been removed from the 2021 Regional Plan. There are a number of constraints that limit the ability of the Rapid bus to access La Jolla Village Drive via the Managed Lanes. The current plan is to use existing ramps or operational improvements that would give the bus some level of priority to enter the existing ramps. More planning will need to occur as this project moves forward.</p>
L188	<p>The RTP should reduce the amount of highway expansion and the number of MLCs in this area. SR-52 should not be widened and the MLCs between these highways should be eliminated.</p> <p>The following projects would cause major environmental damage to MSCP lands and to the area’s critical and already highly constrained wildlife corridors.                      This area illustrates our concern about the RTP as a whole. The RTP proposes a massive expansion of highway capacity in the name of creating “Complete Corridors” that will, in theory, carry BRT lines and carpools. While it is true that some existing general purpose lanes will be converted to “Managed Lanes”, the RTP proposes an expansion of all the highways in this area to add MLs plus multiple MLCs between these highways that will further degrade the habitat and wildlife corridors.</p> <p>CC085: 2035 - MLC I-805 (SR 52) West to North and South to East CCT - \$149 mil                      This MLC will cause major environmental damage to an area with important wildlife corridors that connect MCAS Miramar, San Clemente Canyon (and Marian Bear Park) and Rose Canyon. These wildlife corridors are identified in the MSCP and in the MCAS Miramar Natural Resource Management Plans. The wildlife corridor between MCAS Miramar and San Clemente Canyon is already highly constrained at the I-805/52 intersection. In addition, the elevation change between the I-805 and SR-52 is significant. A further environmental impact will occur due to adding two MLs to SR-52 east of I-805 and one ML to SR-52 west of I-805.</p> <p>CC086: MLC I-805 (SR52) North to West and East to South (\$126 mil): More environmental impacts in this same area.</p> <p>CC003 - (by 2035) - I-5 (Pacific Highway to SR 52) 8F to 6F+4 ML (\$353 mil) (adding 1 lane in each direction to I-5)</p> <p>CC004 by 2035 I-5 (SR 52 to I-805) 8F to 6F + 4ML (adding one lane in each direction) (\$190 mil) CC028 by 2050 MLC I-5 (SR 52) South to East and West to North (\$202 mil)                      CC065 by 2050 Complete Corridor: ML SR 52 (I-5 - I-805) 4F to 4F + 3 ML (\$214 mil)                      This massive widening of SR 52, with additional width needed to build the Managed Lane Connectors between I-5/52 and SR 52/ I-805 (MLCs in all directions) will have huge negative impacts on the adjacent MSCP lands in San Clemente Canyon and Marian Bear Park and on Rose Canyon and on the wildlife corridors between</p> <p>CC066 by 2050 I-5 (SR 52) MLC - North to East and West to South (\$202 mil)</p>	<p>For direct and indirect impacts related to biological resources please refer to Section 4.4 Biological Resources of the EIR. Measures have been identified in the EIR to implement design, minimization and avoidance measures for sensitive vegetation communities that provide habitat for special-status species during construction and operational maintenance.</p>
<b>Friends of Rose Canyon 2</b>		
L189	<p>The City of San Diego’s chosen alignment for the Coastal Rail chosen between Gilman/La Jolla Colony Drive and Sorrento Valley Coaster Station should be added to the RTP and the old alignment should be deleted (Rose Canyon, “UTC” (along Judicial Drive), Roselle Canyon and Roselle St to the Sorrento Valley Coaster station). This old alignment was thoroughly studied and rejected due to multiple major problems.</p>	<p>SANDAG has worked with project partners at Caltrans to include the North Coast Bike Trail projects in the 2021 Regional Plan as part of the Adopted Regional Bike Network, this includes the completed segments referenced here.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>The Draft RTP contains inconsistent and out-of-date labeling of a portion of the City of San Diego’s Coastal Rail Trail. The City is the Lead Agency for the Coastal Rail Trail in the City, and it has selected the alignment and completed final design of the alignment along Gilman Drive to UCSD.</p> <p>The City has deleted from its Bike Master Plan the old Rose Canyon, “UTC”, and Roselle Canyon alignment. The City studied that route for years and rejected it for multiple reasons. The RTP therefore needs to:</p> <ul style="list-style-type: none"> <li>• cut three planned CRT segments and trim one CRT segment</li> <li>• relabel the CRT route in the RTP to coincide with the approved Gilman Drive CRT segment, adding the UC San Diego CRT segment plus the I-5 Bicycle Corridor.</li> <li>• Amend Appendix A and Appendix L in the SANDAG RTP to be consistent with this change.</li> </ul> <p>The RTP should make the following changes summarized in the following tables (see attached letter for full tables presented by commentor):</p> <p>CRT route as presented in the SANDAG RTP:</p> <ol style="list-style-type: none"> <li>1. AT032 (CRT - Carmel Valley to Sorrento to Roselle Canyon) - Change Carmel Valley to Roselle via Sorrento by removing Sorrento to Roselle. Carmel Valley to Sorrento Remains</li> <li>2. AT036 (CRT - Roselle Canyon) - Cut</li> <li>3. AT037 (CRT - UTC to Rose Canyon) - Cut</li> <li>4. AT023 (CRT - Rose Canyon) - Cut</li> </ol> <p>The RTP needs to add the CRT route the City of San Diego has chosen for the segment from Sorrento Valley Coaster Station to the Gilman Drive/La Jolla Colony intersection</p> <ol style="list-style-type: none"> <li>1. CRT – I-5 Bicycle Corridor (Sorrento Valley to Voigt and Gilman): Already completed by Caltrans</li> <li>2. CRT - UC San Diego (Voigt/Gilman Dr. to Gilman/La Jolla Village Dr.): UC San Diego is adding major bike infrastructure improvements through the campus on this route</li> <li>3. CRT - Gilman (Gilman Dr./La Jolla Village Dr. to Gilman Dr. and I-5/Rose Creek Bike Path and La Jolla Colony Dr.): Protected bike lanes fully designed by City. Partial construction funding in SD City 2022 CIP budget.</li> </ol>	<p>Portions of the City of San Diego’s 1.63 mile Coastal Rail Trail project S00951 are already identified as the Gilman Connector in the project list in Appendix A. This will be a connector to SANDAG’s recently upgraded Rose Canyon Bike Path and newly constructed Rose Creek Bikeways to the south. Extending north, however, there remains a need for safe, direct, all ages and abilities active transportation alternatives extending into currently underserved residential (University) and employment centers (UTC, Sorrento Valley) to improve alternatives in this major transportation corridor. In order for SANDAG to stimulate the shift from personal motor vehicle use to people choosing to bike, a network of well-designed routes is essential. The City of San Diego’s project on Gilman Drive is greater than 2 miles away from, and represents just 25% of, the entire length of the projects requested to be removed.</p> <p>These projects and this alignment were first identified in the 2000 Coastal Rail Trail Project Study Report: <a href="https://www.keepsandiegomoving.com/Libraries/Transnet-doc/Coastal_Rail_Trail_Project_Study_Report_reduced.sflb.ashx">https://www.keepsandiegomoving.com/Libraries/Transnet-doc/Coastal_Rail_Trail_Project_Study_Report_reduced.sflb.ashx</a>.</p> <p>These projects were approved by the SANDAG Board of Directors In 2010 with the development of a comprehensive regional bike network - Riding to 2050: The San Diego Regional Bike Plan: <a href="https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?projectid=353&amp;fuseaction=projects.detail</a>.</p> <p>Again, these Coastal Rail Trail segments were identified as a priority project in 2013 via the Bike Early Action Program (EAP): <a href="https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=34&amp;subclassid=122&amp;projectid=497&amp;fuseaction=projects.detail</a>.</p> <p>SANDAG plans to deliver all bikeway projects proposed in the 2021 Regional Plan, and looks forward to partnering with Friends of Rose Canyon and the City of San Diego to ensure the success of these projects.</p>
L190	<p>The savings for the three old, out-of-date segments to be cut is \$53 million (Rose Canyon, UTC (Judicial Drive) and Roselle Canyon, plus any savings from trimming the route AT032 by cutting Sorrento to Roselle, a segment made unnecessary by the I-5 bike path from the Sorrento Valley Coaster Station to UCSD. Two of the three segments in the City’s chosen CRT route are either complete or funded, so it can be anticipated that almost all of the \$53 million in the RTP can be freed up for active transportation projects that address equity, for example, in Chollas Creek, South Bay, or the Midway Corridor.</p>	<p>The Chollas Creek Bikeways: North Fork - Bayshore Bikeway to University Bikeway and South Fork - Petway Park to Market Creek Plaza has been incorporated into the 2021 Regional Plan and will help facilitate all ages and abilities active transportation connections in another watershed and transportation corridor like Rose Canyon. Please see the South Bay to Sorrento, and Central Mobility Hub tables in Appendix A (and online data viewer) for specific bikeway alignments and project details for these other two corridor areas.</p>
L191	<p>The CRT route has City and Community support:</p> <ul style="list-style-type: none"> <li>• The SANDAG RTP routes do not exist in the City of San Diego Bike Master Plan. They were explicitly deleted by the San Diego City Council in December 2013.</li> <li>• The approved CRT Project route in San Diego has been selected, with the final Gilman Dr. link ready for construction and on the CIP list for 2020-2021.</li> <li>• The approved CRT route was developed and selected by a City of San Diego Public Working Group in 2013-2014.</li> <li>• The approved CRT route is supported by the Community Planning Groups: the UCPG in 2013 and 2021, and the La Jolla Planning Association in 2021.</li> <li>• The approved CRT route has been supported by the City of San Diego in 2013, 2016 and budgeted in 2021.</li> </ul> <p>The City’s approved CRT route enhances important existing connections:</p> <ul style="list-style-type: none"> <li>• With the Rose Creek bikeway open, it is a connecting link to UC San Diego from the south.</li> <li>• With the existing I-5 Bicycle Corridor, it is a connecting link to UC San Diego from Sorrento and the Coaster.</li> <li>• The completed UC San Diego Gilman Bridge over I-5 provides comfortable and safe bicycle links to the east UC San Diego Campus, industry along Eastgate Mail, and the commercial center at UTC.</li> </ul>	<p>SANDAG agrees that the infrastructure improvements listed here are all critically needed.</p>
<b>Gatzke Dillon &amp; Ballance LLP 1</b>		
L192	<p>This firm represents Lakeview 1, LLC, Lakeview 2, LLC and Moller Lakes Investment, LLC (collectively, Lakeview), owners of the approved Otay Ranch Resort Village Project (Resort Village).<sup>1</sup> On behalf of Lakeview, we have reviewed SANDAG’s Draft 2021 Regional Plan (Draft Plan) and provide the comments that follow below.</p>	<p>Government Code section 65080(b)(2)(B) provides that a Sustainable Communities Strategy (SCS) “use most recent planning assumptions considering local general plans and other factors.” It also requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>As relevant background, the Resort Village is part of the Otay Ranch General Development Plan/ Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in November 2020, approved the Resort Village for 1,938 residential units, a resort, and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which the Resort Village is a part—has been accounted for in regional plans and projections since 1993.</p> <p>As discussed below, it appears that SANDAG’s Draft Plan has omitted from its design assumptions the Resort Village and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of the Resort Village as a fully-entitled project.</p> <p>We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a “forecasted development pattern” that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), and (iii) utilize the “most recent planning assumptions.” (Draft Plan, p. 19). SANDAG reports that its SCS will exceed CARB’s 2035 reduction target for the region by one percent; i.e., a 19 percent reduction is required and the SCS, if implemented, will realize a 20 percent reduction.</p> <p>We provide the following comments on the Draft Plan, including its SCS:</p> <p>1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions considering local general plans and other factors” (italics added). In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to ensure SANDAG’s compliance with this statutory requirement for its SCS. Specifically, the referenced figures show approved and entitled development located within Otay Ranch—including the Resort Village—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect. The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Resort Village in 2020. As such, it results in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-approved by the County and long-recognized by its General Plan for this portion of unincorporated South County.</p>	<p>automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan. The Regional Plan forecasts development through 2050 consistent with projections from the California Department of Finance but does not represent buildout of jurisdictions’ General Plans. The Otay Ranch Resort Village Project had not been approved by the Board of Supervisors at the time the SCS Land Use Pattern was developed, and it was not projected for future development in the SCS. The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.</p>
L193	<p>2. The Draft Plan’s forecasted development pattern will not accommodate the RHNA. Specifically, the Draft Plan—in Table F.3 of Appendix F—projects the construction of just 7,419 dwelling units in unincorporated County areas over the next roughly 30 years (through 2050). This number does not accurately represent the amount of approved, planned and reasonably anticipated growth in the unincorporated areas. For example, in the 6th RHNA Cycle, which covers the 2021 through 2029 planning period (and thus does not align with the 2035 horizon year of the SCS modeling), SANDAG assigned 6,700 dwelling units to the unincorporated areas.<sup>2</sup> Therefore, it appears the Draft Plan assumes that a mere 719 additional units will need to be built in unincorporated areas between 2030 and 2050, an assumption that is at odds with reasonable approximations of future RHNA cycles and existing market supply-and-demand evaluations for the San Diego region. The Draft Plan’s assumption of 7,419 units also is approximately 1/8th of the County’s General Plan build-out capacity of approximately 65,000 dwelling units. Thus, we respectfully request that SANDAG reevaluate the reasonableness of its forecasted development pattern by way of housing growth assumptions. It is critical to ensure that all modeling inputs are informed and reasoned, such that the SCS quantification analysis is defensible.</p>	<p>The 2021 Regional Plan accommodates the regional housing need determined by the Department of Housing and Community Development for the 6th Cycle RHNA. Government Code section 65080(b)(2)(B) requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan. The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.</p>
L194	<p>3. It is unclear to what extent the SCS and its supporting quantification framework account for the home-to-work, interregional commute reality present in San Diego. We know that the San Diego region’s failure to provide sufficient in-County housing opportunities has resulted in the exportation of some San Diego workers who now must commute into the region from more affordable housing opportunities in Riverside County or Mexico.<sup>3</sup> The spirit of Senate Bill (SB) 375, which created the statutory framework for SANDAG’s SCS, will not be met unless and until we grapple with how land use choices made in the San Diego region affect San Diego workers. The Draft Plan must clarify SANDAG’s strategies for reducing interregional commuting. Such strategies must ensure a sufficient quantity of in-County housing opportunities exists; otherwise, home-to-work, interregional commuting will continue to be a major problem.</p>	<p>As described in Appendix F, the Regional Growth Forecast has accounted for the need to increase the quantity of in-County housing opportunities. Appendix F includes the following language: “First, the forecast assumes the region’s vacancy rate would increase to 4% by 2040. The 4% vacancy rate assumption acknowledges that the region’s vacancy rate in 2018 was estimated to be less than 2% and that both state and local housing policy has recently focused on accelerating housing production. Second, the forecast assumes that the Series 14 Regional Growth Forecast accounts for vacation rentals and second homes, which are “unoccupiable,” meaning that they are not available for year-round residence. The result of this assumption is that more housing units would need to be developed to counteract the housing units no longer available to residents for long-term occupancy. Third, data for all the counties in the U.S. show that as the population ages, household size declines, and the Series 14 Regional Growth Forecast assumes that due to the aging</p>

<p style="text-align: center;"><b>Gatzke Dillon &amp; Ballance LLP 2</b></p>		
<p>L195</p>	<p>As relevant background, Village 14 and Planning Areas 16 and 19 are part of the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in June 2019, approved the Specific Plan and Tentative Map for the Adara community for up to 1,119 residential units and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which Village 14 and Planning Areas 16 and 19 is a part—has been accounted for in regional plans and projections since 1993.</p> <p>As discussed below, however, it appears that SANDAG’s Draft Plan has omitted from its design assumptions the Adara community and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of Adara as a fully-entitled project located within Otay Ranch.</p> <p>We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a “forecasted development pattern” that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), and (iii) utilize the “most recent planning assumptions.” (Draft Plan, p. 19). SANDAG reports that its SCS will exceed CARB’s 2035 reduction target for the region by one percent; i.e., a 19 percent reduction is required and the SCS, if implemented, will realize a 20 percent reduction.</p> <p>We provide the following comments on the Draft Plan, including its SCS:</p> <p>1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions considering local general plans and other factors” (italics added). In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to ensure SANDAG’s compliance with this statutory requirement for its SCS. Specifically, the referenced figures show approved and entitled development located within Otay Ranch—including Village 14 and Planning Areas 16 and 19—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect.<sup>1</sup> The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Adara Specific Plan and Tentative Map in 2019. As such, it results in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-approved by the County and long- recognized by its General Plan for this portion of unincorporated South County.</p>	<p>population in the region, a similar pattern will be observed. This is achieved by converging to household formation rates from the 2010 decennial census by 2035, which are held at that level through the end of the forecast.”</p> <p>The 2021 Regional Plan includes investments in a housing program to coordinate with local jurisdictions, developers, and other stakeholders to accelerate affordable housing production near jobs and transit.</p> <p>Government Code section 65080(b)(2)(B) provides that a Sustainable Communities Strategy (SCS) “use most recent planning assumptions considering local general plans and other factors.” It also requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan. The Regional Plan forecasts development through 2050 consistent with projections from the California Department of Finance but does not represent buildout of jurisdictions’ General Plans. The Otay Ranch Village 14 and Planning Areas 16 and 19 had not been approved by the Board of Supervisors at the time the SCS Land Use Pattern was developed, and it was not projected for future development in the SCS. The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.</p>
<p>L196</p>	<p>2. The Draft Plan’s forecasted development pattern will not accommodate the RHNA. Specifically, the Draft Plan—in Table F.3 of Appendix F—projects the construction of just 7,419 dwelling units in unincorporated County areas over the next roughly 30 years (through 2050). This number does not accurately represent the amount of approved, planned and reasonably anticipated growth in the unincorporated areas. For example, in the 6th RHNA Cycle, which covers the 2021 through 2029 planning period (and thus does not align with the 2035 horizon year of the SCS modeling), SANDAG assigned 6,700 dwelling units to the unincorporated areas.<sup>2</sup> Therefore, it appears the Draft Plan assumes that a mere 719 additional units will need to be built in unincorporated areas between 2030 and 2050, an assumption that is at odds with reasonable approximations of future RHNA cycles and existing market supply-and-demand evaluations for the San Diego region. The Draft Plan’s assumption of 7,419 units also is approximately 1/8th of the County’s General Plan build-out capacity of approximately 65,000 dwelling units. Thus, we respectfully request that SANDAG reevaluate the reasonableness of its forecasted development pattern</p>	<p>The 2021 Regional Plan accommodates the regional housing need determined by the Department of Housing and Community Development for the 6th Cycle RHNA. Government Code section 65080(b)(2)(B) requires that the SCS “set forth a forecasted development pattern for the region, which, when integrated with the transportation network and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board.” The SCS included in the 2021 Regional Plan projects development that would achieve the state-mandated GHG emissions reduction target when integrated with the transportation investments, programs and policies in the Plan.</p> <p>The Regional Plan and its SCS are iterative planning documents that are typically updated every four years to account for new data, analysis, policy, and experience.</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

L197	<p>by way of housing growth assumptions. It is critical to ensure that all modeling inputs are informed and reasoned, such that the SCS quantification analysis is defensible.</p> <p>3. It is unclear to what extent the SCS and its supporting quantification framework account for the home-to-work, interregional commute reality present in San Diego. We know that the San Diego region's failure to provide sufficient in-County housing opportunities has resulted in the exportation of some San Diego workers who now must commute into the region from more affordable housing opportunities in Riverside County or Mexico.<sup>3</sup> The spirit of Senate Bill (SB) 375, which created the statutory framework for SANDAG's SCS, will not be met unless and until we grapple with how land use choices made in the San Diego region affect San Diego workers. The Draft Plan must clarify SANDAG's strategies for reducing interregional commuting. Such strategies must ensure a sufficient quantity of in-County housing opportunities exists; otherwise, home-to-work, interregional commuting will continue to be a major problem.</p>	<p>As described in Appendix F, the Regional Growth Forecast has accounted for the need to increase the quantity of in-County housing opportunities. Appendix F includes the following language: "First, the forecast assumes the region's vacancy rate would increase to 4% by 2040. The 4% vacancy rate assumption acknowledges that the region's vacancy rate in 2018 was estimated to be less than 2% and that both state and local housing policy has recently focused on accelerating housing production. Second, the forecast assumes that the Series 14 Regional Growth Forecast accounts for vacation rentals and second homes, which are "unoccupiable," meaning that they are not available for year-round residence. The result of this assumption is that more housing units would need to be developed to counteract the housing units no longer available to residents for long-term occupancy. Third, data for all the counties in the U.S. show that as the population ages, household size declines, and the Series 14 Regional Growth Forecast assumes that due to the aging population in the region, a similar pattern will be observed. This is achieved by converging to household formation rates from the 2010 decennial census by 2035, which are held at that level through the end of the forecast."</p> <p>The 2021 Regional Plan includes investments in a housing program to coordinate with local jurisdictions, developers, and other stakeholders to accelerate affordable housing production near jobs and transit.</p>

Good Neighbor Project San Diego

L198	<p>My family has lived in Barrio Logan/Logan Heights for over 100 years I'm a retired school teacher and founder and Exec Dir of the Good Neighbor Project SD my home and office is located at 2215 Logan Ave. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego's Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan (Draft Plan)</p> <p>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know Re-Connect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</p> <p>As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.</p> <p>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, it is appropriate to identify and call out Re- Connect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:</p> <p>The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)</p> <p>Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</p> <p>Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)</p> <p>Besides being in line with the 2021 Draft Regional Plan, Re-Connect Logan Freeway Lid is also pursuant to Appendix H in</p>	<p>Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</p>

	<p>relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.</p>	
<p><b>Harvey Levine</b></p>		
<p>L199</p>	<p>I need to preface my comments by expressing my admiration for the product that SANDAG has produced and for the investment that has been made in developing a potentially ideal transit-based solution to the environmental and density challenges with which we are faced in this remarkable county. The professionalism and quality exhibited in the published works are of the highest rank and served me well in my quest to understand the goals of the RTP and the methods to achieve them. It is indeed a visionary expression of a world-class system for a future population. I recognize the seriousness of the challenges and I fear for the future of the planet. I applaud the bold and creative efforts to meet these challenges head on, to work to meet state and federal mandates, and to qualify for state and federal funding and subsidies where available.</p>	<p>Thank you for reviewing the draft Regional Plan and for your compliments on this report.</p>
<p>L200</p>	<p>In my consulting practice I have often been engaged to perform due diligence on business cases for major programs and for proposals for new business initiatives. As I became deeply interested in the 2021 RTP, I couldn’t help seeing items that sounded alarms and triggered reality checks. As I have seen all too often, the search for the ideal has surpassed the practicalities of what is reasonable and achievable. I also am concerned that the sponsors may have based their assumptions on a best case or “wished for” values rather than a most likely set of scenarios. This plan begs for a responsible investigation and evaluation of the RTP by members of the SANDAG board who will carry the responsibility for this investment in the future. There is actually more at risk than an investment. The county appears to be committed to facilitate and mandate a radical change in the culture and behavior of a vast populace whose lifelong belief is that having a personal vehicle to go anywhere, at any time, is an inalienable right. The board is not voting for a transportation plan. It is voting to mandate a change to the very foundation of our lifestyle. They better get it right. We need to do something that will work.</p>	<p>Starting in 2019, the Board discussed the development of the Regional Vision for the draft 2021 Regional Plan. The Board will be asked to take action to adopt the proposed final 2021 Regional Plan in December 2021.</p> <p>For more information regarding the Board of Directors meeting, and staff reports pertaining the Regional Plan, please visit: <a href="https://sdforward.com/about-san-diego-forward/staff-reports">https://sdforward.com/about-san-diego-forward/staff-reports</a>.</p> <p>Please note that both federal and state transportation planning law require RTPs to be revenue-constrained and capable of implementation, and the 2021 Regional Plan has been prepared consistent with these requirements.</p> <p>Appendix M of the 2021 Regional Plan describes the progress SANDAG has made on actions from the 2015 Regional Plan and 2019 Federal Regional Transportation Plan.</p>
<p>L201</p>	<p>Actually, there are two huge hurdles. One is the nature of people to resist paradigm shifts. Cultures cannot be mandated. They exist by will of the people. The 2021 Regional Plan makes assumptions of colossal culture change that cannot be reasonably presumed. This is a fact of life that governs what can be accomplished, no matter how “good” it is for the people and for the planet. For example we need only look to our current COVID-19 crisis. The only way out of the pandemic is via vaccination. The science is certain. The data is monumentally supportive. Yet, a major portion of the population refuses to do what is good for them and for the nation. Has this artifact of human nature been given adequate consideration in the plan?</p> <p>The second hurdle, which has led to the demise of even the most seemingly foolproof plans, is the failure to consider the potential downside of the business case. In every plan there is a range of possible outcomes. We can look at the case through three lenses; the optimistic, the most likely, and the pessimistic. Where things fall apart is when exuberant support for the “optimistic” case causes the sponsor to downplay the “most likely” and to ignore the “pessimistic, and the associated risks.”</p> <p>The pessimistic case fully considers risks. It creates alternate models representing the potential downside. The downside can happen. Even the most infallible plans have collapsed, leading to total failure of the venture, because of the reluctance to use assumptions that consider potential events and conditions that are not of the sponsor’s liking.</p> <p>Here in San Diego, even in SANDAG, we have a history of inflated assumptions. We have seen it in the forecast of pension funding and in the projection of tax revenues. We have also seen it in the estimates of transit ridership. What assurances can you give the public that the 2021 Regional Plan is not based on inflated assumptions of income, ridership, or even the level of acceptance of change by the public?</p> <p>Where are the models that represent a lesser level of expectations and what that would mean to accomplishment of the goals? I see a presentation of the ideal. Where is the picture of the realistic?</p>	<p>The 2021 Regional Plan addresses transportation and mobility challenges we face: safety and traffic congestion, social inequities, and complies with state and federal requirements to reduce greenhouse gas (GHG) emissions and air pollution, among other requirements. A compliant Regional Plan is needed for the San Diego region to receive federal and state funding for transportation projects, programs, and services and housing programs.</p> <p>Appendix S documents the transportation demand modeling tools and off-model calculators used to analyze performance of the Regional Plan. Appendix F describes the Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern, including projected population, housing, and job growth.</p>
<p>L202</p>	<p>Director Ikhtrata boldly declares that it is the plan’s intention to pressure the public to change its wasteful use of personal motorized vehicles as a response to environmental concerns of growing proportions, as well as to meet various government mandates. He talks about incentives. But when queried about how the change in behavioral culture will come about, he repeatedly brings up “pricing”. He says “it will work if we price it right.” Of course “pricing” is a code word for “fees.” Using a euphemism cannot disguise what it is.</p>	<p>Thank you for your comment. SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. The initial phase of this study will focus on calculating the true cost of driving, and better understanding what sources of existing revenue are funding different parts of the system and how different populations are impacted by existing revenue mechanisms. This foundational understanding will help</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Invoking new fees, to use what has been considered to be something already covered by our taxes and DMV fees, is not an incentive. It is a penalty. The plan openly sets out to punish the public for doing what has been considered one of its most appreciated freedoms – the ability to get places, in the comfort and convenience of our own vehicles, on a timetable of our own choosing. SANDAG would have us give up this sacrosanct right and has set about to force the changes upon a recalcitrant public.</p> <p>The pricing scheme is so devious that it not only imposes fees and taxes (a penalty, not an incentive) to force people to stop doing what is considered an inalienable right, but then directs the funds it collects away from what is wanted by the public (highway improvements). What kind of incentive sets out to punish rather than reward?</p> <p>Let us not forget or ignore the penalties already inflicted on the driving public and the failures of previously imposed taxes to deliver what was expected or were diverted to other initiatives. For example I submit my motorcycle registration fee of \$233, which would cost me \$13 in NY. Or the income from the ½ percent TransNet sales tax that was grossly underestimated and is slated to be diverted from the highway projects it was supposed to support.</p>	<p>SANDAG to design a road usage charge program that is more fair than current transportation funding sources.</p> <p>The study will also assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no particular group, such as those driving fuel-powered vehicles, are paying more than their fair share.</p>
L203	<p>Now, looking at some of the initiatives in the RTP, there are data that belies the expected results. Director Ikhata was asked if he could provide an example of where MANAGED LANES was implemented. Oddly I-15 was used as an example. However, the design calls for Managed Lanes for I-5 and CA-78/56/52 without adding new lanes (except for repurposing shoulders), whereas the I-15 project created four additional lanes for HOV or toll-payer use. Unless all of the lanes are contiguous (which they are not) and narrow bridges are widened, the periodic merging of lanes would create new bottlenecks and backups. So would any breakdowns, public safety vehicles, or emergencies that would impact the travel lanes in the absence of shoulders. Is this really safe or practical? How would traffic control (police radar and traffic stops) operate? What happens in a medical emergency or when a vehicle has a mechanical problem, a flat tire, or runs out of gas or battery power? How is congestion reduction alleviated when a lane is isolated for busses? This model of managed lanes is more like a game of whack-a mole. I am apprehensive of drivers' attention being diverted from the road by a system of signs and signals directing them to a particular managed lane that changes with traffic conditions.</p> <p>How effective would the Managed Lanes concept be if it doesn't involve increased reliable capacity? SANDAG projects an increase in use of mass transit (at peak commuting times) from about 3% to 11.2% (in 2035). Will this be enough to sufficiently impact the carbon reduction goal? SANDAG is also projecting a population growth of 15.2% by 2035. It would seem that the movement of commuters to transit will not be enough to offset the growing demand for roadways. How do we significantly reduce congestion (a key goal) without increasing capacity? Do we gain enough to justify the cost and inconvenience of construction and repurposing plus the imposition of user fees?</p>	<p>The Managed Lanes concept is envisioned in the 2021 Regional Plan. They provide a system of managed lanes allowing the opportunity to dynamically manage the lanes based on real time conditions, time of day, and vehicle occupancy, to make all lanes more efficient and provide benefits to the system as a whole.</p> <p>Public safety impacts of the proposed Project are discussed in section 4.16 of the Draft Environmental Impact Report, specifically impact TRA-3, which analyzes any increases in hazards due to design features.</p>
L204	<p>On the other hand, there are other conditions that might represent a reduction of emissions-producing vehicles. Among the important forecast values that we must consider for the RTP is the impact of electric vehicles. All manufacturers are making massive investments and commitments to have a majority of their output be EVs, within a decade. Governments are equally committed to replacing petroleum-fueled vehicles by 2035. Are we likely to gain more in the real goal of reduced greenhouse gases through the mandated and incentivized move to EVs?</p> <p>When the shift to EVs is added to the impacts of more workers not having to drive to an office every day, potentially offsetting the population growth, the expense and "pricing" of the full managed lanes solution may not be warranted. Not if the justification is the reduction in the production of GHG. As an aside, we have to learn not to justify massive, expensive projects because there is government funding earmarked for such programs. Yes, I am thinking of California High-Speed Rail. These programs always end up growing extensively beyond the original (misrepresented) scope and cost, causing the agencies that thought that they were getting a free lunch to bleed real cash.</p>	<p>Thank you for your comment. The 2021 Regional Plan commits SANDAG to making investments to support the region's transition to electric cars, trucks, and buses. To achieve GHG reduction targets, the 2021 Regional Plan relies on both the transition to electric vehicles and managed lanes.</p>
L205	<p>Let's get back to the "incentives" to get drivers to shun their cars. The "right" pricing essentially means making it painful to pay the VMT (vehicle miles traveled) fees. What I am hearing now is a charge of two cents per mile for the state plus two cents per mile for the county. So a highway trip from Rancho Bernardo to downtown and back would cost about two dollars. That is enough to make people angry, but not enough for them to use other means for travel. If they don't meet the HOV criteria, it's either pay additional fees or be limited to what are designed to be slower lanes. In the latter case, how does that help relieve congestion? It just pushes lower income drivers to use the most congested lanes. How does that support the stated "equality" goals?</p> <p>The "right" pricing – that is; fees that will cause drivers to shun the controlled highways – may eventually lead to drivers eliminating such trips altogether. That may help the goal of easing congestion. But there will be offsetting penalties if the cancelled trips lead to people not shopping, eating out, or going to entertainment venues. This, in turn, will reduce income from sales taxes as well as impact the bottom line of these businesses (more tax losses). Has this been factored</p>	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>As usage-based fees are further studied, SANDAG will complete an Interstate 15 Operational Study to build</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>into the equation? When combined with other initiatives, such as reducing or completely eliminating parking in many areas, both business and residential, the campaign against car owners becomes draconian. The thinking is that if people are using MASS TRANSIT and local connection options there will no longer be a need to own a personal vehicle. So whether you're going out to the mountains to go hiking, or over to Costco to load up on groceries and a 30-roll package of toilet paper, can you say that you really don't need a car?</p> <p>Sure! Hey guys! Let's grab our beach chairs and umbrellas, the cooler, our cornhole game and a couple of surf boards and take the bus over to Cardiff State Beach (from Green Valley in Poway). And we'll stop off for dinner in Rancho Santa Fe on the way home, toting all our stuff. Currently, there is no reasonable mass transit to support that (according to MTS trip planner). The software did come up with a solution that would take four hours just to get to the beach, using four busses and the Sprinter (plus some walking) and told me to start 90 minutes earlier than I had specified. Is better coverage in the works? Would the group be able to make the trip in one day? Could they manage with all their gear?</p> <p>So let's stop dreaming about a world without cars. Can we be practical and come up with ideas and real incentives to cut down on VMT?</p> <p>Furthermore, as an "incentive" to dump your car or truck, the plan calls for charging for parking spot use and even to pull over to the curb. Yes, it's in the plan – see page 40 "Parking and curb pricing." Pricing is the term that is used for "fees."</p> <p>With the estimate of only 11.2% of commuters using mass transit (and less for the general public) what we need is more parking. We shouldn't need to drive around looking for parking spots or hang out at the curb with the motor running. If you want to change behavior, do it with rewards, not with penalties. While there are some interesting ideas in this plan, I predict that the overall result will be to nickel and dime car owners in multiple ways without actually achieving the results that are expected.</p>	<p>upon the success of the managed lanes currently operating in the region.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.</p>
L206	<p>The concept of MOBILITY HUBS is interesting. Providing flexible transit in selected concentration areas would be sensible and likely take care of some of the "last mile" issues that hinder the practicality of using mass transit. Here again, there are disconnects between wishful thinking and practical outcomes. The mobility hubs may be considered to be frequent destinations for the public. But what do people do on the other end (their origination point) when it's not in a mobility hub area. I reside about 1 ½ miles from the eastern edge of the Rancho Bernardo mobility hub (92128). About half of my family travel is to points within that hub. But how do I get to that hub without a car? (I do use my e-bike for some of this, but not if I am shopping or if I have to cross hazardous intersections, such as the I-15 ramps.) The expectation that businesses will all of a sudden relocate to properties within a mobility hub is speculative, at the most. Where is the evidence? Furthermore, if the new model is for these businesses to not have parking then the people will choose to take their business elsewhere. In the end, SANDAG may achieve their goal to reduce VMT. The public will do their shopping on-line. They'll enjoy their own cooking at home. And the biggest accomplishment will be a local business decline and more tax losses. The roads will be wall to wall with gas-guzzling Amazon vans.</p>	<p>The regional network of Mobility Hub areas overlaps with communities that already feature higher concentrations of people, places, and trip-making. As SANDAG partners with cities, transit agencies, and additional entities to deploy Flexible Fleet solutions these services will not only help people travel within a hub but also to places beyond and between hubs. Please refer to Figure 2.4 in the plan which illustrates how Flexible Fleets expand coverage to neighborhoods beyond the mobility hub areas. In areas outside of mobility hubs, Flexible Fleets such as shared, electric, and eventually autonomous shuttles would be available on-demand, ready to take you where you need to go. Today, services like on-demand rideshare, microtransit, and vanpool already provide a convenient travel option in areas where traditional fixed transit may not work well.</p> <p>The 2021 Regional Plan does not assume existing businesses would relocate to mobility hub areas. Rather, these are areas where future growth can be focused to accommodate projected population, housing, and job growth in the San Diego region. Since our region is approximately 90% built out, the plan assumes some growth in populations and jobs can occur in the mobility hub areas. However, there's no expectation for sudden re-location as the plan's transformational transportation system has been designed to better connect where jobs are already situated. Some infill can occur in employment centers such as what's happening in communities like Kearny Mesa.</p>
L207	<p>Bringing usable, frequent mass transit services to San Diego is something that we can all appreciate. But assuming that the car culture will significantly change because of the transit improvements is pie in the sky. No amount of disincentives will remove the need for highways and parking. From a personal perspective (I live in 92128), I see little that serves my needs or interests. This area and adjacent Poway and places east are hardly served (except for a snippet of the RB mobility hub). The proposed Rapid bus is the same as now, except with improved frequency. But the transit stations are not easily accessible except by car. With all the plans for commuter rail and light rail, the I-15 corridor is ignored. That is; except for the ghost of the California High-Speed Rail, which surprisingly shows up on Figure 2.3 – the Transit Leap map. I suspect that most of San Diego will have fallen into the Pacific before this foolhardy venture reaches any place where people live, let alone stretching south of I-10. Placing it on the Transit Leap map doesn't help to generate any confidence in the rest of the plan.</p>	<p>Thank you for your comments and your interest in mobility in our region. We encourage you to stay engaged by visiting <a href="http://SDForward.com">SDForward.com</a>. Public engagement will continue until the Board is asked to adopt the 2021 Regional Plan in December 2021.</p> <p>Regarding the I-15 corridor, the I-15 Corridor is difficult to serve with rail because of the development patterns which resulted in widely spread out communities. This area is served by Rapid bus routes which will be expanded in the future with more services.</p>
L208	<p>In regard to this Bakersfield/Fresno/Merced rail, I hear horrifying stories of issues with acquiring land rights. Have the experiences from that venture been factored into the land acquisition needs for transit and mobility hubs? If land</p>	<p>The implementation of the proposed 2021 Regional Plan will be a truly collaborative effort between SANDAG, local jurisdictions, transit agencies, private developers, and employers. While land acquisition may be considered for certain projects, land use decisions are reserved to local jurisdictions. Innovative public-private</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	acquisition is an issue in the sparsely populated SR-99 corridor, have we honestly considered the challenges in coastal San Diego? Is this a deal killer?	partnerships can be forged to fund, design, and implement various aspects of mobility hubs including stations, complete corridors improvements, and other mobility hub amenities.
L209	Back to my personal travel habits and needs. I recently purchased an e-bike and use it almost daily. I take it to the tennis courts on week days – just less than a mile and with no major intersections. I love the ride and am happy to not use my gas engine vehicles for such short trips. But the e-bike is not practical for most errands and my primary use is for exercise and recreation. There are several areas where I cannot ride because of poorly maintained bike lanes or unmarked bike lanes in high-traffic streets and intersections. The nearest formal bike trail (I-56) is about a ten mile ride over a treacherous, unmaintained bike lane on Carmel Mountain Road in Rancho Penasquitos. The money available for biking would be better spent on improving these impediments than in uprooting city streets to make us look like Holland. Also, I would not be able to use the e-bike with mass transit because the bike is too heavy to put on the bike carriers. (Does anyone ever use these? I never see a bus with a bike. I also never see a bus with more than two passengers.)	As an early action out of the Regional Plan, SANDAG will be developing a new Active Transportation Plan. The plan will take a fresh look at the network and the options to make it safe and comfortable to use active transportation.  Your comment was forwarded to the City of San Diego.
L210	I have not addressed the practicality of the proposed high-speed coastal rail or other light rail expansions due to lack of details. Shouldn't we be looking at a set of alternatives, rather than a single plan? On the LOSSAN corridor segment, I'd like to see figures for a solution based on upgrading the Coaster system, rather than assuming that a new high-speed system is needed to meet our goals. The benefits of a high-speed train tend to be grossly overstated when one considers that the actual rail time is just a small portion of the overall door-to-door trip time. Doubling the speed of a locomotive may equate to a 5% to 10% improvement in trip time. Increasing distances between stations makes the use of high-speed rail less convenient and may add additional time to last-mile segments. Frequency (less waiting time) may contribute more to shortening trips than high speed. It is good to see this in the plan.	The Regional Plan identifies investments in the LOSSAN corridor to improve capacity, speeds, safety, frequency, and significantly reduce travel time primarily due to higher-speed realignments with the Del Mar Tunnel and Miramar/UTC Tunnel. In 2020, SANDAG began work on a Regional Rail Alternatives Alignment Study ( <a href="https://www.keepsandiegomoving.com/Libraries/Lossan-PDFs/SAN-LOSSAN-DMB-FactSheet_LongTermAlignment_11-10-2020.sflb.ashx">https://www.keepsandiegomoving.com/Libraries/Lossan-PDFs/SAN-LOSSAN-DMB-FactSheet_LongTermAlignment_11-10-2020.sflb.ashx</a> ) that identifies incremental higher-speed upgrades to the LOSSAN corridor to meet the goals in the Regional Plan.
L211	<p>On a final note, I am compelled to comment on some disturbing issues relative to the relationships and behavior between the agency (SANDAG), the SANDAG Board of Directors, and the public. There is no way that we can accept the response by Director Ikhata to criticism voiced by board member Rodriguez (Oceanside), at the 5/21/21 SANDAG presentation. Obviously dismissing the board member's right to question the RTP, Ikhata interrupted to say "We are the experts." It is this attitude that highlights the importance of the Board exercising its responsibility to provide oversight and leadership for this important agency.</p> <p>We must further question the intent of Director Ikhata to influence the recent Supervisor election, and hence the selection of board members by making a political contribution to a likely supportive candidate in opposition to a candidate that voiced resistance to the developing RTP. How these two incidents can go unchallenged is beyond belief. Where is the oversight?</p> <p>As I began to follow the RTP, the early news headlines consistently noted the sense that the Board was heavily leaning toward support for the emerging RTP. It appeared to represent a desire to take strong action to deal with the very real concerns regarding global warming and to address how re-envisioned transportation models can contribute to a viable solution.</p> <p>Politically, it seemed sound to jump on the band wagon. However, as the details of the RTP were meted out to the public, there has been virtually unanimous rejection of the Plan. The public is saying that they do not favor the RTP and cannot see it as something that will produce the stated goals. One comment: "This is NUTS!" The board needs to listen.</p> <p>As a concerned voter in San Diego County, it is my expectation that our representatives on the SANDAG Board of Governors will ask the type of questions that I highlighted here and to make certain that the RTP is based on honest assessments and assumptions. Due diligence requires that proposals consider a range of outcomes, based on an open-minded assessment of risks and variables. Common sense requires that we fully consider human factors and culture. Transparency should come with honest language that does not sugar-coat the burdens to be placed on the public to gain compliance.</p> <p>I ask the SANDAG Board of Directors to provide intelligent oversight of SANDAG and the RTP, and to recognize the voice of the people in questioning the rationale and achievability of the proposal.</p>	Thank you for your comment.
L212	High-speed Rail: Going from 60 MPH to 120 MPH will not deliver a great time savings if distances between stops are greater and time from station to destination is increased. The easiest and most economical way to make train-based travel faster is actually to have stops closer to the "last-mile" and to up the frequency so that travelers don't have to spend the projected time gained waiting for the next train. Commuter rail, with short distances will not gain much from doubling the top speed. Electrification will help acceleration times and reduce GHG emissions. Can we modify what we already have and still achieve our goal -- faster and cheaper? Urban/suburban rail should run every four minutes in peak travel times and every eight minute at other times. At the least a ten minute interval would free travelers from needing	Thank you for your comments and your interest in mobility in our region. We encourage you to stay engaged by visiting <a href="http://SDForward.com">SDForward.com</a> . Public engagement will continue until the Board is asked to adopt the 2021 Regional Plan in December 2021.  The 2021 Regional Plan proposes increased frequencies, longer spans of service, grade separations, and express service on the existing transit system in addition to an expanded transit network with new higher speed commuter rail in the highest demand corridors.

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L213	<p>to use timetables. Stations should be closely spaced and easily accessible by walkers and bikers as well as personal vehicles. Adequate parking will be needed. Express trains can be added to accommodate longer distance riders.</p> <p>Managed Lanes: The biggest cause of highway congestion is the intermittent loss of a traffic lane. You can see that every day in places like I-15 northbound as it approaches the Bernardo Center Dr. and Rancho Bernardo Rd. interchanges. In this very short distance, the main highway loses one lane (due to narrow overpasses) and the traffic will back up at times of heavy use. Other causes of backups are vehicle breakdowns, police activity, and accidents. There MUST be space for vehicles to pull to the side of the road without losing a traffic lane.</p> <p>The maximum capacity of any highway is determined by the capacity at its most constricted point. The plan calls for increasing capacity on limited access highways, such as SR-56, by utilizing shoulders. SR-56 would increase from four lanes to seven lanes. However, the inner shoulders are only four to eight feet and they do not continue at the six locations where the highway goes over a bridge. It seems that this would require adding lanes on the existing divider and building six new bridges at the overpasses to accommodate the three additional traffic lanes. Without this, the bottlenecks would nullify any gains from the added lanes.</p>	<p>Managed lanes are meant to be flexible based on the needs of the corridor at different times of the day by using real-time data through the Next Operating System (Next OS). In the event of a breakdown or accident lane designations can shift to accommodate emergency vehicles while managing traffic flow.</p> <p>SANDAG and Caltrans are currently preparing several Comprehensive Multimodal Corridor Plans which aim to create a comprehensive set of safe, sustainable, and equitable transportation solutions that are tailored to the needs of the corridor. The design and operation of the managed lanes network will be further assessed through these Plans and other detailed engineering studies.</p>
L214	<p>Rapid Bus Plazas: These will have to be considerably upgraded if Rapid Bus is to be a principal component of a four-fold increase in mass transit patronage. As I look at the plaza closest to my residence, Rancho Bernardo, I see some major issues. Parking would have to be significantly increased, since the planned Flexible Fleets in Mobility Hubs will not reach all users. Plazas would likely need to be enlarged. Where will we find the land for this?</p> <p>Also, at Rancho Bernardo, the transit plaza is not accessible from the east side of I-15. Walkers or bikers cannot readily get to the plaza. This can be remedied by building a pedestrian/biker structure from the east side of the I-15 bus ramp, over the northbound lanes of I-15 to adjacent Iberia Pl. This would provide easy access to the downtown business area of RB and several residential neighborhoods that do not have that access now. For me, the walk or ride would be 1.2 miles, rather than 2.6 mi via dangerous route and 3.0 miles via safer route.</p>	<p>Flexible Fleet services can extend beyond Mobility Hubs to get travelers to and from their origin, destination, and fixed transit stations. SANDAG will work closely with local jurisdictions and transit agencies to design transit stations and stops to meet the needs of the surrounding community. We encourage you to stay engaged by visiting <a href="http://SDForward.com">SDForward.com</a>. Public engagement will continue until the Board is asked to adopt the 2021 Regional Plan in December 2021.</p> <p>Your comment was forwarded to agencies that oversee these facilities.</p>
L215	<p>Biking: I have recently joined the population that is using bicycles for short trips, as well as recreation. Mine is an e-bike and I can easily do round trips of up to 30 miles, even with the hills in my area. What I can't do is to make these trips in safety. The city and SANDAG are hyping their support for biking to alleviate some of the pollution and congestion caused by motor vehicles. But they can't even maintain the bike paths that we already have. Also, to use bikes for commuting (SANDAG is counting on at least a tripling of biking to work) we need well marked bike lanes and paths that are contiguous. Many of the areas are interrupted by stretches of missing or unmaintained bike lanes. We need more consistent riding paths and much improved driver education and awareness. The recent efforts to use green paint for bike lanes and to add a buffer between the bike lane and car lane need to be expanded as rapidly as possible. Adding a well-marked bike lane at left turns would be a welcome safety addition. I have seen this only at one place, the intersection of Carmel Mountain Rd. and Rancho Carmel Dr (next to Costco).</p> <p>With 12 deaths to bikers in seven months, more has to be done promote safety. Countless injuries are awaiting bikers that are forced to ride on unmaintained bike lanes, opening up municipalities to large law suites.</p>	<p>The 2021 Regional Plan aims to create safe and well-connected routes for bicyclists and pedestrians. The intention of the network in this Regional Plan is a framework which facilitates trips associated with regional purposes designed to enhance neighborhood connections to schools, employment centers, and other everyday destinations. The regional network will not include details regarding the types of bicycle and pedestrian facilities for specific projects are not yet determined and will require future planning and coordination with local jurisdictions, community members, and other stakeholders.</p>
L216	<p>Reducing Carbon: The RTP aims to reduce GHG emissions, primarily by penalizing travel with cars and trucks. However, as I interpret the plan, the methodology is aimed at generating new income from road usage fees. The plan bemoans the loss of gas tax income from drivers of EVs. Instead of providing incentives for driving EVs, the plan requires that EV owners pay a fee to cover the gas tax losses and then, adding insult to injury, earmarks that revenue for mass transit.</p> <p>Would it not make more sense to offer payments to gas and diesel car and truck owners to turn in their cars and get them off the road? Couple this with rebates to exchange their petrol cars for EVs.</p> <p>California registration rates are backwards. The fees should be based on weight and gas mileage, not property value. A Chevy Tahoe produces more wear and GHG than a Porsche 911. But the Porsche owner pays way more for registration. The owner of a BMW K1600 motorcycle pays more than for a Ford Fiesta. The latter weighs more than three times as much and uses twice the gas, but pays less for the registration. EV owners, with vehicles that are emission free and have less aggressive tires should get a break.</p> <p>This may be extreme, but if you really want to cut GHG you can go to fuel rationing. There is a direct relationship between the fuel burned and the amount of emissions. But this would not work in the face of a model which is designed to generate usage fees, rather than cut emissions. It would also cut revenue from gas taxes. This may be an underlying factor in a model that is designed to generate income from fuel burners while the goal is to reduce the use of fuel. It is more likely to build the fee income than to achieve the stated goal.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target is achieved by a number of strategies, including reducing per capita VMT.</p> <p>The GHG Inventory (Appendix X) analyzes emissions from all sources and the projections account for state and federal legislation currently in place, as well as strategies within the 2021 Regional Plan. The 5 Big Moves will result in people having more travel options and operating solutions, reducing per capita VMT, and the local jurisdictions can identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</p> <p>The Regional Plan supports investments in the electrification of cars, trucks and buses and their supporting infrastructure (e.g., EV charging stations and hydrogen fueling stations). These electric vehicle investments are one of the ways SANDAG is working to reduce regional GHG emissions and improve local air quality. Appendices A (Table A.17) and B show SANDAG's proposed EV commitments such as regional electric vehicle and charging infrastructure incentive programs. Innovation and advanced technologies will be critical to meeting regional GHG reduction goals in 2035.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

<b>Jacumba Community Sponsor Group</b>		
L217	On page 10, the plan states that in 2019, greater than 90 percent of CA-MEX trade was moved by truck across the international border. A great fact to know, but where does your regional plan address and mitigate for the smoggy trucks registered in Mexico that are hauling those goods? Will the plan only regulate the emissions of vehicles registered in San Diego County (or California) while out-state and out-of-country (Mexican) vehicles get a “free pass?”	<p>In California, regulation of vehicle emissions is managed by California Air Resources Board (CARB). CARB conducts inspections of heavy-duty trucks traveling in California including those registered out of state and from foreign countries. At border ports of entry CARB inspects heavy-duty trucks for excessive smoke, and engine certification label compliance. SANDAG partners with CARB and the San Diego Air Pollution Control District on air quality conformity (see appendix C) and emission reduction strategies across the region.</p> <p>In addition, SANDAG is committed to the following actions:</p> <ul style="list-style-type: none"> <li>• Pursue programs and projects to further policies focused on electrification of fleets, and Executive Order N-79-20 related to sales of zero-emission personal and medium/heavy-duty vehicles.</li> <li>• Plan for goods movement strategies that reduce border congestion that exacerbates emissions resulting from vehicle delay.</li> <li>• Continue coordination on strategies identified in the 2021 California-Baja California Border Master Plan.</li> </ul>
L218	On page 12, the plan states: “from 2016 to 2050, nearly 60 percent of population growth will be among those who are 75 years and older.” Will this aging population (60 percent who are projected to be people of color), feel physically safe while using public transit (buses, trams, trolleys) during evening/night time? Will they all have smart phones and be able to navigate a smart phone application that gives them a choice of transportation modality based on a variety factors including CO2 emissions?	<p>SANDAG has a long history of working closely with senior community members, social service providers, non-profits and community-based organizations to develop and fund specialized transportation services geared specifically towards the needs of seniors. The Regional Plan network includes a variety of modes that work together seamlessly to provide all San Diego residents, regardless of age or ability, access to multiple travel choices. Flexible Fleets are an example of an option that is particularly well suited for the senior population. Flexible Fleets options like ridehail, rideshare, and microtransit, offer a range of mobility options and vehicles that can accommodate many types of trips and meet the needs of various users. They can make it easy for seniors to access medical appointments and other basic needs without relying on a car. Flexible Fleet vehicles and services are adaptable in nature and can offer personalized accommodations, such as wheelchair lifts, door-to-door services, and other options for people with physical limitations. SANDAG has conducted outreach and will continue to engage with seniors to ensure their mobility needs are met. In addition, SANDAG is developing a Flexible Fleets Implementation Strategic Plan that will address potential barriers to accessing Flexible Fleets, ensuring options for people without smartphones or internet, providing education about how to access Flexible Fleets, and more.</p> <p>SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, MTS has reprioritized security funding from fare enforcement to safety improvements.</p>
L219	On page 15, the plan states that if the 2021 plan was implemented, “By 2050, this could result in 13 percent of commuters using transit (up from 3 percent today) and that there would be a substantial decline in commuters driving alone to work (from 80 percent today to 62 percent in 2050). Those figures do not reflect any significant behavioral changes regarding transportation choices given that this plan would greatly expand mass transit frequency and routes. In 2021, many city busses are carrying just two to three passengers while trolleys carry more passengers depending on their routes. How realistic are the 2021 plan’s predicted increases? Were urban residents asked about factors that would actually make them leave their cars and use mass transit instead? Was the current trend of working remotely from home factored into these calculations? What if the public perceives that it is not in their best interests to share a bus or a trolley with a group of strangers who may or may not be healthy? What happens when the next pandemic impacts our region and mass transit shuts down for public safety reasons? Clearly more studies on the current trends in mass transit usage must be analyzed before the predictions contained in this plan can be validated. Also, additional studies on post-COVID mass transit usage figures are critical. Analysisists should avoid using the data from any month when all mass transit ridership fares have been waived, as they will skew the data. (This will happen in September 2021.)	The performance of the 2021 Regional Plan is based on the best available data at this time. It will be important to continue to monitor trends and impacts to travel behavior as the Regional Plan is implemented and updated in the future. Priority Implementation Action 10 is to advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery.
L220	On page 25, the 2021 plan calls for providing a variety of transit riders with reduced fares (seniors, low-income, students, youth and the disabled). This is fiscally untenable. What is the actual cost per passenger mile on a bus, trolley, or light rail? Appendix A predicts that in 2020 dollars, transit fare subsidies in 2035 will be \$982 million dollars and in 2050, subsidies will be \$4 BILLION dollars which means that the answer to the previous question about the cost per passenger mile must be too high to print!!! This plan cannot seriously contemplate spending \$4 billion dollars to possibly achieve a 13 percent increase in mass transit ridership.	Yes, the Regional Plan envisions a public transportation system that is cheaper to ride than in the past. By offering these lower fares, more residents, especially those in disadvantaged communities, will be able to afford transportation freedom. SANDAG has prioritized equity in San Diego Forward: The 2021 Regional Plan (2021 Regional Plan) more than ever before. Promising a system that is faster, fairer, and cleaner, the planning efforts intend to uplift people who have been historically faced with social injustice.
L221	The 2021 plan which seeks to “reimagine” regional transportation strategies appears to be a huge and costly wish list of programs and government regulations directed primarily at changing residents’ driving behavior at a tremendous loss of personal freedoms. It envisions spending millions of dollars to create an expanded bike network with corridors by	Build out of the Regional Bike Network along with investments in complete streets and Vision Zero programs are components of the 2021 Regional Plan that advance goals related to reducing greenhouse gas emissions, improving safety for all users, and advancing public health.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	2050. Again, where is the data that shows that kind of expenditure will get more people out of their cars and onto bicycles? A recent case in point: the removal of 400 parking spaces along the business district on 30th Street in the North Park area so that bike lanes, that are rarely used to commuting to and from work, could be installed. Not only are the merchants upset about the loss of customer parking and business, but delivery trucks are now blocking bikes lanes to make their deliveries and handicapped parking has become confusing for those who need it. The 2021 plan will greatly expand on that unpopular and costly transportation strategy.	
L222	Under this plan, transportation in and around mobility hubs or areas of concentrated development (cities) would be highly regulated with curb management regulations/fees based on the time of day parking rates, and ride-hailing opportunities. Ride-hailing at mobility hubs is described as offering people on-demand vehicles for short and long-distance trips, possibly subscription-based services which would “allow people to reserve a vehicle that best serves the needs of their trip.” So, it is okay to rent/drive a vehicle but just not to personally own a vehicle?	Flexible Fleets are shared, electric, mobility services that provide greater options for making trips around the region. Different vehicles allow you to pick the service that best meets your needs and provide an option for people to rent a vehicle or share a ride as that can be more convenient and affordable than owning a personal vehicle.
L223	On page 32, the plan states: “In the San Diego region, almost half of all trips are three miles or less, and most everyday trips are made within neighborhoods using local streets.” Where is the data to back up this statement? This page also states: “On average, one person is killed or seriously injured in traffic violence everyday in the region.” Everyone understands the safety risks that they take when they drive a car and they believe those risks to be acceptable. Again, no driving statistics are referenced, and of course, the plan does not provide data on the numbers of people who are mugged walking down the region’s streets or at trolley stations, etc.	The SANDAG travel demand model is the data source for the region’s daily trip making estimates. Person trips, travel behavior characteristics, and related decisions are based on empirical data collection efforts conducted by SANDAG, Caltrans, and the federal government. Out of more than 13 million daily trips completed by residents, more than 6 million of those trips are 3 miles or less.
L224	Everyone agrees that climate change is real. On page 34, several climate strategies are listed. The blue pie chart at the top of the page lists “collecting rainwater” as one viable climate mitigation strategy. Why doesn’t this 2021 plan identify more impactful strategies such as building new reservoirs/expanding existing ones or building additional desalinization plants? It should be noted, that even if the 2021 plan is implemented, it will not stop the sea levels from rising.	The Venn Diagram on page 34 of the 2021 Regional Plan, is illustrative in nature, offering graphics to accompany the definitions for mitigation, adaptation, and resilience. The local jurisdictions and other public agencies, including water authorities, can and will identify climate strategies beyond what is included in the 2021 Regional Plan. New transportation infrastructure projects will be engineered to integrate adaptation strategies that consider the best available science, tools, and technology to make them, and the region’s transportation network, more resilient to the impacts of climate change, such as sea level rise.
L225	This plan would require employers and developers to provide transportation benefits and on-site amenities to encourage people to use sustainable transportation choices. Does the County want even more businesses to flee California for a friendlier business climate? Employers can figure out how to use flexible work schedules and tele-work options to attract and sustain their workforce without unnecessary government intervention/regulation.	The 2021 Regional Plan proposes a Transportation Demand Management Ordinance that would require employers over a certain size to provide transportation benefits and amenities that encourage sustainable transportation choices. These types of TDM ordinances exist in other regions across the state. A near-term implementation action would be to complete a Transportation Demand Management Ordinance Policy Analysis. This policy analysis would detail the employers that the ordinance would apply to and mechanisms for implementation and enforcement.
L226	Of course, of the 2021 plan’s proposed transportation management “strategies” come at a huge cost (\$163 billion dollars). The plan identifies \$90 billion dollars that will come from local funding sources: sales taxes, impact fees, fuel taxes, roads tolls, increased passenger fares, general funds, housing revenue, ride-hailing fees, value pricing, and road user charges also called vehicle miles travelled (VMT). Road usage fees or VMT, which have yet to be implemented through legislation, are needed to offset the reduction in gasoline taxes as more electric vehicles (EV) use our roadways. Under this plan, VMT fees would come on top of the existing federal, state, and local gasoline taxes, and they would unfairly penalize the drivers of gas-powered vehicles, who frequently are the low-income residents who live in the rural areas of the County. (VMT would not be collected on out-of-state vehicles.) Under the 2021 plan, fees of all kinds would be raised, including variable road tolls based on the time of day (congestion), fees for solo drivers using carpool lanes, and fees for ride-sharing services like Uber. The fees and regulations imposed by this plan will disproportionately impact low-income residents, while the plan claims to promotes social equity. They are the ones who will not be able to afford to park/drive their own private vehicles while transportation choices of more affluent residents will not be affected.	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.</p>
L227	Figure 3.3 on page 50 shows the 2021 Regional Plan Expenditures with an estimated total of \$163 billion in 2020 dollars. There needs to be a similar pie chart within the 2021 plan that shows how much money will be spent on each	As noted in the comment, this information is available in Appendices A and U of the 2021 Regional Plan.

	<p>transportation category: Transit Leap (mass transit), mobility hubs, complete corridors, bicycle network, highway improvements etc. Although there may be appendices that lists all the funding for a specific category, it is unlikely that most people will wade through all of them to find that important information.</p>	
L228	<p>On page 53 of the 2021 Regional plan is a list of a priority implementation actions. Number 1 on the list is “Apply the Social Equity Planning Framework”. Number 10 on the list is: “Advance a data science program to better understand travel behavior in the region.” These priorities should be reversed. You can’t apply a framework until you have solid, valid, and recent (post COVID) data!</p>	<p>Each of the 10 priority implementation actions have both near-term and continuing actions. Implementing the 2021 Regional Plan will require coordination across all 10 priorities.</p>
<p><b>James Brown, Bread &amp; Salt and Public Architecture</b></p>		
L229	<p>I have been a Logan Heights business owner for over 12 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)</p> <p>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the 1-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</p> <p>As mentioned, the construction of the 1-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that 1-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal - a freeway lid is the answer.</p> <p>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are: The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)</p> <p>Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</p> <p>Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)</p> <p>Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.</p>	<p>Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</p>
<p><b>Martha Zapata</b></p>		
L230	<p>I have been a Logan Heights resident for 34 years. Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Plan (Draft Plan)</p> <p>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</p> <p>As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.</p> <p>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:                      The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)</p> <p>Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</p> <p>Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)</p> <p>Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.</p>	<p>preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.</p>
<p><b>North County Transit District</b></p>		
<p>L231</p>	<p>Regional Capital Project Prioritization and Implementation</p> <ol style="list-style-type: none"> <li>1. NCTD seeks clarity on the status of specific projects that were included in the constrained TransNet funding plan but are at risk due to lack of funding. NCTD is seeking information on how much of the estimated \$160 billion proposed plan estimate is allocated to complete these unfunded TransNet projects on a project-level basis. NCTD is seeking more detailed information that expands upon the corridor-level information included in Appendix A: Transportation Projects, Programs, and Phasing of the Plan.</li> <li>2. NCTD seeks clarity on the project phasing proposed within the Plan. Specifically, NCTD is seeking to understand the timing of implementation of unfunded TransNet projects related to new projects presented within the Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 1 (Attachment B).</li> <li>3. NCTD seeks clarity on the assumptions related to the completion of major capital projects, including the assumed percentage level of federal and state match funding required to implement the projects envisioned in the Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 1 (Attachment B).</li> <li>4. NCTD seeks specific data on the proposed 200 miles of rail service contemplated in the 2021 Draft Regional Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 3 (Attachment D)</li> </ol>	<ol style="list-style-type: none"> <li>1-2. A comparison between the <i>TransNet</i> Program of Projects and the Draft 2021 Regional Plan was included in the July 7, 2021, ITOC Agenda Item #2 (<a href="https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf">https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf</a>). In addition to the report narrative, you will find in Attachment 1 the details regarding the original <i>TransNet</i> projects and how those are addressed in the Regional Plan corridor by corridor.</li> <li>3. The Regional Plan relies on a host of revenue sources with various matching requirements and funding eligibility constraints. Once projects reach the programming stage, specific funds are identified from specific sources in order to include those projects into the Regional Transportation Improvement Program (RTIP). With regard to <i>TransNet</i> projects, there are projects that remain on the <i>TransNet</i> extension list of projects that are being reimagined in the draft 2021 Regional Plan as part of a regionwide system. A report on these projects was brought to the SANDAG ITOC on July 7, 2021, which explains what <i>TransNet</i> projects have been completed, what projects remain, and the approach to provide multimodal solutions in these remaining corridors as part of an integrated systems approach. This report is available here: <a href="https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf">https://www.sandag.org/uploads/meetingid/meetingid_5886_29414.pdf</a>.</li> <li>4. Both the Batiquitos Lagoon Double Track and Carlsbad Village Trench projects are included in the 2021 Regional Plan. These projects will complete LOSSAN double tracking within the City of Carlsbad in generally</li> </ol>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

L232	<p>Operational and Financial Assumptions</p> <ol style="list-style-type: none"> <li>1. NCTD seeks specific data on the proposed dedicated source of funding to be used to provide reduced or free fares within the region. NCTD believes that it is important that SANDAG identify a source that is not sales tax based to mitigate impacts to service levels during economic downturns. The source of funding should also match increases in operating costs.</li> <li>2. NCTD seeks specific data on the proposed level of funding that is proposed to be dedicated to transit operations, preventative maintenance, and state of good repair maintenance and replacements, respectively.</li> <li>3. NCTD seeks specific data on the assumed transit service frequencies throughout the duration of the plan, and specifically as it relates to local transit bus operations. To support this, NCTD is requesting that SANDAG input the information requested in Table 2 (Attachment C).</li> <li>4. NCTD seeks specific data on plans and funding that will be allocated to support road, technology, and other infrastructure improvements to advance faster, frequent, and more reliable transit service.</li> </ol>	<p>the same alignment. Some segments of the LOSSAN corridor and will likely include fencing will remain at grade with fencing.</p> <ol style="list-style-type: none"> <li>1. Fare subsidies may be attached to sales tax measures but could be paid for by other sources as they become available.</li> <li>2. Systemwide Operations Costs are shown in Appendix A in Table A.16.</li> <li>3. Additional data on transit frequencies and span of service has been added to Appendix A as Attachment 2.</li> <li>4. Local streets and roads funding can be found in Appendix A in Table A.18. Next OS operating funds which will support transit optimization and other features to prioritize transit is shown in Table A.15.</li> </ol>
L233	<p>Customer Research Questions</p> <ol style="list-style-type: none"> <li>1. NCTD seeks clarity on the transit customer research conducted as part of the Central Mobility Hub planning process, either as part of the Draft 2021 Regional Plan development process or the Central Mobility Hub Comprehensive Multimodal Corridor Plan (CMCP) process. NCTD is specifically seeking information on transit user experience impacts related to the relocation of transit service from Old Town Station to the proposed Central Mobility Hub.</li> <li>2. NCTD seeks clarity on the transit customer research conducted as part of the Sorrento Mesa spur planning process, either as part of the Draft 2021 Regional Plan development process, SD-LOSSAN Rail Corridor Realignment Study process, or South Bay to Sorrento CMCP. NCTD is specifically seeking information on transit user access and user experience impacts related to the relocation of transit service from the existing Sorrento Valley COASTER Station to a proposed Sorrento Mesa location.</li> </ol>	<ol style="list-style-type: none"> <li>1. The Central Mobility Hub (CMH) and Connections CMCP included planning level concepts for a transit center at the Navy's Old Town Campus and the Intermodal Transportation Center site adjacent to Washington Street and Pacific Highway. These concepts incorporate local and regional busses, Trolley, COASTER, future Transit Leap services, Amtrak, and a direct transit connection to San Diego International Airport with connections to active transportation, Flexible Fleets, and pick-up/drop-off facilities. The concepts looked to minimize walk distances and provide easy transfer opportunities for transit users. The CMH is envisioned to also include transit serving amenities such as retail and dining establishments, ticketing facilities, and public restrooms. Additional locations and refinements of the initial concepts included in the CMCP will be examined in the CMH environmental process.</li> <li>2. SANDAG did not conduct transit customer research specifically related to Sorrento Mesa. A detailed data analysis was conducted on how to optimize our primary connections to Tier One employment centers, including Sorrento Mesa. The spur line is designed to provide a direct connection to the heart of the employment center while still allowing for freight and Amtrak to operate on the main line. It is envisioned that customer access and user experience will be enhanced by having a station that is located within walking distance of many of our region's largest employers.</li> </ol>
<p><b>Oceanside Bicycle and Pedestrian Committee</b></p>		
L234	<p>Our Committee has reviewed the draft 2021 Regional Plan and wishes to submit several comments for SANDAG consideration. First, as a general statement, the Committee appreciates the Plan's significant shift in how people move about in the region, as proposed through the "Five Big Moves" and interrelated projects and programs. We concur with SANDAG's conclusion that the imperative of responding to the climate crisis requires such a significant shift from previous Regional Transportation Plans. We also strongly agree with the statement on page 1 of Appendix L: Active Transportation, that: Active Transportation is a key element interwoven through the 5 Big Moves; it connects people to all kinds of destinations and defines the infrastructure needs to make the system work for everyone. With this statement in mind, we have specific input regarding several of the key Active Transportation projects which affect Oceanside, as listed in Appendix A, Page A-35, as follows:</p> <p>AT031 – Coastal Rail Trail Oceanside – Broadway to Eaton– This project appears to be off-street from Vista Way/Broadway to Broadway/Eaton (using the railroad right-of-way), then on-street on Eaton to Hwy 101. The existing portions of the Coastal Rail Trail north and south of Cassidy Street in this area are sub-standard (see photo) – the usable width of the trail in this section is only about 7 feet wide and does not provide sufficient space for cyclists to pass walkers safely without nearly coming to a stop. In addition, in preliminary City discussions with the Buena Vista Audubon Society, the possibility exists that the Society might allow development of the trail through their property south of the end of Broadway Street, connecting to the improved trail on Coast Highway. This would provide a safer and traffic-free connection rather than putting trail users directly on Eaton and Coast Highway. For these reasons, the City of Oceanside, with Committee support, submitted a Caltrans Sustainable Transportation Planning Grant request in February 2021, seeking funding for a "Coastal Rail Trail Morse-Vista Way Improvement Study". Please see our attached January 27, 2021 letter on same. We await word on the outcome of this grant request. Accordingly, we recommend that SANDAG include the potential for widening the trail in this area and connecting it through the Audubon Society property as part of Project AT031 and revise the budget accordingly</p>	<p>We appreciate the input from Oceanside's Bicycle and Pedestrian Committee members. The bike network shown in the plan is the Adopted Regional Bike Network, which was adopted in 2010. As an early action out of the Regional Plan, SANDAG will develop a new Active Transportation Plan which will look at adding in a number of new connections like these you have mentioned. Even sooner, I'd encourage your organization to be involved with the efforts of the North County CMCP if you are not already: <a href="https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=609&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=12&amp;subclassid=83&amp;projectid=609&amp;fuseaction=projects.detail</a></p> <p>SANDAG prioritizes community engagement and will develop these connections in partnership with the community so that we can make sure the routes take people where they want to go.</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>AT049 – Inland Rail Trail Oceanside – This project is intended to cover the entire Inland Rail Trail segment within Oceanside, from Melrose to west of I-5. The Committee strongly supports this project – completion of the Inland Rail Trail and the Coastal Rail Trail within Oceanside are the two top-priority projects in Oceanside’s adopted Bicycle Master Plan. The Committee’s concern about this project is SANDAG’s listed “Year Built” of 2035. Completion of the Inland Rail Trail has been an adopted goal of the north county communities it travels through since 1995, through a Memorandum of Understanding (copy attached). In that MOU, the corridor agencies adopted the following vision 25 years ago: NCTD and the sponsor agencies desire to create a multi-modal transportation facility which will help these communities achieve a higher quality of life by promoting alternative transportation opportunities, reducing automobile trips, improving air quality, reducing congestion, providing recreational opportunities, and increasing access to desired North County destinations. This trail has also been identified as a priority project in the SANDAG Ride to 2050 Plan and is key in promoting bike commuting in the region. The only nearby alternative to completing this trail in Oceanside is to ride on Oceanside Blvd., which is very challenging if not outright unsafe for cyclists given its narrow bike lane widths, complete disappearance of the bike lane at major intersections, high traffic speeds, and heavy truck volume. Simply put, the citizens of Oceanside should not have to wait 40 years for their portion of the IRT to be completed, when the communities across North County made it clear in 1995 that completion of this trail was a priority. This delay is not fair to Oceanside on a general basis and is further exacerbated by equity considerations – Oceanside is home to a significant minority population (52% composition) whereas other North County coastal cities have majority white populations ranging from 74% to 90%.</p> <p>The proposed SANDAG Regional Plan includes a significant “Focus on Equity”, including the statement, In developing and implementing the 2021 Regional Plan, SANDAG has a responsibility to listen to the communities we serve, prioritize equitable solutions in the transportation system, and analyze the burdens and benefits of this system for historically underserved communities<sup>2</sup>. While Escondido and San Marcos had all or portions of their IRT constructed by 2008, and Vista’s segments are completed, in design, or under construction now, the Oceanside segment is not even in preliminary planning at this time. Given the frequent mention throughout the Regional Plan of the importance of bike trail improvements to the overall success of the Plan, and the Focus on Equity, we implore SANDAG to move up the completion of this segment of the IRT commensurate with its importance to the Adopted Regional Bike Network. We believe that this project could be completed in roughly five years if it was prioritized, as follows: -18 months for alignment definition and design                      -18 months for any necessary permitting, approvals, and right-of-way acquisition                      -24 months for construction</p> <p>AT074 – Coastal Rail Trail Oceanside Segment 1 ALT – According to the materials provided by SANDAG staff, this segment of the Coastal Rail Trail at the northern connection with the San Luis Rey River Trail would become just an on-street bike lane on Pacific Street, from just west of the railroad tracks underpass to west of the Oceanside Transit Center. This alternative does not appear to take advantage of the currently-built off-street segment adjacent to the tracks from under I-5 to Neptune Way (see photo). Why not incorporate that portion as part of this segment before returning to on-street status?</p> <p>AT113 – San Luis Rey River Trail Extension – This project proposes to extend the east end of the San Luis Rey River Trail from where it returns to surface streets at Andrew Jackson Street near Polk Street, all the way out to Old Hwy 395, mostly adjacent to the river. It should be noted that the proposed alignment does not make use of the already-constructed segment from Tyler Street to Via Manos at Hwy 76. In addition, there may also be City easements along the farmland adjacent to Highway 76, leading from Via Manos to the next neighborhood to the east. There, another already-constructed trail segment circumnavigates the residential neighborhood, coming out right across the street from Mission Vista High School on Melrose. All of these segments, if linked together, offer the opportunity to create a significant trail extension in the near future at very little cost. We urge SANDAG to consult with long-term Bicycle and Pedestrian Committee members who have extensive historical background on trails in this area.</p> <p>Additional Proposed Project#1 - SANDAG should consider an improved connection between the Vista Way shopping area east of I-5 and the Oceanside communities west of I-5. Currently, due to the topography of the alternative East/West routes, the freeway is a significant barrier to this community having access to the large shopping area on Vista Way east of I-5. Riding from the shopping center, west to the coast, requires riding up a very steep hill at the back of the shopping center and another one on Cassidy Street. They are both difficult climbs, especially with groceries. Such a project would likely entail a bridge overpass of I-5, in the vicinity of Kelly Street. Travelling East, once the Active Transportation user is past I-5, the optimum route would probably follow the least-elevation-change path, which would entail a turn to the south. We found that there is a similar bridge in Cupertino, over I-280, on Mary Avenue, that cost only \$8 million, approximately 13 years ago.</p>	

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Additional Proposed Project #2 - SANDAG should consider the Oceanside Coast Highway Corridor Study Road Diet and Incentive Zone, as approved by Oceanside in August 2019 between Harbor Drive and Morse, to be an Active Transportation Project. The project would convert this portion of the road, which is now mostly avoided by the Active Transportation Community, to be one that is safe and desirable. This “complete street” transformation would provide more room on the road for all roadway users, fewer signalized intersections, and reduced speeds. It would maintain good traffic flow, by having roundabouts at most arterials and a turning lane for streets and driveways between arterials. It would have a desirable mixed-use, smart-growth ambiance, with designated bike lanes, wider sidewalks, community-oriented commercial developments, upscale housing, and shade trees. This project is on the historical Route 101. The street is two blocks East of the Oceanside Transit Center, where new developments are planned. The City Library, a Community Center, and City Hall are on this street, just blocks from the Transit Center. The Bicycle and Pedestrian Committee has been urging Oceanside to expand its Climate Action Plan (CAP) by giving its City employees a car-parking system that encourages use of alternative modes to driving alone. This complete street project would help City employees get to work without driving.</p>	
<p><b>Peace Resource Center of San Diego</b></p>		
L235	<p>The PRC Board of Directors agrees that all San Diegans should have access to safe high-quality transportation and economic mobility. After consultation with our partner organizations and members, we submit the following recommendations to improve mass transportation to meet the needs of all our residents in the region. These recommendations also support our critical task of reducing carbon emissions.</p> <p>PRC Recommendations for amendments and changes to Appendix A of the 2021 Regional Plan:</p> <p>A. Prioritize funding to institute no-cost transit passes for youth ages 24 and under when Transit Fare Subsidies are allocated.</p> <p>Many of our members have children dependent on mass transit. No-cost transit passes for all youth encourages a culture of lifelong transit riders independent of cars. As part of a long-term strategy to build a greener and equitable San Diego, invest in youth no-cost transit passes. This and subsidies for elder travel will also stimulate the region’s equitable economic recovery. This works in other cities, and it is time San Diego MTS offers youth passes to connect our youth to our region.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
L236	<p>B. The proposed RTP will only achieve a 20% reduction in GHGs by 2035. San Diego needs a climate plan which exceeds this, and strives for 30% reduction. The overall system must live up to the promise to give a public transportation alternative that is as fast or faster, and less expensive, than private automobiles. There is concern that the proposed RTP will fall short of this promise.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. The SB 375 reduction target must be achieved by reducing per capita VMT.</p> <p>The 5 Big Moves will enhance connectivity and result in people having more travel options and operating solutions, reducing per capita VMT. Local jurisdictions can and will identify GHG reduction targets and measures to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
L237	<p>The lack of transit coverage of the “last mile traveled” is a large problem for both riders and our Climate. This is especially an issue for transit-dependent seniors who shop by bus in East County. Aggressive implementation of “flexible fleets” at the neighborhood/community level is vital, especially to achieve transportation equity. In addition, buses need more space for bags to ensure that transit riders can shop &amp; ride! Why aren’t shelves also put above the seats, allowing for more storage area of shopping bags, etc.</p>	<p>The deployment of Flexible Fleets such as e-bikes, shuttles, or ridesharing is envisioned as part of the 2021 Regional Plan to provide convenient and affordable options in different communities. SANDAG is developing a Flexible Fleet Implementation Strategic Plan to identify near-term opportunities for Flexible Fleet pilots that support mobility, equity, and sustainability goals.</p>
L238	<p>C. Ensure public safety of all passengers through community oversight of security training and reduce aggressive policing at transit stops.</p> <p>Ensure appropriate training of transit security - whether private or in partnership with local law enforcement. The training must include restorative practices as practiced by the county law enforcement, de-escalation tactics and bias-recognition studies. Members of the PRC Board have witnessed unacceptable targeting by transit security of young people, young women, people without housing, young men of color, and other residents. These interactions too often result in fines and/or arrests. They are terrifying for all who watch these aggressive tactics. Involve community groups in oversight of transit security training.</p> <p>Remove the practice of the infamous Lemon Stops from transit security practices. The Lemon Drop is when a team of local law enforcement from different agencies sweep through transit stops, using intimidation and illegal detention of people for questioning based on bias.</p>	<p>SANDAG, MTS, and NCTD believe that more can be done to improve the safety on and near transit and are working to make those improvements now and in the future. For example, funding at MTS for security is being diverted from fare enforcement to safety improvements.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>In addition, the Green Line frequently ends trips at Gillespie Field without warning. MTS claims this is due to schedule needs, if the trolley is running later than expected. Too often, women are told to leave the trolley at Gillespie, a deserted un-patrolled transit stop in El Cajon. This can result in dangerous encounters, especially in the evening. Plans should include longer trips during rush hour and later, to stop this practice of leaving people on a platform with no services or security.</p>	
L239	<p>D. The PRC supports the Recommendations from the Transportation Equity Working Group:</p> <ol style="list-style-type: none"> <li>1. An Environmental Justice Centered RTP</li> <li>2. Improve the Bus System Now: Develop a bus system that is fast, frequent, reliable, and accessible by increasing frequency on popular lines, especially overcrowded ones. More clarity in Appendix A: Transportation Projects, Programs, and Phasing that provides a list of specific improvements to the bus system. Bus improvements are one of the most affordable ways to immediately increase connectivity, reduce toxic air pollution and greenhouse gas (GHGs) emissions in the region.  At the same time, SANDAG must stop approving freeway expansions and also charge for “full cost of parking”. Too often, parking is subsidized by either private or public entities, a perk for car owners who don’t have to pay the full price of parking. History has shown that dependence on individual cars only leads to continued congestion. Solutions to congestion must be through public transit (rails, bus) and transit-housing hubs so that people who need transit can get to it easily. Focus on transit, affordable housing near transit centers. We must reduce VMT to have a decided impact/reduction on climate gas emissions.</li> <li>3. Blue Line Express: Fund the planning, environmental, engineering, and capital for the additional Blue Line track that allows express, 24-hour service, and additional frequency enhancements. Rail-grade separations should only move forward with the addition of a third track that eliminates conflict between the Blue Line and freight. The information listed needs to be clarified. It is unclear if the double/third tracking included in Appendix A refers to an additional track that will provide express connectivity from the border to downtown San Diego.</li> <li>4. 24-Hour Service by 2025: Provide 24-hour service on popular transit routes to connect late night and early morning workers to their jobs by 2025. Participants of the Elevate SD 2020 community engagement efforts ranked this as their highest priority. The information listed needs to be clarified. Appendix A includes local bus route enhanced frequencies to ten minutes in key corridors but does not state if that would result in 24-hour service. Simultaneously, Chapter 2 includes all-day services from 20-22 hours per day for rail and rapids, but it excludes local bus routes and a clear implementation schedule.</li> <li>5. Purple Line Serves Central City Heights: Fund the planning, environmental, engineering, and capital for the Purple Line as a rail line that connects EJ communities in central City Heights and South Bay to Sorrento Valley.</li> <li>7. Electrify Bus Fleet by 2030: Fund the implementation of California’s Innovative Clean Transit rule to accelerate the electrification of the bus fleet ten years before mandated by the California Air Resources Board.</li> <li>8. Identify Anti-Displacement strategies: Fund anti-displacement efforts to protect vulnerable communities living near transit corridors by developing an anti-displacement strategy that includes affordable/low-income housing and preservation of naturally occurring existing affordable housing, community ownership, and tenant protections.</li> <li>9. Bathroom network much needed!!! Develop a bathroom access plan and provide MTS with funding for a clean and accessible bathroom network open at all major transit stations. State-of-the-art bathrooms are mobility and key to a successful transit system.</li> <li>10. Emergency Ready Transit System: Fund the planning and implementation of a transit emergency response strategy to provide safety particularly to EJ communities during community-wide emergencies. EJ residents are more likely to live in proximity to hazardous land uses that frequently result in fires and neighborhood emergencies. Simultaneously, frontline communities are also most vulnerable in the face of climate disasters.</li> </ol>	<ol style="list-style-type: none"> <li>1. The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.</li> <li>2. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. The 2021 Regional Plan is not proposing any new highway expansions or addition of highway general purpose lanes but rather is focusing on a regional network of managed lanes that uses existing infrastructure by converting shoulders or general purpose lanes. In regard to parking management, SANDAG is looking into various parking and curb management strategies to encourage alternative modes of travel, including parking/curb pricing and reduced parking requirements.</li> <li>3. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</li> <li>4. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</li> <li>5. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</li> <li>7. The proposed final 2021 Regional Plan supports the electrification of the region’s transit buses and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</li> <li>8. Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan.</li> </ol>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>The PRC joins with our partners to urge you to take bold action to build a greener, healthier, prosperous, and just future in San Diego.</p> <p>Please amend the Plan to include Youth Opportunity passes as a priority.</p> <p>Thank you, and please feel free to contact us to discuss any of the recommendations outlined above.</p>	<p>SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p> <p>9. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p> <p>10. MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.</p> <p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
<b>Philip R. Kern</b>		
L240	<p>The 2021 Regional Plan is a significant departure from previous approaches in several regards, principally that it would be exorbitantly expensive to the region at a cost \$163B should it be implemented. By way of illustration, every one of the 3.3M residents of San Diego County in 2016 could be provided with a \$49,000 electric vehicle for less cost than implementing the proposed Regional Plan, without even allowing for tax incentives.</p>	<p>This line of thinking is shortsighted. While the distribution of electric vehicles (if possible) would generate short-term benefits, it would not address long term transportation needs. The Regional Plan invests in lasting transportation projects that will serve existing populations and the generations that will follow.</p>
L241	<p>Also by way of comparison, the entire Transnet program will generate \$15B through the 40 year life of the program from 2008-2048, less than 10% of the cost of the proposed 2021 Regional Plan.</p>	<p>The Regional Plan relies on over 30 sources of revenues, not just <i>TransNet</i>.</p>
L242	<p>The funding model for the 2021 Regional Plan is also a departure from previous efforts. Where in the past a transportation charges returned a defined benefit (i.e. improved roadway maintenance or the privilege of driving in a less congested Managed Lane), no such pretense is offered with this cost model. Per mile VMT “user fees” (which could be considered by many as taxes or penalties on autos) charged to use a private vehicle on a public roadway are mostly diverted to transit improvements, operations, maintenance, subsidies, and other programs rather than returned to the user in the form of a benefit. Many will view area roadways as bought and paid for with their and their parent’s tax dollars, not as a government-owned resource carrying a toll to be charged back to motorists. Given that the gas tax will not only remain, but most likely escalate, and be piled on to other fees and taxes, including VMT costs passed through by companies transporting daily goods, the situation does not promote equity or provide affordability to San Diego’s working families.</p>	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system. The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, and fair to all.</p>
L243	<p>The track record of SANDAG and its partners (principally Caltrans, MTS and NCTD) in delivering major transportation programs for the San Diego region within budget and on schedule has not been stellar, particularly when transparency on the real costs of the programs is factored into the equation. MTS’ Mission Valley East Trolley Extension (or “Green Line”) was pushing 50% over the original budget (\$361M vs. \$506M) and even that did not approach inclusion of all the</p>	<p>The Mid-Coast Trolley project is being delivered on time and within budget. More details of the project can be found here:  <a href="https://www.keepsandiegomoving.com/Mid-coast/midcoast-intro.aspx">https://www.keepsandiegomoving.com/Mid-coast/midcoast-intro.aspx</a></p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>costs required for the expansion of the system. Although delivery methods, and consequently cost and risk management, appear to have improved with the Mid-Coast Trolley Extension, no easily accessible “dashboard” or other record of construction Contract Change Orders could be found on SANDAG’s website for the project.</p>	
L244	<p>Several other major programs that were supposed to be included in the original Transnet authorization (extensions of State Route 76 and State Route 52, for example) were delayed over a decade with the commensurate increases in cost of the programs, traffic congestion, delays and emissions. The same pattern of deferring promised capital projects (particularly roadways) ad infinitum appears to be repeated in the 2021 Regional Plan. Assuming adoption of the Regional Plan by 2025 it appears highly unlikely given previous efforts that environmental, design and construction for any of the major transportation programs will be completed and ready for revenue service by 2035. Very few, if any, major local highway or transit projects in the region have gone from inception to ribbon cutting in a decade. The Mid Coast Trolley extension will end up taking over twenty years from inception to revenue operations. Accountability in this area is a serious issue.</p>	<p>This Regional Plan has been developed to prioritize different goals from previous efforts in order to provide a faster, fairer, and cleaner transportation system. The Managed Lanes system envisioned will help provide access to alternative modes, not facilitate boundless solo vehicle travel.</p>
L245	<p>The single most costly element of the 2021 Regional Plan is the proposed “high speed rail” (HSR) network. Aligning local high speed rail (HSR) facilities underground is not a panacea for avoiding environmental, right of way, utility, acquisition, and relocation costs related to development of a high speed transit network, nor will relying on tunneling technologies that are yet to be developed (and which may ultimately be proprietary) substantially reduce the risk or cost, or automatically render an economically infeasible transportation system more feasible once it goes underground. Tunneled alignments carry a whole new set of risks and costs, all of which come in to play when you elect to use the earth as a structure supporting your transportation system or the infrastructure above it. Fire and life safety, geologic conditions, surficial settlement, faulting/seismicity, HVAC needs, groundwater, subsurface environmental conditions, and other factors all have the ability to exponentially increase the cost and risk of below grade facilities, as well as kill the project outright. Proposing an underground (and under water) alignment parallel to the eastern shore of San Diego Bay under unstable Bay Mud, with the specter of future sea level rise and across a fault zone would range from ill-advised to sheer lunacy.</p> <p>Elon Musk’s The Boring Company (TBC) estimates current tunnel costs can range from \$100M to \$1B per mile. Their ultimate goal is to reduce costs to 10% of the low-end figure, or \$10M per mile, to be truly feasible on a large scale and today they are not even close to approaching that figure. TBC recently complete a 1.7 mile “bare” tunnel (no vehicles, track or infrastructure) in the sandy soils under the Las Vegas Convention Center at a cost of \$52.5M, or over \$30M per mile.</p> <p>The cost of a fully functioning surface high speed rail system including track, systems, vehicles, stations and support facilities can be expected to be at least \$200M per mile in</p> <p>2020 dollars, not allowing for more expensive tunneled alignments. The best data points are recently constructed and nearly completed projects, including Mission Valley East and Mid-Coast Trolley extensions. Published per mile costs for several recent programs in the western U.S. are shown in the table below, confirming the roughly \$200M per mile plus escalation is the going rate for a high speed, grade separated, electrified surface rail system in an urban setting.</p>	<p>The costs for the Commuter Rail include not only tunnel construction costs, but track and guideway construction, professional services, environmental, mitigation, right-of-way, and a 30% contingency on top of everything.</p>
L246	<p>A major factor in the selection of underground alignments will be the availability of expertise and resources with the San Diego region to prosecute a large-scale tunneling program. With the exception of a very short section of “real” tunnel (as opposed to a “cut and cover’ installation) on MTS’ Green Line, regional design and construction experience/expertise on passenger-carrying tunnels is essentially non-existent.</p> <p>Importing consultants and contractors is always an option, but never a good one as it does little for local hiring and talent development, or the ability to favorably negotiate contracts on behalf of the region when there is only one game in town (or worse yet, coming in from out of town). Decades of experience have been developed in the region developing the LRT system, this needs to be leveraged in a local High Speed Rail program.</p>	<p>To the extent possible, local expertise will be used, however, national and international expertise may be needed for the planning and engineering. SANDAG is committed to using local labor as much as possible</p>
L247	<p>Another question mark in the development of the Regional Plan is that the proposed high speed rail alignments generally parallel existing transportation corridors (whether you are talking freeways or LRT) but propose entirely new alignments. This is the worst of both worlds. It is far less expensive to increase capacity by (re)constructing new facilities within existing transportation corridors than by pioneering new alignments. New alignments require connecting infrastructure to be reconstructed and have the potential to introduce new environmental impacts (and mitigation) to areas not previously exposed to transportation activities, which also factors into the environmental justice arena. The entire San Diego Trolley system could be reconstructed as a high(er) speed rail system for a fraction of the cost of a new underground HSR system with the bonus that the same vehicles could be used regionally to phase out the diesel powered DMUs used on the Sprinter. Trolleys can run at 55 mph, how fast do you want to go? On modern transit systems travel time is dictated more by the number of stops rather than the top speed of the vehicles.</p>	<p>All services included in the Regional Plan include operations and maintenance assumptions, including the cost to purchase transit vehicles.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Also, to be fair and transparent to the region, the costs for the local HSR and other systems need to account for all costs attributable to the development of the system, rather than the classic “just get program past the point of no return, then they will have to pay for it” approach. In addition to trackways, systems, vehicles, modifications to the existing system and other capital costs, the program needs to account for such esoteric items as new maintenance shop space, technicians, and training as well as specialized equipment required to operate and maintain the new rail vehicles. Adding yet another type of transit vehicle requiring its own maintenance infrastructure to the regional fleet would be violating the first rule of fleet management: maximize commonality.</p> <p>The “per-mile costs” outlined above should also serve as a yardstick to determine the financial feasibility of the system at a glance, i.e. if you cannot deliver a transportation network by 2050 for less than \$500M per mile (\$200M per mile escalated 30 years at 3%), you need to seriously consider other alternatives. At costs exceeding \$500M per mile the 2021 Regional Plan proposal does not pass the “sniff test” on the high speed rail issue. The planners need to go back to the drawing board on this element to provide better alternatives.</p>	
<b>Quality of Life Coalition</b>		
L248	<p>To secure a healthy, safe, and equitable future, SANDAG must embrace an outcomes-driven RTP and identify priority outcomes aligned with those values. Below are seven key outcomes the Quality of Life Coalition urges SANDAG to prioritize in the 2021 Regional Transportation Plan:</p> <p>1. Improve public health in disadvantaged communities and prioritize transportation and environmental justice by:</p> <ul style="list-style-type: none"> <li>• Reducing transportation related pollution levels in disadvantaged communities.</li> <li>➤ AB 805 requires SANDAG to identify which communities to prioritize in their efforts to reduce pollution levels in this RTP.</li> <li>➤ SANDAG must use CalEnviroScreen 3.0 to identify these communities; we recommend defining disadvantaged communities as those in the top 30% of census tracts countywide, but also acknowledge that there are historically underinvested communities in San Diego County that are not adequately represented on this tool.</li> <li>➤ Any new transportation vision that successfully reduces pollution levels in disadvantaged communities must include significant reduction in Vehicle Miles Traveled (VMT) and rapid electrification of the bus fleet.</li> </ul>	<p>The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. To make this information more accessible, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. The AB 805 analysis included communities ranking in the top 25% of CalEnviroScreen 3.0 scores and an additional analysis for the top 50% scoring census tracts with the understanding that there are communities in the region with varying levels of vulnerability. The 2021 Regional Plan significantly reduces per capita VMT, however, total VMT increases through the life of the plan at a slower rate than population growth. Electric vehicle programs in the plan include investment in zero emission buses and associated charging/fueling infrastructure.</p>
L249	<ul style="list-style-type: none"> <li>• Providing infrastructure that: <ul style="list-style-type: none"> <li>➤ Encourages increased physical activity from active transportation</li> <li>➤ Reduces the risk of traffic related fatalities and injuries for all modes</li> </ul> </li> <li>• Analyzing health outcomes that are affected by the regional transportation system in each alternative, such as asthma, cardiovascular and pulmonary disease, lung cancer, type 2 diabetes, physical activity and obesity rates, by demographic group.</li> </ul>	<p>Response: The 2021 Regional Plan includes investments in the Regional Bike Network, complete streets in mobility hubs, and a Vision Zero program to fund grants and technical resources for local jurisdictions to pursue Vision Zero.</p> <p>Section 4.3 of the Draft EIR addresses the impacts of the 2021 Regional Plan on Air Quality. The EIR analyzes the exposure of sensitive receptors to toxic air contaminants (TACs) and the health risks of both cancer and noncancer hazards.</p>
L250	<p>2. Align with and exceed cities’ CAP transportation mode shift targets.</p> <ul style="list-style-type: none"> <li>• SANDAG’s plan needs to support those local plans in order for our cities to be able to hit their targets and support transportation alternatives to driving, such as mass transit.</li> <li>• Further, AB 805 – the new state law to reform SANDAG – requires that SANDAG align the RTP with local climate action plans.</li> </ul>	<p>The 2021 Regional Plan (Appendices A and B) contains Supporting Policies and Programs to support local climate action planning. Over one billion dollars is envisioned to go towards programs to support climate action planning, provide climate adaption and resilience, and promote electric vehicles and infrastructure (see Table A.17 of the Appendix A). The GHG Section 4.8 of the Draft EIR documents how the 2021 Regional Plan is consistent with local climate action plans and identifies specific investments as mitigation, including a new Climate Action Plan grant program.</p>
L251	<p>3. Achieve a 30% or more per capita GHG reduction from transportation by 2035.</p> <ul style="list-style-type: none"> <li>• SB 375 requires a minimum of 19% reduction by 2035; however, SANDAG Executive Director Hasan Ikhata has identified a 30% target as feasible, and SANDAG should pursue the maximum feasible reduction to adequately address the threat of climate change.</li> <li>• VMT reduction and mode shift through land use, housing, and transportation planning decisions must play a significant role in GHG reduction.</li> <li>• As evidenced by Governor Brown’s Executive Order B-55-18 to Achieve Carbon Neutrality by 2045, and SB 32 and EO S-3-05, which set statewide emissions reductions targets at 40% below 1990 levels by 2030 and 80% below 1990 levels by</li> </ul>	<p>The 2021 Regional Plan exceeds the SB 375 target of 19% reductions of per capita GHG by 2035 and the Board of Directors Resolution goal of a 30% reduction of GHG emissions from all on-road transportation by 2035. Please see Section 4.8 of the Draft EIR for analysis and discussion of the Plan’s effect on GHG emissions. Section 4.4 of the Draft EIR analyzes the 2021 Regional Plan’s consistency with state climate goals. It also includes Mitigation Measure GHG-5c, which calls for SANDAG to implement a nature-based climate solutions program to increase rates of carbon sequestration.</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>2050, the State of California continues to move towards decarbonization. SANDAG should align with these statewide goals in the next RTP.</p> <ul style="list-style-type: none"> <li>• When vegetation is destroyed for transportation facilities the resulting loss of carbon sequestration and storage capability should be counted as a loss in future GHG reduction tabulations.</li> </ul>	
L252	<p>4. Create a rate structure that increases ridership and expands access to mobility.</p> <ul style="list-style-type: none"> <li>• The regional transportation system must include Youth Opportunity Passes, which are no-cost transit passes for students and youth 24 years old and under.</li> <li>• It must also include strategically-priced fares that maximize transit usage in all income brackets to increase use of public transit, improve public health, lower greenhouse gas emissions, and enhance social equity.</li> <li>• Finally, it must be easier for seniors, people with disabilities, and Medicare users to obtain the discounted passes they are entitled to by making them available online and at more in-person sites.</li> </ul>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
L253	<p>5. Ensure that public transit is safe, comfortable, convenient and competitive with automobile travel.</p> <ul style="list-style-type: none"> <li>• Public transit must be competitive with driving in terms of time, cost, predictability, and convenience.</li> <li>• Prioritize urban core and transit-dependent communities, who are frequently low-income communities of color.</li> <li>• Provide 24-hour service and immediate improvements to bus service, including amenities such as restrooms at transit stations.</li> <li>• Ensure safe and comfortable bike and pedestrian first and last mile access to transit through funded, comprehensive, low-stress bikeway networks connected to mobility hubs, as well as adequate accommodation for bicycles on transit.</li> <li>• Prioritize new rail transit that connects underserved communities with job centers such as the blue line express and a purple line alignment through City Heights while evaluating the impacts on communities that are being displaced and gentrified.</li> <li>• Prioritize relocation of public transit corridors that are vulnerable to erosion and sea level rise, rather than armoring in place.</li> <li>• Ensure rural communities have access to quality, convenient, sustainable travel options that offer alternatives to fossil-fuel vehicles.</li> </ul>	<p>The 2021 Regional Plan proposes an expanded public transit network including commuter rail, light rail, Rapid bus, and local bus services. The network was developed to be a comfortable, convenient option to the automobile. The Regional Plan includes funding for amenities such as restrooms at new rail stations and a study to improve bathroom access for existing transit stations. Funding for complete streets in mobility hubs supports safe access for people biking and walking to transit. The commuter rail service connects the highest demand trip areas between residents and employment centers. The purple line alignment through City Heights is being studied in the South Bay to Sorrento Comprehensive Multimodal Corridor Plan currently underway. Funding for the relocation of rail on the Del Mar Bluffs to a tunnel is prioritized in the 2021 Regional Plan. The Plan includes investments in Flexible Fleets, expansion of broadband, investment in zero emission vehicles, and improvements on rural corridors. These benefit rural communities with improved access to mobility options via technology, increased safety on hazardous roads particularly during emergency situations, and advanced deployment of zero emission vehicles.</p>
L254	<p>6. Ensure transportation projects are creating high-quality careers in construction in our region through a Project Labor Agreement.</p> <ul style="list-style-type: none"> <li>• Major cities including Seattle and Los Angeles have employed project labor agreements to promote their commitment to labor stability, joint labor-management apprenticeship and a diverse, local workforce.</li> <li>• Encourage construction employment and training opportunities in ways calculated to mitigate the harms caused by geographically concentrated poverty and unemployment in economically disadvantaged areas and among disadvantaged workers.</li> <li>• Adopt a Community Workforce Policy that is implemented through a Project Labor Agreement with the Building Trades to create career pathways for a skilled and trained workforce for residents of our local communities.</li> </ul>	<p>Chapter 1 of the Regional Plan notes that AB 805 requires use of a skilled and trained workforce. In addition, on July 23, 2021, the SANDAG Board of Directors authorized staff to begin negotiations with the San Diego County Building and Construction Trades Council to execute a Community Benefits Agreement.</p>
L255	<p>7. Preserve Biodiversity, Natural Habitat, and Open Space</p> <ul style="list-style-type: none"> <li>• Ensure transportation projects protect the integrity and contribute to successful implementation of existing and planned multiple species conservation plans (MSCPs) including avoiding sensitive habitat areas within the City of San Diego’s Multi-Habitats Planning Area and County of San Diego’s Pre-Approved Mitigation Area and consistency with MSCPs rules.</li> <li>• Ensure transportation projects preserve natural habitat and other ecologically sensitive lands not covered by regional MSCPs including: urban canyons, waterways, waterbodies, ecological linkages, and ecologically important greenfields.</li> <li>• Direct transportation projects away from remote or rural natural lands and into existing developed communities and urban areas.</li> <li>• Ensure habitat mitigation land related to transportation projects is protected and managed for that ecological benefit.</li> </ul>	<p>The proposed land use pattern of the 2021 Regional Plan concentrates growth and development primarily in the mobility hub areas, which allows for preservation of open space and natural habitat in the San Diego region. Environmental mitigation funding for transportation projects is accounted for in the cost estimates of the Regional Plan. Section 4.4 of the Draft EIR discusses the impacts of the 2021 Regional Plan on biological resources, including the regional habitat conservation plans such as the MSCP. Mitigation has been identified to avoid and reduce biological resources’ impact on the future construction of transportation and land use projects.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
<b>Quality of Life Coalition: Karl A.</b>		
L257	“The 2021 Regional Plan reduces per capita GHG emissions from cars and light duty trucks to 20% below 2005 levels by 2035, exceeding the region’s state mandated target of 19%. The 2021 Regional Plan also meets federal air quality conformity requirements” - This means our 29 year plan is barely ambitious enough to meet our insufficient state mandate. SANDAG should independently acknowledge the need to act on climate instead of stating from the outset that they are mandated to do so, and therefore meet the bare minimum with no margin for error. Less than 2% change annually is in the realm of noise in measurement. We need more bold commitment to change.	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.
L258	Projected emissions from GHG of Natural Gas use doesn’t assume a reduction in use by 2050 but instead assumes unabated use. Appreciate that it’s pessimistic and not optimistic, but these numbers will be very inaccurate, given changes in building code for 2022. (Table X.16) Wanted to visualize the numbers from table X.3 better. Note that methane gas is the second highest contributor after 2025, and it becomes 20% of the emissions by 2050, with no expectations of abatement.	The methodology used to calculate GHG emissions from Natural Gas in Appendix X: 2016 Greenhouse Gas Emissions Inventory and Projections for the San Diego Region is based on the best available data, including building standards through the 2019 Edition of California Title 24. Without a CEC California Energy Demand Forecast beyond 2030, more conservative building codes were assumed so as to not overestimate reductions. Future changes in building standards and related forecasts will be incorporated into future emissions inventories and related natural gas calculations.
<b>Quality of Life Coalition: San Diego County Bicycle Coalition</b>		
L259	Several duplicate comments were submitted by the San Diego County Bicycle Coalition via the Quality of Life Coalition letter.	All comments from the San Diego County Bicycle Coalition included in the Quality of Life Coalition letter were also received directly from the San Diego County Bicycle Coalition. Comments and responses are provided under “San Diego County Bicycle Coalition.”
<b>Quality of Life Coalition: Sierra Club of San Diego</b>		
L260	The ever-increasing urgency to prevent a climate catastrophe demands fast action to reduce greenhouse gas emissions. One of the most significant ways to do that is to quickly reduce driving. In light of this, projects that fail to reduce vehicle miles traveled (VMT) must be deferred until the vehicle fleet has mostly been replaced by zero-emission vehicles. Otherwise well-intentioned projects like HOV to HOV connectors will actually increase VMT by reducing travel times, encouraging more people to drive and pay whatever fees are required to use the HOV lanes. Vehicles powered only by internal combustion engines must be banned from any form of managed lanes.	The 2021 Regional Plan proposed managed lanes network uses existing infrastructure by repurposing shoulders and general purpose lanes to offer priority access to transit, carpools, vanpools and low-emission vehicles with appropriate decals to achieve meeting state and federal greenhouse gas and air quality targets. The Regional Plan also supports investments in the electrification of cars, trucks and buses and their supporting infrastructure. Appendices A (Table A.17) and B address SANDAG’s proposed EV commitments. For light duty vehicles, SANDAG plans to invest \$45 million by 2025 and a total of \$270 million by 2050 for EV charging station incentives.
L261	There is no need to expand freeways when it is clear that driving must be reduced. Managed lanes must replace existing general purpose lanes. Adding lanes for any reason is unacceptable while driving is the largest source of GHG emissions.	The 2021 Regional Plan places emphasis on maximizing the use of existing facilities to add corridor capacity to ease congestion while also trying to achieve meeting state and federal greenhouse gas and air quality targets. The proposed managed lanes network uses existing infrastructure by repurposing shoulders and general purpose lanes to offer priority access to transit, carpools, vanpools and low-emission vehicles with appropriate decals. The system of managed lanes and supporting connectors support Transit Leap and high occupancy vehicles to create a seamless systemwide network that will provide people with transportation options, reducing the need to add new highways or general purpose lanes.
L262	Realignment of the LOSSAN segment through the University Community to a tunnel between Rose Canyon and Sorrento Valley would improve rail efficiency and travel times by avoiding Miramar Hill and would improve connections to other public transportation with a station at University Town Center. Realignment of the LOSSAN segment through Del Mar to a tunnel under Del Mar Heights between Sorrento Valley and the Del Mar Fairgrounds would also improve rail efficiency and travel times, improve public access to the coast, and accommodate managed retreat from eroding bluffs by avoiding the unsustainable current alignment on the delicate bluffs of Del Mar.  Sierra Club generally supports realignment of the two segments of the LOSSAN rail corridor to the extent that the new alignments and tunnels are located and constructed in a manner that fully minimizes impacts and maximizes preservation and restoration of natural habitat, open space, and wildlife corridors in Los Penasquitos and San Dieguito lagoons, Carroll Canyon, Crest Canyon, Rose Canyon, and Torrey Pines State Natural Reserve Extension.	Thank you for your support of these improvements to the LOSSAN rail corridor.
L263	Protect & restore Los Penasquitos & San Dieguito lagoons  · Realigned track across or near Los Penasquitos Lagoon should be located as close as possible to old Sorrento Valley Road and I-5 and, if located in the Lagoon, should be on an elevated bridge across the entire Lagoon to protect and maintain lagoon hydrology. An existing hill portion of Carmel Valley Road between Caminito Pointe Del Mar and Portofino Drive should be lowered as necessary to accomplish these goals.  · The Project should not impede tidal flow in Los Penasquitos or San Dieguito lagoons.	The 2021 Regional Plan includes major investments in the LOSSAN rail corridor. The San Dieguito Double Track and Special Events Platform project replaces a single track wooden trestle bridge with a new double track concrete bridge within existing NCTD right-of-way increasing tidal flow to wetlands. The Del Mar Tunnel project would include double tracking through the Los Penasquitos Lagoon in an alignment to be determined. Double tracking across that Los Penasquitos lagoon would be designed to increase tidal flow. The Del Mar Tunnel would undergo environmental review and permitting from the appropriate federal and state regulatory agencies.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L264	<p>· The Project should include maintenance of open Los Penasquitos and San Dieguito lagoon channels to the ocean.</p> <p>Remove old track infrastructure &amp; restore lagoons &amp; native habitats</p> <p>· Old track infrastructure should be fully removed and restored to wetlands, coastal bluff scrub, coastal sage scrub, and other location-appropriate native habitats and vegetation. Removal of old track infrastructure includes removal of all Del Mar bluff stabilization structures to allow for natural bluff erosion, removal of all berms and bridges across Los Penasquitos Lagoon, and removal of all tracks, berms, trenches, and retaining walls in Carroll and Rose Canyons[1] and in Sorrento Valley.</p> <p>· Fill soils in the berm across Los Penasquitos Lagoon may have originated from the Del Mar bluffs and should be returned and incorporated into restoration of the old track cut on the Del Mar bluffs if soils are appropriate.</p> <p>Protect and restore wildlife corridors</p> <p>· Realigned track should be below grade in a tunnel or covered trench capped with native vegetation to protect wildlife movement in and between the Crest Canyon Preserve and San Dieguito Lagoon.</p> <p>· Realigned track above Carmel Valley Creek and Carmel Valley Road should not restrict deer and other wildlife movement in and between Torrey Pines State Natural Reserve, Los Penasquitos Lagoon, and Carmel Valley (under I-5).</p> <p>· Realigned track should emerge in Sorrento valley from the tunnel under the University Community elevated on a bridge over Carroll Canyon Creek.</p> <p>· Old track infrastructure should be removed and berms and slopes should be recontoured and planted with native vegetation to restore a wildlife connection between MCAS Miramar and Carroll Canyon and Sorrento Valley.</p>	<p>The 2021 Regional Plan is a high-level, programmatic document. Specific details regarding impacts and mitigation are not known at this time but will be covered when these future projects go through project level environmental review.</p>
L265	<p>Establish a Del Mar bluffs park</p> <p>The old LOSSAN right-of-way on the Del Mar bluffs should include a linear park with a public walkway and connections to the beach. However, park and beach access infrastructure should not interfere with natural bluff erosion and managed retreat.</p>	<p>SANDAG recognizes a need to improve connectivity to the coastal resources in Del Mar. SANDAG, NCTD, and the City of Del Mar have partnered together to jointly conduct a planning study to identify coastal access connections along the Del Mar Bluffs. In the long term, NCTD is the owner of the railroad right-of-way and they will determine what to do with the space once the tracks are realigned in a tunnel.</p>
L266	<p>Protect existing preserves and open space</p> <p>Tunnel vents should not be located in Crest Canyon Preserve, Torrey Pines State Natural Reserve Extension, or any University Community open space.</p> <p>Control invasive non-native plants</p> <p>The Project should bar deliberate planting of invasive non-native plants and provide for long-term control of any colonizing invasive non-native plants.</p>	<p>The 2021 Regional Plan is a high-level, programmatic document. Specific details regarding impacts and mitigation are not known at this time but will be covered when these future projects go through project level environmental review.</p>
L267	<p>Retain and improve pedestrian and bicycle infrastructure</p> <p>The Project should retain and improve pedestrian and bicycle infrastructure and connections including between Sorrento Valley Road and Carmel Valley Road, the San Dieguito River Park Coast to Crest Trail, and between the Coast to Crest Trail and Crest Canyon.</p>	<p>The currently underway Coastal Connection Pedestrian Access Study is an opportunity to begin facilitating improved connections in this vicinity. Longer term, the Coastal Rail Trail Del Mar project (AT028) will be coordinated to create a significant corridor-level improvement for people walking, biking, or using other micromobility modes.</p>
L268	<p>Many of the Active Transportation projects listed are from the Early Action Plan that they adopted in 2013 and were supposed to be completed within 10 years. There was \$200 million allocated for these bikeways, most of which are yet to be fully built. I'd like to understand if this is new funding and the timing of when these projects that are already in the works are supposed to open. It seems a bit like double dipping and now the build date is 2025 at the earliest but some say 2035, which is unacceptable</p>	<p>The commitment by the SANDAG Board of Directors for the Early Action Program was a programmatic high-level budgeted dollar amount and was always intended to be supplemented, for example as a "match" for additional grant funding to fully complete this list of projects. Funding additionally comes from different sources and financing mechanisms, including the commercial paper bonding approved by the SANDAG Board of Directors in 2020. Of note, there is a near-term goal to increase the percent of <i>TransNet</i> funding committed to the Bicycle Pedestrian, and Neighborhood Safety (BPNS) portion of local funds, this is a consistent source for the EAP projects. The commitment to funding the EAP projects has been steadfast, and the 2021 Regional Plan reflects the latest estimates. The cost estimates were initially a planning-level determination for designing and building a specific number of projects with unit costs for infrastructure elements according to bikeway facility type. Construction costs (see Caltrans Cost Index) and specific bikeway facility types have been further refined in the planning, design, or construction phases for these specific</p>

ID	Comment	Response
		<p>projects and are highly variable, with many changes made since 2012 as the projects were refined through those phases.</p> <p>The date EAP bikeways will be Open to Public is specific to each project. There is significant mileage which is in the “No Build” phase, and the majority of EAP projects are estimated for opening within the 2025 phase. Additionally, the remaining EAP projects will be built sooner than 2035 but are simply aggregated into that 2035 “Phase Year” for the Appendix, consistent with other modes and presentation as a network for the table and maps.</p>
L269	I only see mention of the San Ysidro and Central Mobility Hub specifically. Is Table A.14 in reference to those or amenities for mobility hubs for all of the other new lines? We need a commitment to ensure transit accessibility for those on foot and bikes.	Table A.14 summarizes investments in Mobility Hub amenities and Flexible Fleet travel options across all 31 regional Mobility Hub areas as depicted on the map in Chapter 2, Figure 2.4. Given that planning has already commenced for Central Mobility Hub and San Ysidro communities, Transit Leap investment costs have been included as project-specific line items in Tables A.1 and A.2.
L270	Where is the habitat funding? We need a strong commitment to a regional funding source for habitat.	To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified \$2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a \$565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional \$300-\$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A).
L271	The Regional Plan must include a strong commitment to provide adequate funding for the Habitat Conservation Plans.	To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified \$2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a \$565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional \$300-\$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A).
<b>Quality of Life Coalition: Southwest Wetlands Interpretive Association</b>		
L272	Page 9. The brief description of this region’s natural resources, biodiversity, cultural history and other unique assets should be expanded and include a short description of the relationship of the regional transportation planning and multiple species conservation planning and permitting. This could be simply done by adding a short summary from Appendix AA.	Chapter 2 has been revised with this discussion.
L273	In the early 2000’s, SANDAG and the state/federal wildlife agencies entered into unique agreements linking regional conservation commitments with expedited transportation project permitting (and mitigation). How does this plan continue and support those agreements and commitments?	<p>Implementation of the proposed Plan would comply with the provisions of all approved local, regional, state, and federal regulations, policies, ordinances, and finalized conservation plans (HCP/NCCP, specifically the MSCP and MHCP and their respective subregional plans). In addition, the role of SANDAG as the regional planning agency and its commitment in its development of a Sustainable Communities Strategy will provide new opportunities to fulfill the promises made during the adoption of the region’s various regional habitat conservation plans.</p> <p>SANDAG, through its innovative EMP, has provided a successful stopgap measure to partially fill the regional funding needs over the last 15 years. However, the larger acquisitions under the EMP have been completed, and the EMP does not have the capacity to assist the region with all the necessary funding for management. SANDAG will need mitigation for impacts from future transportation projects outlined in the 2021 Regional Plan. This mitigation will allow those projects to move forward and will also help the region preserve wildlife species and their habitats; however, it does not replace the need for regional funding of the acquisition, management, and monitoring of lands as identified in the regional habitat conservation programs.</p>
L274	Page 13. Provide more description regarding how the anticipated increases in peak period transit use from 3% (2020) to 13% (2050) will result in a reduction in solo commuter vehicle use from 80% (2020) to 62% (2050); what are the expected contributions from other mode shifts required to achieve this goal? Add a summary table (or cross reference an existing table) that shows all mode shifts (carpool/rideshare, active transit, etc.) for 2025, 2035 and 2050. In addition, the plan’s performance metrics must include tracking of the (housing) density and transportation infrastructure improvements in smart growth areas as well as what actual/calculated GHG reductions are occurring compared to what was projected. Also briefly introduce and describe the plan’s adaptive management approach for triggering and implementing measures to correct failings in meeting the plan’s goals.	Detailed mode shift performance data is documented in Appendix T. Tracking of the share of new housing units in smart growth areas is included in the list of Performance Indicators for the 2021 Regional Plan (Table 3.1). Priority Implementation Action #10 is to advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery. SANDAG will be implementing the 2021 Regional Plan, monitoring performance, and updating the plan every four years to incorporate the latest data, policies, and incorporate corrective measures.
L275	Page 13. The plan states that it is expected to exceed the current vehicle-based per capita GHG emissions requirement for 2035, but as annotated in the list of state GHG emission reduction legislation/executive orders on Page 14, aggressive	The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	overall GHG emission reduction targets have been established for 2030, 2040 and 2050. Provide explanation of how the plan will continue to contribute to reducing vehicle per capita (and overall) GHG emissions to complement the overall GHG emission reduction goals after the 2035 target date. [As noted in our comment on Appendix D (Page D-4), the plan's post-2035 contribution to reducing GHG emissions remains flat after 2035, implying that the current measures will not contribute substantially to those higher GHG emission reduction targets.	Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. As described in Chapter 2, implementing the 2021 Regional Plan, while also facilitating the development and implementation of local climate action plans across the region will help the State, SANDAG, cities, and other public agencies achieve their climate goals.
L276	Page 23. The plan states that, to the extent feasible, it will stay within rights-of-way to minimize impacts and would produce other environmental benefits (water quality, air quality, reduced flooding, etc.). How does the infrastructure system that is proposed in the 5 Big Moves compare to the transportation infrastructure system that was anticipated in 2004 when the original RTP and MSCP agreements were established?	While a majority of <i>TransNet</i> extension ordinance projects have been started or built, there are projects that remain on the <i>TransNet</i> extension list of projects that are being reimagined in the 2021 Regional Plan as part of a regionwide system. These are detailed in a report to the <i>TransNet</i> Independent Taxpayer Oversight Committee on July 7, 2021: <a href="https://www.sandag.org/index.asp?meetingID=5886&amp;fuseaction=meetings.detail">https://www.sandag.org/index.asp?meetingID=5886&amp;fuseaction=meetings.detail</a> .
L277	More specifically, because SANDAG agreed to mitigate (and has mitigated?) for expected upland and wetland habitat impacts in advance of projects impacts – based on a previous set of projects/infrastructure, will the new infrastructure have new impacts that are beyond or not mitigated by the previous agreements? For example, adding many connectors among the freeways and expanding some state routes could directly and indirectly impact habitat and wildlife corridors in excess of what was anticipated in the initial agreements. If so, how will the plan ensure no net losses of habitat acres, functions and values (including to movement corridors)?	Near-term Action 3a is to update <i>TransNet</i> ordinance and associated Board policies to reflect projects and priorities included in the 2021 Regional Plan. The <i>TransNet</i> Environmental Mitigation Program will be evaluated as this action is implemented and these questions will be considered in that process. In response to this comment, a study related to EMP has been added under action 9a.  For direct and indirect impacts related to biological resources for projects within the 2021 Regional Plan, refer to Section 4.4 Biological Resources of the EIR.
L278	Page 25. The plan has the potential to produce and encourage environmental benefits (climate change mitigation, air and water quality improvements) as summarized in this section. Include more discussion about the plan's commitments to meet or improve upon the longstanding habitat and conservation agreements (e.g., NCCP/HCP permits), avoid new/unpermitted impacts to habitat/species, and mitigate for any significant unavoidable impacts.	Chapter 2 has been revised with this discussion. In addition, Appendix AA also includes discussion of environmental benefits of SANDAG's Nature-Based Climate Solutions Program that will promote natural infrastructure that uses or mimics natural processes to benefit people and wildlife. SANDAG will prioritize resilience and innovative solutions in transportation infrastructure, Comprehensive Multimodal Corridor Plans, and consistent regional planning and implementation of the Sustainable Communities Strategy actions, emphasizing both nature-based and technological climate solutions. There are also further opportunities to expand upon ongoing efforts to assess the amount of carbon storage and sequestration potential of open space lands and the co-benefits from preserved open space, land management, and restoration activities.
L279	Page 27. To assist the public's understanding of the essence of the plan, add several figures to show the relationships (by time period) among transportation infrastructure, mobility hubs, and smart growth/increased housing density areas). More specifically, provide a set of diagrams to illustrate – at the system/regionwide perspective - which projects are to be completed by 2025, 2035, and 2050 and which mobility hub/ Smart Growth areas they serve. Because Smart Growth areas are expected to increase their housing densities, the plan must provide justifications and demonstrable commitments (e.g., policies, funding, incentives) that support the presumptions that the cities and county will make those density increases in step with the basic transportation improvements (transit leap, active transportation, mobility hubs, complete corridors).	Appendix A includes detailed maps for transportation projects planned for during each phase of the 2021 Regional Plan. Appendix F includes figures demonstrating areas for future growth. In addition, SANDAG has made this information available in its online data viewer: <a href="http://www.sdforward.com/envision">www.sdforward.com/envision</a> .
L280	Previously, SANDAG produced a short list/explanation of its incentives for smart growth ( <a href="https://www.sandag.org/uploads/publicationid/publicationid_1187_5188.pdf">https://www.sandag.org/uploads/publicationid/publicationid_1187_5188.pdf</a> ), but it is unclear how effective those incentives have been. How does the plan improve on those incentives?	Information on effectiveness of the smart growth incentive program is available online: <a href="https://keepsandiegomoving.com/SmartGrowth/smartgrowth-intro.aspx">https://keepsandiegomoving.com/SmartGrowth/smartgrowth-intro.aspx</a> .  The 2021 Regional Plan includes action 8b to update evaluation criteria and provisions of SANDAG grant programs.
L281	Page 31. Goods movement comprises a relatively small part of the region's GHG emissions (Appendix X), but its associated on-road use by heavy trucks and allied freight rail access/rail car storage – especially through/near disadvantaged communities and the Port District terminals – creates significant impacts to local transportation, air quality and quality of life. The RTP/SCSs transportation infrastructure system improvements must be fully integrated with the Port's implementation of its proposed maritime operations strategy and additional actions to relocate (to the extent feasible) truck parking and freight rail car storage away from the coastal area.	SANDAG collaborated with the Port of San Diego (Port) on the strategies identified in the 2021 Regional Plan and will continue to partner with the Port on implementing these projects. SANDAG is also working with partner agencies and local communities to ensure that projects identified in the Assembly Bill 617 Portside Environmental Justice Neighborhoods Community Emission Reduction Plan and the Port's Maritime Clean Air Strategy are implemented. SANDAG also recently signed a memorandum of understanding with the Port and Caltrans to coordinate closely on implementing projects near the Port's Working Waterfront that improve accessibility, sustainability, economic vitality, and community health.
L282	Pages 32-33. The essence of the plan's sustainable communities strategy is expressed in the introduction to the region's growth and development: "The 2021 Regional Plan envisions a regional pattern of growth and development that reflects smart growth, transit-oriented development, preserving natural resources, and building communities that are resilient to the consequences of climate change and other environmental changes. Ensuring social equity and the availability of housing that is affordable for everyone are also top priorities." Those goals will only be achieved when the cities and county, which constitute SANDAG, fully acknowledge the necessity to amend their general plans to accommodate and implement the identified changes.  The forecasted concentration of jobs and housing (and population) in the urban areas that are necessary to implement	While land use authority is reserved for local jurisdictions, SANDAG will work closely with local jurisdictions to implement the land use pattern proposed in the 2021 Regional Plan. Near-term and continuing actions listed under Priority Implementation Action 8 related to land use include: 8b) update evaluation criteria and provisions of SANDAG grant programs to encourage planning and capital projects that allow for high-density and mixed-use development within Mobility areas and/or transit priority areas; 8c) launch a regional housing incentive grant program to fund local plan updates in Mobility Hub areas that can lead to more housing in transit-rich areas with infrastructure, services, and jobs; and 8h) utilize the intergovernmental review process to evaluate consistency of development projects with the Sustainable Communities Strategy.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>the plan would create a more efficient, livable region that supports the proposed transportation system. It would also alleviate pressure for development in the unincorporated county, reduce impacts on the natural landscape, and lessen the risks from wildfire to people and structures.</p> <p>If the plan is approved, then how are the cities and county proposing to commit to implement those changes? What ramifications are there to the plan – and for a jurisdiction’s ability to benefit from the transportation system improvements – if a jurisdiction does not make those needed general plan changes?</p>	
L283	<p>Pages 34-35. The global threat from continued GHG emissions and unique threats, conditions, and opportunities to reduce GHGs within our region are recognized in this plan. The GHG inventory and calculation of anticipated reductions by sector illustrate how the plan would be able to meet and exceed the region’s SB 375 GHG emission reduction target for 2035. As noted in preceding comments, achieving that goal requires significant cooperation from each of SANDAGs member jurisdictions through changes to their general plans (especially land use/zoning) as well as how their Climate Action Plans support and augment the RTP/SCS.</p> <p>While this plan demonstrates that it could meet/exceed the mandated GHG emission reduction target for 2035, the projected emissions out to 2050 in Appendix X suggest that the region will be far from “carbon neutrality by 2045.” That is not a region-by-region requirement, but it is critical that this plan incorporate goals and policies - and at least propose possible actions/projects – that would put the region on a more aggressive GHG emission reductions pathway post-2035.</p>	<p>Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. As described in Chapter 2, implementing the 2021 Regional Plan, while also facilitating the development and implementation of local climate action plans across the region will help the State, SANDAG, cities, and other public agencies achieve their climate goals.</p>
L284	<p>Decisions pertaining to which and when to initiate projects should balance the basic GHG emission reduction priority and their effectiveness in promoting the more broad actions (i.e., specific local jurisdiction actions) to optimize system buildout. However, as noted on Page 14 of the plan, SANDAG has a specific requirement to identify disadvantaged communities, include strategies to reduce pollution exposure in those communities, and use of a skilled and trained workforce (via the RTP/SCS). So, the “balancing” decision must have a larger frame of reference than just GHG emission reductions.</p>	<p>Thank you for your comment.</p>
L285	<p>Page 44. The plan should clarify that the region’ projected population growth will result in continued – albeit slowing - total VMT, but implementing the plan will result in a significant net reduction in VMT/capita that is consistent with the requirements of SB 375.</p>	<p>Information on estimated VMT performance of the 2021 Regional Plan is included in Appendix T.</p>
L286	<p>Page 45. As described, there are real constraints on the allowable uses (types of project investments) and timing (when available) of the known and reasonably anticipated funding sources. Our prior comments (e.g., Pages 19, 27, 32-33) raised concerns about how the RTP/SCS will ensure concurrent and effective linking of the growth in the mobility hubs (smart growth areas) with the transportation infrastructure. This is particularly of concern because growth in the mobility hub areas may occur – based on local jurisdictions’ requirements and needs - even if the transportation infrastructure and operational improvements are not able to be funded concurrently. How will the RTP/SCS ensure (and measure/monitor) that the housing/jobs/transportation linkage will occur as needed?</p>	<p>Priority Implementation Action #10 is to advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery. SANDAG will be implementing the 2021 Regional Plan, monitoring performance, and updating the plan every four years to incorporate the latest data, policies, and incorporate corrective measures.</p>
L287	<p>Pages 45-47. The projected costs to implement the revised transportation infrastructure and operations, combined with SCS strategies, will require SANDAG to evaluate and adopt new revenue funding sources. The plan does not provide sufficient descriptions of how SANDAG will evaluate the effectiveness of implementing the identified potential new revenue sources. For example, charges for Managed Lane use and a general Road User Fee potentially overlap costs for drivers; paying the premium for managed lane access may induce more VMT as well as be cost-prohibitive to lower income populations; there is no discussion about how local jurisdictions could/should adopt parking cost strategies to both promote transit (reduce vehicle use) and increase revenues that can be then incorporated into their local funding share.</p>	<p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
		considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, fair to all.
L288	Page 50. Successfully implementing the regional plan will require cooperation with and incentives for participation by the member jurisdictions and cooperating agencies that comprise SANDAG. The plan needs to provide more description of how SANDAG's current incentives programs ( <a href="https://www.sandag.org/uploads/publicationid/publicationid_1187_5188.pdf">https://www.sandag.org/uploads/publicationid/publicationid_1187_5188.pdf</a> ) will be augmented and prioritized to ensure that the necessary infrastructure and operational investments correspond to the projected growth (e.g., location of new housing and jobs)	Appendix B describes the actions SANDAG will take to update and initiate new incentive programs for member agencies. These are detailed under Priority Implementation Action number 8.
L289	Page 53. The plan proposes a reasonable list of priority implementation actions. One item that is not discussed in the plan but is referenced in Item 9 is to expand nature-based climate solutions. As recommended in our prior comment on Page 9 of the plan, it should provide more description about the regional environment, which would then establish the context for "nature-based solutions." Though the assessment/analysis of what those solutions are and how they advance the goals of the RTP/SCS will be part of the subsequent CEQA EIR, this document needs to better describe (at a general level) what this action involves.	Nature-based climate solutions are described with more detail in Appendix B. More detail on the natural environment and nature-based solutions has been added to Chapter 2.
L290	Pages 54-55. Monitoring must address both implementation and performance. The proposed performance indicators align with the regional plan's goals and would collate/integrate relevant existing measurement/data and reporting sources. But the corresponding implementation monitoring needs to be better described and some additional monitoring considered. As noted in our comment on Pages 13, 27 and 32-33, the plan does not effectively illustrate how the key components are expected to integrate. Specifically, the plan needs to monitor and report (and provide simple illustrative mapping) how the actual growth in housing/jobs within the mobility hubs/smart growth areas and the associated transportation infrastructure/operational improvements are in alignment and how they are advancing compared to their anticipated advancement per this plan. This type of implementation tracking and reporting is essential and it does not appear to be covered by the proposed performance indicators in Table 3.1.	These comments will be considered as SANDAG implements Priority Implementation Action #10 to advance a data science program to better understand travel behavior in the region, update travel demand modeling tools, and improve transparency and reporting on program effectiveness and project delivery.
L291	General Comment. This appendix is essentially a matrix of SB 375, AB 805 and other legislative/legal requirements and a compilation of past documents that were used to prepare specific components of the RTP. Providing a conformance matrix of those requirements and what is in the RTP does not explain how the RTP comprises a sustainable communities strategy. At a minimum, this appendix should provide a short (a page or two) summary of how the plan integrates critical elements or summarize sections from Chapter 2 in the main body of the RTP/SCS where an explanation of that integration (the basic strategy) is provided.	Chapter 2 of the 2021 Regional Plan is the Sustainable Communities Strategy (SCS). Appendix D is SCS Documentation and Related Information.
L292	<p>Page D-4. While the state does not set a 2050 target for GHG emissions reduction and the MPOs are not required to produce an official GHG reduction target for 2050, the projected regional reduction of 20.3% from the 2005 baseline is alarming. That is only 0.3% below the 2035 regional reduction, which implies that all of the anticipated new GHG reductions within the region "max out" their effectiveness by 2035. One can assume that between now and 2035 there will be additional regulations and technologies that will force/enable the region to improve upon that projected 2050 reduction. In that vein, this document should include more extensive discussion about how and what future iterations of the RTP/SCS will commit to doing to continue to identify relevant GHG reduction options for the region. Presenting this number and then not providing further discussion about how SANDAG will be addressing what appears to be a "stalled" GHG reduction effort post-2035 is neither sufficient nor acceptable. The relevance of this concern is clearly illustrated by the data provided in Appendix F (Figure 1) regarding the projected population growth, which is estimated to be 437,000 between 2016 and 2050 –about a 13% increase. Even if the region added only roughly 100,000 people from 2035-2050, absent a more aggressive RTP/SCS that is initiated well before 2035, the region would be totally incapable of attaining the state's "target reduction" of 80% below baseline by 2050 or the more recently cited statewide goal of net zero by 2040. The RTP/SCS should, at the least, provide a discussion about how future versions of the document will be addressing post-2035 GHG emission reductions.</p> <p>Page D-20. The legend for this figure should be revised to "Existing and Proposed/Potential San Diego Region Habitat Conservation Lands."</p>	<p>SANDAG is required to update the Regional Plan every four years to incorporate the latest data, policies, population projections, and technology assumptions. SANDAG will consider additional strategies to reduce GHG emissions in future iterations of the Regional Plan.</p> <p>The legend for this map has been updated.</p>
L293	This appendix provides only a minimal level of information and it is unclear when the appropriate level of detail necessary to implement the performance monitoring will be developed and made available. The types of issues subject to monitoring (e.g., Health and Environment; Energy and Water; Housing; Quality of Life; and Transportation Planning) address issues relevant to SB 375 and other mandates, and the Indicators and Sources of Information seem reasonable. But the appendix does not provide any discussion or examples of how the indicators will be used. For example, which components of "Air Quality" are to be used, what are the relevant standards, etc. When a general indicator is to be used	A performance monitoring report using the indicators from Appendix E is developed halfway between each 4-year regional plan cycle. The report is shared with the SANDAG Board of Directors to provide a high-level status update on critical areas across the region. This information helps inform the Board of Directors in their development of regional goals for the subsequent regional plan. The indicators use available observed data which also informs how each indicator is calculated.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	(e.g., Percentage of households with housing costs greater than 35% of income), what is the RTP/SCS intending to do with that number?	
L294	For all Indicators, one presumes that there is a threshold or trigger point (for when the plan is failing to meet an objective) at which the plan would be required to begin to initiate actions in response to reaching the trigger/threshold. Or conversely, if the threshold indicates that the plan has successfully achieved a goal, what if any additional effort is required?	There are no targets or thresholds associated with the indicators in the performance monitoring report. The indicators serve to inform the planning process and decision makers on trends and changes for the region.
L295	The RTP/SCS performance monitoring plan will likely have to be periodically updated to reflect new requirements (e.g., air quality standards may change), new technologies may allow for improvements to the current indicators, and conditions may warrant changes in the types of issues relevant to the plan and/or the identified indicators may need to be revised or replaced. Regardless of that reality, the public, stakeholders and jurisdictions/agencies that will be reporting, evaluating and relying on the performance monitoring to determine how the RTP/SCS is functioning must be provided a more complete description of the performance monitoring plan.	The Regional Plan performance indicators are reviewed for changes with each regional plan. Updates to the indicators are often from changes in policy direction and data sources. Past Regional Plan Performance Monitoring Reports, which include detailed methodology, are available at: <a href="https://www.sandag.org/index.asp?classid=12&amp;projectid=309&amp;fuseaction=projects.detail">https://www.sandag.org/index.asp?classid=12&amp;projectid=309&amp;fuseaction=projects.detail</a> .  Air quality conformity, which addresses federal Clean Air Act requirements, is covered in Appendix C.
L296	Pages F-10-12 (Tables F.1-3). While there appears to be a similarity in the relative growth in population, jobs and housing among the jurisdictions, the Unincorporated County's projected population growth (0.9%), jobs growth (23.2%) and housing growth (4.3%) seem to be noticeably different. In particular, there is a very high projected growth in jobs compared to population and housing. How does that seeming disparity in jobs growth with population and housing growth (which has implications for transportation to housing) impact transportation planning? Are there other jurisdictions for which the "disparity" in projected population, jobs and housing pose challenges to the RTP/SCS's 5 Big Moves approach?	Forecasted job growth in the region is a result of the size and age/race/ethnicity/sex composition of the projected population as well as higher projected labor force participation rates in the future. Population, housing unit, and job data were all incorporated into the development and implementation of the 5 Big Moves. Job and housing growth are both concentrated in the Mobility Hubs in order to ensure that current and future residents will be able to access future jobs in the area.
L297	Page F-15 (Figure F-5) – Five areas that appear to support significant jobs but are outside of mobility hubs are Camp Pendleton, MCAS Miramar, Pt. Loma and North Island (military employment) and East Otay Mesa. How are SANDAG and the military services planning to address this?	Military job growth is concentrated on current sites of military employment because of the unique characteristics of military jobs. This job growth will be outside of Mobility Hubs unlike other private employment in the region. Additionally, during the development of the Mobility Hubs, staff ensured that each military installation is located near a Mobility Hub so that military personnel have access to transit and other amenities offered on Mobility Hubs.
L298	Page AA-1. The introductory paragraph – or a new second paragraph - should include a brief description of the relationship of SANDAGs existing TransNet program, the regional Multiple Species/Multiple Habitat Conservation programs and regional funding for habitat conservation and preserve management. Any significant differences in the proposed RTP/SCS from previous versions should be discussed later in this appendix.	The text includes a discussion of the history of regional funding for habitat conservation, the role that SANDAG has played in the past, and the potential future role SANDAG could play as part of the implementation of the 2021 Regional Plan.
L299	Page AA-3. Figure AA.1. Recommend the map title be revised to "Existing and Proposed/Potential San Diego Region Habitat Conservation Lands" and change the legend to conform.	The title and legend has been updated.
L300	Page AA-6. The Regional Habitat Conservation Vision presumably applies across all of the lands within the SANDAG member agencies. Because the local jurisdiction and agencies have their own General Plans/Open Space Element, Climate Action Plans, and other planning processes that would have direct effects on a regional vision, please provide more discussion regarding how this vision is expected to be integrated into the local jurisdictions' and agencies' plans. Such as, will SANDAG add staff to coordinate this effort, what new policies and projects would this require, will additional funding be identified and provided, etc.	The 2021 Regional Plan indicates that the region must come together to take on implementation of the completion of the regional habitat conservation plans that were started in the 1990s. SANDAG has served as a forum for these discussions in the past and can be again. Implementation of the Vision would be made after adoption of the 2021 Regional Plan.
L301	Page AA-6. The Regional Funding section should add more information. We recommend adding more to the introduction of this issue. Begin the section with a new introduction: "A functioning and adequately funded set of regional habitat preserves is essential to this region's overall capability to address climate change. The benefits from habitat preserves range from meeting regulatory requirements associated with future development and ongoing operations and maintenance by the local jurisdictions; improving/enhancing the long-term potential for rare/threatened species and their habitats to adapt to climate change; providing for movement by species and vegetation communities as a response to climate change; and serving as a carbon sink. While these conserved and managed lands are part of the "baseline" condition relative to GHG emissions, they are valuable because natural areas remove CO2 and eliminate development potential." Also, revise the last part of this paragraph to state: "A regional funding source was proposed as part of a ballot measure (that failed) in 2016 to help offset the preserve implementation costs to local jurisdictions. Without a new regional funding source, securing crucial land acquisitions and long-term management and monitoring, which are essential to the success of these plans to protect species and their habitats from extinction, falls into question. In 2011, the estimated unfunded regional cost to ensure implementation of the regional habitat conservation plans was \$3.0 billion. SANDAG will work with the member agencies to develop and promote the establishment of the regional funding source that complements the infrastructure and operations components of the 5 Big Moves."	The text in Appendix AA has been updated to reflect the sentiment of the recommendation.  To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified \$2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a \$565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional \$300-\$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A). SANDAG is committed to working with its regional partners to identify funding to fulfill this commitment.
L302	Page AA-6. Recommend revising the sentence "Connect habitat areas through wildlife corridors and linkages and connect people to local species and San Diego's natural habitats." to "Connect habitat areas through wildlife corridors	The text in Appendix AA has been updated to reflect the sentiment of these recommendations.

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>and linkages, and enhance peoples' access, where appropriate, to natural habitat areas.”</p> <p>Page AA-7. Recommend adding a sentence to the end of the paragraph: “It is essential that the remaining habitat conservation plans be completed, which will then establish the necessary core habitat areas and key connections across the region.”</p> <p>Page AA-8. Recommend revising the following sentence “In addition to acquiring more properties to connect wildlife, in the following years, San Diego’s North County will complete their MSCP, which will prioritize acquisitions that establish critical connections for high-risk species that reside in North County communities.” To state “In addition to acquiring more properties to connect wildlife, in the following years, when the North and East County MSCPs are completed, they will prioritize acquisitions that establish critical connections for high-risk species that reside in North/East County as well as connections to preserve lands in Orange and Riverside counties.”</p> <p>Page AA-10. The paragraph that describes regional funding should reference - or reiterate - our recommended new statement (Page AA-6) regarding SANDAG’s commitment to work with its member agencies to develop and establish a new regional funding source for habitat conservation.</p>	
<b>San Diego County Bicycle Coalition</b>		
L303	Several projects that were in the Early Action Plan appear in Appendix A. How do the projects in the EAP differ than the projects here?	In September 2013, the SANDAG Board of Directors approved \$200 million in local transportation funding, intended to be leveraged for and supplemented with grant funding, to implement the Regional Bike Plan EAP. Since that time, SANDAG has been working on public outreach, environmental review, design, and construction to complete the EAP projects and in this process has more specifically defined the EAP projects which are now capital improvement projects.
L304	In general, the dollar amount spent on managed lanes rather than mode-shift is concerning. More funding and increased timelines for active transportation & transit leap projects should be prioritized.	A better transit system is a fundamental component of this Regional Plan. Revenues to fund the transit projects don't come in all at once but dollars that are available are applied to ensure that the best transit projects are initiated first and that those projects address social equity considerations. The investments in Managed Lanes will support high speed transit service to ensure time competitive trips as compared to the auto.
L305	Page A-14, Section TL58 How does the San Diego - Coronado Military Ferry connect to the Central Mobility Hub?	The airport transit connector is envisioned to have a station at the East Basin near Harbor Island that would provide a connection to a new ferry terminal that would serve Naval Air Station North Island.
L306	Page A-42, Table A.13 In general, the Arterials section neglects to mention active transportation and public transportation facilities along arterial corridors. If SANDAG wants to get San Diegans out of their cars, then arterial streets need to prioritize pedestrians, bicycles, and public transportation over cars.	The arterials portion of Appendix A are projects from the various cities through the RTIP programming process (using Local Streets and Roads funding). The inclusion of complete streets and active transportation elements would be outlined in each of those projects' descriptions by “TIP ID” in the RTIP.
L307	<p>Page A-42, Project CB04B This intersection’s bike lanes are in need of protection and better visibility for drivers. NCTD Bus 309 stops at this intersection as well, is SANDAG planning on providing any infrastructure improvements for bus and pedestrian connectivity?</p> <p>Page A-42, Project CB22 SANDAG should prioritize building safe active transportation infrastructure to and from the Carlsbad Poinsettia Station along this corridor. Sidewalks and bike lanes heading north disappear at the station, and this project makes it appear that SANDAG isn’t planning on including those elements. SANDAG should not widen Avenida Encinas from Palomar Airport Road to Embarcadero Lane. Instead, SANDAG should keep the current configuration and build wide sidewalks and protected bicycle facilities.</p> <p>Page A-42, Project CB31 The bike lane along this segment of El Camino Real is often subject to vehicle intrusion. SANDAG should add protection to the bicycle facility here to keep cyclists safe.</p> <p>Page A-42, Project CHV69 SANDAG must include in this project upgrades the existing bicycle connection to the North Island Credit Union Amphitheatre. The currently existing Class II lanes on Heritage Road are often subject to vehicle intrusion.</p> <p>Page A-42, Project CNTY14A</p>	<p>The 2021 Regional Plan aims to create safe and well-connected routes for bicyclists and pedestrians. The intention of the network in this Regional Plan is a framework which facilitates trips associated with regional purposes designed to enhance neighborhood connections to schools, employment centers, and other everyday destinations. The regional network will not include details regarding the types of bicycle and pedestrian facilities for specific projects are not yet determined and will require future planning and coordination with local jurisdictions, community members, and stakeholders such as your organization. SANDAG looks forward to working with you on these project details in the future.</p> <p>The misspelling pointed out in project O22 on page A-43 has been updated in our documentation.</p> <p>Your comment was forwarded to agencies that oversee these facilities.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>SANDAG must build Class IV protected bike lanes in addition to pedestrian safety improvements along this corridor to improve connectivity to the Sprinter and NCTD Buses 305 &amp; 332.</p> <p>Page A-43, Project CNTY21 Additional pedestrian safety measures are needed for the Overpass at SR-67, including bulb-outs and more visible crosswalks.</p> <p>Page A-43, Project CNTY34 SANDAG must be specific about what bike facilities are planned for the Dye Road Extension in Ramona.</p> <p>Page A-43, Project CNTY98 The current condition of Otay Lakes Road has Class III bike facilities. What facilities are planned for this project?</p> <p>Page A-43, Project ESC04 SANDAG has forgotten to include what happens to the currently-existing Class II buffered bike lanes with this project. Bicycle lanes should be included in the bridge design over Escondido Creek.</p> <p>Page A-43, Project ESC08 SANDAG should include safe bicycle facilities in this project.</p> <p>Page A-43, Project ESC24 What intersection improvements are planned? How will SANDAG maintain or upgrade the existing bicycle facilities? In addition, Mission Road is misidentified. The street becomes Mission Avenue after it crosses I-15.</p> <p>Page A-43, Project NC01 SANDAG should include safe bicycle facilities in both Phase II and Phase III of this project.</p> <p>Page A-43, Project O22 The street Avenida de la Plata is misspelled here. SANDAG should add protected bicycle facilities along this corridor.</p> <p>Page A-44, Project SD34 SANDAG has forgotten to include what happens to the currently-existing Class III sharrows with this project. Bicycle lanes and sidewalks should be included in the design to connect to future planned bus service at Via de la Valle.</p> <p>Page A-44, Project SD70 What bridge is SANDAG planning on replacing? These bridges are extremely busy and bicycle facilities should be protected Class IV, not Class II.</p> <p>Page A-44, Project SM19 The six-lane arterial street from Craven to Grand Avenue must include safe, protected bicycle infrastructure to provide a complete network. The intersection of Craven Road and Discovery Street should be redesigned to close the slip lane and provide safe crossing for cyclists and pedestrians.</p> <p>Page A-44, Project SM24 SANDAG should add protected bicycle lanes along this project, and include a safer pedestrian crossing under SR-78.</p> <p>Page A-44, Project SM31 The proposed widening of Discovery Street from Via Vera Cruz to Craven Road must include safe, protected bicycle facilities and pedestrian infrastructure.</p> <p>Page A-44, Project SM32 This project must include safe, protected bicycle facilities and pedestrian infrastructure to provide network connectivity.</p> <p>Page A-44, Project SM42 This project must include safe, protected bicycle facilities and pedestrian infrastructure to provide network connectivity to CSU San Marcos.</p> <p>Page A-45, Project SM48</p>	

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>This project's bike path should not meander, but provide clear connectivity along the route to promote bicycle commuting.</p> <p>Page A-45, Project SM69 The intersection of Twin Oaks Valley Road and Barham Drive in San Marcos is currently hostile to pedestrian and bicycle traffic, with slip-lanes and disappearing bicycle lanes. What plans are in place to increase use of active transportation at this intersection?</p> <p>Page A-45, Project CB212 What classification of bicycle facilities are being planned for College Boulevard Reach A?</p> <p>Page A-45, Page CNTY35 What classification of bicycle facilities are being planned for the Ramona Street Extension? SANDAG should also consider re-striping and adding more signage to Ramona Street's currently-existing lanes.</p> <p>Page A-45, Project SD190 What bicycle facilities will SANDAG include in the Palm Avenue Bridge project?</p>	
L308	<p>Page A-54, Table A.17 Support for increased funding for GO by BIKE, and an e-bike incentive program.</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
L309	<p>Page A-54, Table A.18 What is the cost breakdown of the local bike program?</p>	<p>These costs are either a per-mile by-facility-type estimate or, percentage of a local jurisdiction's CIP budget.</p>
L310	<p>Page A-55, Table A.19 SANDAG should consider incentivizing alternative cargo delivery vehicles for local delivery services under this table. For example, incentivize the usage of cargo e-bikes for parcel delivery in dense, urban neighborhoods.</p>	<p>Flexible Fleets include a variety of mobility services that provide sustainable alternative for moving people and goods. Last mile delivery services like cargo bikes, autonomous shuttles, and drones are part of the Flexible Fleets strategy and are envisioned to be concentrated within mobility hubs throughout the region. SANDAG is developing a Flexible Fleet Implementation Strategic Plan that will identify near-term opportunities for Flexible Fleets including last mile delivery. SANDAG will also be initiating a "San Diego and Imperial Counties Sustainable Freight Implementation Strategy" (Strategy) this winter that will identify regional opportunities for sustainable freight projects and policies, and increasing the use of cargo bikes and their supporting infrastructure will be explored as one of these strategies. The next Regional Plan will incorporate recommendations from this Strategy and future last mile delivery pilots.</p>
L311	<p>Page A-68, Figure A.11 Segments of the Bayshore Bikeway that are already completed seem to be missing from this map.</p>	<p>SANDAG staff will review the final maps specifically to ensure that all portions of the Bayshore Bikeway which have been built to their final proposed condition are included appropriately.</p>
L312	<p>Page B-4, Section 3(b) Support updating the evaluation and monitoring procedures of projects using TransNet local streets and roads funds, including prioritization of safety for vulnerable road users in the development of complete streets. The procedures should include a mechanism for the public to comment.</p> <p>Page B-4, Section 3(c) Support the development of a Regional Active Transportation Plan, including updating the San Diego Regional Bike Plan to reflect need for safe bicycle infrastructure county-wide.</p> <p>Page B-4, Section 3(d) Support the development of a Regional Vision Zero Action Plan, including a Regional Safety Policy. This regional safety policy should establish clear procedures that allow for the collection of accurate crash data, and the usage of that data to make changes to dangerous designs.</p> <p>Page B-7, Section 7(a) Support the implementation of the 2021 Regional Transportation Improvement Program (ETIP) &amp; building bike early action program projects</p> <p>Page B-7, Section 7(d) Support building projects with an emphasis on safety for all road users to implement Vision Zero</p> <p>Page B-7, Section 8(b) Support for updating evaluation criteria and provisions of SANDAG grant programs to improve social equity, advance roadway design with an emphasis on safety for vulnerable road users, implement climate action plans, and others listed.</p>	<p>We appreciate your support and feedback on the implementation actions outlined in Appendix B. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Page B-8, Section 8(e) Support for incentivizing implementation of complete streets projects that complement regional investments within Mobility Hubs, along Complete Corridors, and supporting Flexible Fleets. We absolutely support a formalized Quick Build implementation program that develops complete streets solutions.</p> <p>Page B-9, Section 9(g) Support for transportation demand management grant and incentive programs, including e-bike, carpool, and vanpool incentives</p> <p>Page B-10, Section 10(a)(b)(c)(d)(e) Support for policies outlined under this heading</p>	
L313	<p>Page D-8, Table D.3 This table lists micromobility costs as \$0 for access/egress to transit. Does this mean SANDAG is planning on subsidizing micromobility rides as a last mile solution?</p>	Yes, SANDAG has modeled micromobility with no cost when it is used to access/egress transit. The implementation of this would be through Flexible Fleet partnerships.
L314	<p>Page D-8, Table D.3 What model is SANDAG using to determine that 36% of privately owned bikes will be e-bikes by 2035?</p>	SANDAG estimated future use of e-bikes based on market trends and impact of future incentives for e-bike purchases.
L315	<p>Page E-2, Section: Housing Support the addition of using Housing as a Performance Indicator.</p> <p>Page E-2, Section: Quality of Life Support the addition of using unemployment, social equity, telework, and homelessness as a Performance Indicator.</p> <p>Page E-3, Section: Transportation Planning Support the addition of using Bike Lane Miles and Annual Transit Ridership as a Performance Indicator.</p>	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
L316	<p>Page G-50, Section 3.0 Support the inclusion of SANDAG's Commitment to Equity Statement</p> <p>Page G-50, Section 3.1 Support for Social Equity and Environmental Justice Considerations</p> <p>Pages G-51 &amp; G-52, Sections: 3.2 - 3.5 Support for working in partnership with Tribes, Mexico, Military, and other stakeholder agencies</p>	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
L317	<p>Page G-53, Section 4.0 - Table 1: Public Workshops Rather than increasing the amount of public workshops by an arbitrary number (10%), SANDAG staff should use data to calculate public engagement by geographic region throughout the county, and use that data to determine low engagement rates where more public workshops are needed.</p>	Community input is critical to creating a plan that represents the varied values, needs, and interests of the San Diego region's residents and businesses. SANDAG is committed to conducting effective public outreach as part of the 2021 Regional Plan as well as all of our planning and constructions activities and agrees that data should continue to inform our planning as well as outreach and communications activities.
L318	<p>Page G-53, Section 4.0 - Table 1: Pre-document consultation Add: "Gather an additional" to "5,000 individual remarks" so context is more clear</p>	We appreciate your feedback and suggestions.
L319	<p>Page G-53, Section 4.0 - Table 1: Opportunities for engagement Rather than "increasing variety of platforms for public engagement by 15%", the goal should be to re-evaluate the effectiveness of current platforms being used during a certain time period and then determine if another platform could be more effective. In addition, special topic/targeted workshops should be made available in as many languages as possible and include dedicated outreach to stakeholder groups who have not participated in or have been historically excluded from the public engagement process prior to the 2021 Draft Regional Plan.</p>	A key objective of SANDAG's outreach effort is to engage with people in historically underserved communities throughout the planning process. SANDAG is currently identifying the potential effectiveness of new communications platforms, including new social media platforms. Additionally, we routinely evaluate the effectiveness of outreach to traditional media platforms, such as print, radio, and TV outlets, to determine if outreach should be expanded to more effectively reach diverse audiences throughout the region. Public facing materials may be translated into multiple languages upon request. Spanish language interpretation is made available at public meetings, and interpretation in additional languages is available upon request.
L320	<p>Page G-57, Appendix A.1 In order to reach a younger audience, "San Diego County Media Outlets" should be expanded to include student publications at the region's school systems and colleges/universities. In addition, many young people engage with social media accounts for local news information, so SANDAG should research where they could make an impact through social media channels besides their own.</p>	SANDAG strives to engage people of all ages in public outreach throughout the planning process. This feedback will be incorporated into Appendix G.
L321	<p>Page H-15, Section: Existing Conditions in Disadvantaged Communities in the Region SANDAG notes that 5.7% of households in the region have "zero vehicles available" but hasn't defined what a vehicle is outside of being "dependent on transit services." How does SANDAG define "transit services?" If a person didn't own a</p>	A vehicle, in this case, is considered to be an automobile.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	car, but used a personal bike, skateboard, or rented a micro-mobility solution to travel, would that person be considered as “not having access to a vehicle”?	
L322	Page H-33, Section: Defining Performance Measures for Social Equity Analysis Support using percentage of population within 0.25 miles of a Bike Facility as a social equity performance measure.	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
L323	Page H-55, Section: Access to Basic Needs Why were biking and walking metrics only included for parks and retail sections, but not for access to employment or education centers?	The purpose of these access measures is to gauge network performance to concentrated, high-demand employment centers (see Figure T.5) and higher education centers that are regionwide destinations. Transit was used to cover the regionwide travel shed with walking and flexible fleets as the means to access transit.
L324	Page H-58, Table H.11 The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access parks, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most parks are not considered accessible by regional bicycle advocates. How was “Access” by bike defined and used in these calculations? Did safety, comfort, bike parking, and ridership play a part in defining “access” by bicycle?  Page H-60, Table H.12 This table has the same issue with Table H.11. The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access retail spaces, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most retail/commercial areas are not considered bicycle-friendly by regional bicycle advocates.	Access is based strictly on location/proximity of residents to various amenities (parks, retail, employment, etc.).
L325	Page K-29, Section 5: Objectives and Factors Support the promotion of shared-use mobility, including bike sharing	We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a> .
L326	How does SANDAG plan to promote use of active transportation by allowing bicycles on transit?	By working with our partners at NCTD, MTS, and Caltrans/LOSSAN.
L327	How does SANDAG plan on expanding the bicycle locker program?	SANDAG is adding new electronic bike lockers at all the Mid-Coast stations in Fall 2021. Two of those stations (Nobel & University Towne Center) will have group bike parking facilities to accommodate up to 40 bikes each. We will continue to monitor daily usage and reallocate resources accordingly. Additionally, SANDAG will study existing transit stations to determine if bike lockers could be beneficial in the future.
L328	SANDAG should consider adding bicycle cars on trains to accommodate bicycles on trains.	Thank you for the suggestion.
L329	Page L-6, Section: Complete Streets in Mobility Hubs What does “enhanced bike and micromobility parking” mean?	Secure Parking Areas, primarily.
L330	Page L-7, Section: Vision Zero What are the details of SANDAG’s plan to collect and analyze crash data for bicycle traffic?	We will continue to use the statewide resources provided by CHP via SWITRS. Additionally, SANDAG’s ARJIS staff works with public safety data and discussions are ongoing with local jurisdictions regarding the prospect of supplementing that statewide-maintained data with any additional collision reporting at the local jurisdiction level which may not be included in the FARS/SWITRS databases.
L331	Page L-7, Section: Riding into the Future What is the timeline for SANDAG developing a new, comprehensive Regional Active Transportation Plan as a near-term action from the 2021 Regional Plan?	Near-term actions are commitments to be implemented prior to the next Regional Plan (2025).
L332	Page L-10, Section: Significance of Reduced Speed Limits What is SANDAG’s plan to reduce speed limits in San Diego County?	SANDAG submitted a letter of support for Assembly Bill (AB) 43 and will continue to support the recommendations from the AB 2363 Zero Traffic Fatalities Task Force.
L333	Page L-16, Section: Principles by Layer: General Add: Limit bicycle interaction with mixed traffic wherever possible	SANDAG follows national and international best practices in bikeway design to create safe facilities for users of all ages and abilities. Multiple studies show that most people feel safer in protected bikeways, and when well designed, they are safer than any other type of bike facility. The focus of our efforts is on people who may be “interested but concerned” in riding a bike alone or with family. For those who do not feel comfortable riding in protected bikeways, the California Vehicle Code allows people to bike in the roadway with traffic. While protected bikeways are a great solution in many cases, we know they are not always the best solution. Every project goes through a detailed and context sensitive design process which results in decisions regarding the best facility, which may include protected bikeways, buffered bikeways, shared use paths, or shared streets with significant traffic calming elements. The Regional Plan also includes funding for upgrading existing bikeways that may not meet current best practices in maintenance or bikeway design.
L334	Page L-16, Section: Principles by Layer: General All Transit Leap nodes should be served by bicycle routes.	Bikeways are fundamental component of the Mobility Hubs and the active transportation networks will be developed in conjunction with these projects.

L335	<p>Page L-22, Table L.1 SANDAG should ensure that Bicycle Facility Selection Plan tool is used consistently throughout the region, and that any arterial/TransNet funds follow this tool.</p>	<p>SANDAG intends to make the Bicycle Facility Selection Plan tool available to local jurisdictions and a recommended approach.</p>
L336	<p>Page M-8, Near-term Action #4 Support for the promotion of vehicle miles traveled reduction through Regional Complete Streets Policy</p>	<p>We appreciate your support and feedback. Please continue to follow along in this process by visiting <a href="http://SDForward.com">SDForward.com</a>.</p>
L337	<p>Page M-9, Near-term Action #5 This action item should be amended in two ways: 1) SANDAG should include pursuing data-sharing agreements with mobility companies operating in the San Diego region, and 2) SANDAG should begin procuring more bicycle and pedestrian counters, and identify places where they are needed</p>	<p>1) SANDAG is actively developing data sharing agreements to be executed with shared mobility providers operating in the San Diego region. Beginning first with micromobility providers, this data will assist SANDAG with honing our planning and modeling capabilities as we demonstrate how Flexible Fleets contribute to the reduction of vehicle miles traveled and enhanced personal mobility.</p> <p>2) SANDAG maintains 10 automated bike counters and 2 pedestrian counters on 8 regional bike network corridors. SANDAG will be purchasing more counters in order to re-install at these same locations in conjunction with our bikeway projects in order to have longitudinal data on these upgraded bikeways. SANDAG also convenes a bi-monthly meeting of local agency staff that are currently, or will be, maintaining bike and pedestrian counters to ensure technical assistance and knowledge sharing is facilitated at the regional level.</p>
L338	<p>Page M-16, Near-term Action #11 Support for the development of a regional military base access plan and implementation program. Most of San Diego’s military installations are uniquely positioned within urban contexts and SANDAG should incentivize active transportation and public transportation usage to/from these sites.</p> <p>Page M-17, Near-term Action #12 Support for the development of a Regional Mobility Hub Strategy</p> <p>Page M-25, Continuing Action #11 Support for continuing to seek funding for transportation investments that provide a variety of choices, reduce greenhouse gas emissions, and promote healthy lifestyles through more active transportation.</p> <p>Page M-26, Continuing Action #12 Support for capital and planning grants to local jurisdictions to support smart growth, biking, and walking, and seek additional funds to leverage existing grant programs.</p> <p>Page M-27, Continuing Action #14 Support for implementation of state-of-the-art technologies and Transportation Demand and Systems Management Programs to provide more mobility choices and allow the transportation system to function more efficiently. SANDAG should prioritize bike education services, upgrading and expanding bike lockers and bike parking throughout the region, and increase funding for Shared Streets grants.</p> <p>Page M-30, Continuing Action #18 Support for opportunities to expand shared mobility services near Smart Growth Opportunity Areas. SANDAG should consider how expanded mobility services interact with the surrounding communities and provide safe infrastructure for those services.</p> <p>Page M-31, Continuing Action #20 Support for identifying transportation solutions to improve connectivity to the San Diego International Airport. These solutions should include building safe long-term bike parking and provide connectivity to existing bikeways in the community</p> <p>Page M-33, Continuing Action #22 Support for continuing to apply social equity and environmental justice considerations in the implementation of SANDAG projects and programs.</p> <p>Page M-33, Continuing Action #23 Support for collaboration with key partners and stakeholders, including representatives from low-income and minority communities, and actively involve the public in the planning process. SANDAG should create guidelines for conducting outreach and collaboration, and gather data to improve performance. SANDAG should also continue to provide ongoing</p>	<p>We appreciate your support and feedback. **Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>outreach across many languages to ensure communities that were traditionally underrepresented have a voice in the process.</p>	
L339	<p>Page P-1, Section: Year-Round Tourism San Diego has a thriving tourism industry that unfortunately relies on tourists renting cars to visit popular tourist destinations. This appendix does not present any strategies to mitigate VMT from car rental services, nor does it lay out any strategies to provide alternative transportation access to any of San Diego’s major tourist attractions that rely on vehicle access. Tourist destinations are not only places to visit, but many of them are major employment centers that could benefit from efficient transportation connections.</p> <p>Page P-1, Section: Year-Round Tourism SANDAG should also consider other services that tourists use in San Diego County and how they interact with the Regional Plan. This includes hotels, the airport, the cruise ship terminal, and alternative tourist mobility solutions such as the Old Town Trolley, GoCar City Tours, hotel and airport shuttles, etc.</p> <p>Page P-1, Section: Year-Round Tourism San Diego is a world-class bike tourism destination. The 2021 Regional Plan should reflect the need for facilities to accommodate bicycle tourism.</p> <p>Page P-3, Section: Special Events SANDAG should consider adding pop-up safe bicycle parking to special events to incentivize San Diegans to ride their bicycles to special events.</p> <p>Page P-4, Section: Next Steps SANDAG should study traffic patterns of major tourist destinations and devise strategies to reduce VMT and incentivize public/active transit usage.</p>	<p>The Regional Plan Appendix P highlights transit routes that provide access to major tourist destinations. The Regional Plan addresses connecting rural destinations with complete corridors to improve multimodal connectivity. In addition, the Central Mobility Hub and the San Ysidro Mobility Hub are noted since they will provide critical transit and flexible fleets connections and amenities for residents and visitors. The ideas mentioned in your comments to promote alternative tourist mobility solutions present an opportunity for collaboration with the tourism authority, visitors bureau, local chambers of commerce, and stakeholders such as your organization to seek future grant funding to develop a regional travel and tourism strategy.</p>
L340	<p>Page S-21, Section: Active Transportation Network Input The five classification types described in this section don’t seem to match anywhere else in the SANDAG RTP, and should be rethought to better fit the language throughout the document. For example, this appendix references bike boulevards as Class IV facility, but Appendix L-25 describes a bicycle boulevard as “most similar to the Class 3 facility.” If SANDAG is going to change classification types for modelling purposes exclusively, this appendix should specify that. In addition, the Active Transportation Network Input should take into account the surrounding infrastructure (speed limits, driveways, and other bikeway intrusions) to determine the comfortability of riders using the facility.</p>	<p>There was a misclassification of “cycle tracks” which are Class IV bikeways as per the CVC. We will make this edit.</p>
L341	<p>Page T-25, Table T.9 The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access parks or retail within 15 minutes, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most parks and retail spaces are not considered accessible by regional bicycle advocates. How was “Access” by bike defined and used in these calculations? Did safety, comfort, bike parking, and ridership play a part in defining “access” by bicycle?</p>	<p>The data presented in this table are modeled results from SANDAG’s Activity Based Model (ABM). This model can take into account several factors such as travel distance, speed, and network availability but it cannot account for perceptions of safety, comfort, or availability of bike parking. Access is the ability to traverse the transportation network to the specified destination within the designated timeframe. The ABM is updated regularly with the latest available data and best practices to represent regional travel; please see Appendix S: Travel Demand Modeling Tools for more information.</p>
L342	<p>Page T-27, Table T.10 The bicycle statistics laid out in this table are inaccurate and out-of-touch with reality. While theoretically true that a bicycle could use the existing network to access parks or retail within 15 minutes, our current street network is dangerous for cyclists due to the lack of safe infrastructure and most parks and retail spaces are not considered accessible by regional bicycle advocates. How was “Access” by bike defined and used in these calculations? 	<p>- Modification of Future Route 445</p> <p>Gillespie Field</p> <ul style="list-style-type: none"> <li>- Gillespie Field Trolley Station Relocation</li> <li>- New Bus Rapid Transit (BRT) Station</li> <li>- Marshall Avenue Intersection Improvements</li> <li>- BRT Routes (90, 870, &amp; 890) Modifications</li> </ul> <p>Cross Border Xpress</p> <ul style="list-style-type: none"> <li>- SR 905/Britannia Interchange Capacity Increase</li> <li>- Britannia Road Widening</li> <li>- Siempre Viva Road Widening</li> <li>- Local Bus Route (661) Modifications</li> </ul> <p>As such, the Airport Authority requests that the 2021 Regional Plan clarify whether these AMAP-identified priorities will be implemented or have been substituted with alternative implementation options.</p>	<p>Rapid 235 transfer to Commuter Rail 582 Escondido to San Diego International Airport/ITC via I-15 Rapid 235 Escondido to Downtown San Diego Rapid Express 280 Escondido to Downtown San Diego Transfer to Airport Express McClellan Palomar Airport to San Diego International Airport via I-5Commuter Rail 398 (Coaster) Oceanside transfer at Central Mobility Hub APM</p> <p>McClellan Palomar Airport to Poinsettia Coaster Station</p> <p>Rapid 440 Carlsbad to Escondido via Palomar Airport Road Cross Border Facility to Otay Mesa &amp; Iris Ave Trolley Rapid 638 Iris Trolley to Otay Mesa Rapid 950 Otay Mesa POE to Imperial Beach via 905 Commuter Rail 582 Central Mobility Hub to US Border Commuter Rail 583 National City to US Border El Cajon Gillespie Field Trolley to UTC Rapid 870 El Cajon to UTC via Santee El Cajon Gillespie Field Trolley to Sorrento Mesa Rapid 890 El Cajon to Sorrento Mesa via Santee</p>
L344	<p>Another recommendation in the Airport Transit Plan is the transition of MTS Bus Route 992, which is currently the main transit connection to the Airport, to a Rapid Bus service. It also suggested that combining the new Rapid 992 with other Rapid bus routes, such as the 215 along the El Cajon Boulevard corridor and 235 along the Interstate 15 corridor, could improve airport transit ridership by better linking to major regional destinations and by increasing single-seat access to the San Diego International Airport.</p> <p>As such, the Airport Authority requests that the 2021 Regional Plan assess the potential ridership benefits from upgrading MTS Bus Route 992 to a Rapid service and extending other existing and planned Rapid routes to serve the SAN terminal areas.</p>	<p>SANDAG will take this recommendation under consideration.</p>
L345	<p>Figure 2.4 (Page 27) in the Draft Plan identifies regional mobility hub areas that could accommodate this increased demand for jobs, housing, shopping, and recreation, while being served by expanded transit networks. In the Airport Authority's initial review, it appears that many of these hub areas are in close proximity to airports.</p> <p>As such, the Airport Authority requests that the 2021 Regional Plan ensure that new incompatible land uses are not introduced near airports, as outlined in each ALUCP. The Draft Plan's Environmental Impact Report should also formally assess any land use conflicts with the applicable ALUCPs. Important factors include:</p> <ul style="list-style-type: none"> <li>- Limiting new noise-sensitive development within an airport's noise contours and ensuring that any new noise-sensitive development includes sound insulation limiting the number of people in areas subject to the highest risk of aircraft accidents</li> <li>- Assuring aircraft safety and preserving airport operations by limiting the height of new structures and objects</li> </ul>	<p>The land use pattern proposed in the 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth and not precise locations for future housing development or housing unit type. The exercise of land use authority is reserved to local jurisdictions.</p>
L346	<p>Page 21 in Appendix Y states that "when combined with the rate at which trucks produce emissions per day, neighborhoods in close proximity to the airport are put at a higher [air quality] risk" without citing any environmental impact study to substantiate this conclusion.</p> <p>The Airport Authority has ensured that current and future emissions from the San Diego International Airport's activities are included in the most recent 2020 State Implementation Plan (2020 SIP) for attaining air quality standards in the San Diego region under the federal Clean Air Act. The 2020 SIP determined that SAN's emissions can be accommodated without causing the region to experience additional exceedances of criteria pollutant standards.</p>	<p>We have clarified the narrative in Appendix Y and cited CalEnviroScreen 3.0 for community pollution exposure and vulnerability data.</p>
L347	<p>Figure 2.10 in Appendix Y is an outdated map of SAN, which doesn't properly reflect the airport property boundaries and onsite aeronautical uses.</p>	<p>We have replaced the outdated map with the Regional Location Map included in the San Diego International Airport Airfield Improvements and Terminal 1 Replacement Project Draft Environmental Assessment, released in June 2021.</p>
L348	<p>Page 78 in Appendix Y includes statements that air cargo operations are constrained due to limited airport space for expansion.</p> <p>As identified in its 2013 Northside Improvements Environmental Assessment, the Airport Authority is proposing a new SAN Northside Cargo Development project. The project would include a consolidated as expanded apron to accommodate additional cargo aircraft parking.</p> <p>Additionally, the Airport Authority opened a new 93,000-square-foot Airline Support Building on North Harbor Drive this</p>	<p>We have incorporated this updated information into Appendix Y.</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	year, which will allow for more efficient processing of bulky cargo items shipped in the bellies of passenger jets. Approximately 15% of SAN's freight volumes are transported as "belly cargo."	
L349	<p>Page 78 in Appendix Y relies on the outdated 2009 Destination Lindbergh Study to estimate SAN's air cargo capacity and identify cargo operational deficiencies.</p> <p>The FAA approved the most recent SAN aviation activity forecast in June 2019, which is publicly available at <a href="http://www.san.org/plan">www.san.org/plan</a>. The forecast anticipates that the number of cargo aircraft operations (i.e. takeoffs or landings) will increase by nearly 71% by 2050, even with the Airport's single-runway configuration.</p>	We have incorporated this updated information in Appendix Y.
L350	On page 20 in Appendix C, the Draft Plan states that its model relies on airport passenger survey data from 2008 to estimate airport-related travel patterns and demands on local and regional transportation facilities. The Airport Authority notes that ground access characteristics have changed dramatically over the last decade, especially with the introduction of rideshare companies. The Airport Authority also noticed that the modeling appears to be based on SAN aviation activity forecasts that were developed in 2013 (Figure S.18 in Appendix S). As previously stated, the FAA approved the most recent aviation activity forecast in June 2019, which is publicly available at <a href="http://www.san.org/plan">www.san.org/plan</a> . The new "constrained demand scenario" forecast estimates that SAN will serve approximately 20.3 million enplaned passengers in 2050.	<p>SANDAG appreciates you bringing to our attention new data that we can incorporate for future airport operations. We will incorporate the new aviation activity forecast in a post-Regional Plan version release of the activity-based model.</p> <p>While the current airport model was updated to include new ground access modes such as TNC usage, we will also be incorporating new survey data for the airport during the Central Mobility Hub study including calibration to the latest ground counts.</p>
<b>San Diego County Taxpayers Association</b>		
L351	What assumptions (i.e. debts service and length of projects) are going into estimating costs in YOE dollars?	The Cost Estimation Methodology and Funding Strategies for the RTP were presented to the SANDAG Board of Directors on March 21, 2021, Item No. 8B. This report and presentation described the various funding assumptions developed for the draft 2021 Regional Plan. The entire Board meeting can be found at <a href="http://www.sandag.org">www.sandag.org</a> .
L352	All existing TransNet funding has been claimed by currently running projects. How is the \$15 billion in TransNet funding estimated? Is the \$15 billion based on the assumption that San Diego voters will approve of a new extension to the program in 2024? How much of the \$15 billion relies on the assumption that there will be TransNet revenue between 2048 and 2050?	<p><i>How is the \$15 billion in TransNet funding estimated? - See Appendix V for methodology. The \$15 billion is in YOE dollars.</i></p> <p><i>Is the \$15 billion based on the assumption that San Diego voters will approve of a new extension to the program in 2024? – Yes.</i></p> <p><i>How much of the \$15 billion relies on the assumption that there will be TransNet revenue between 2048 and 2050? - There is an estimate of \$1.5 billion for 2049 and 2050 in YOE dollars.</i></p>
L353	Is the Quarterly TransNet Forecast a reliable source for estimating revenue from the Transportation Development Act (TDA) even though there have been observed "small differences" in TransNet and TDA growth rate? Is TDA growing faster than TransNet, or is it the other way around?	From FY 2002 to FY 2020, on average <i>TransNet</i> growth has been just 0.2 percentage point higher than TDA. Therefore, SANDAG considers <i>TransNet</i> as a reliable source to estimate future TDA revenue in the long-term.
L354	Has the growth of General Fund/Miscellaneous Local Road Funds been linear historically? Are you assuming that they will continue to be linear (why or why not)? If the 5-year average growth in these funds is 2.7, how did you derive a 3% growth during the period of the 2021 RTP implementation. Is this a weighted average or an average of averages across jurisdictions?	The 5-year average is 2.7%, however, the 10-year average is 6.6% in the initial review of these funds. With additional information related to one more year of data, it revealed that the 10-year average was 3.6%. SANDAG believed it would be best to be conservative with these funds and assume an average of 3% growth that is consistent through 2048. This growth rate is linear as it should encompass the extreme highs and lows that accompanies this particular fund source.
L355	How much of the value capture estimate (2.7 billion) relies on the estimated value of Central Mobility Hub Enhanced Infrastructure Financing as opposed to existing agreements and programs?	59%
L356	What is the Managed Lanes Feasibility Tool mentioned in Appendix V? What model or data did SANDAG use to estimate the \$22 billion from FasTrak revenue?	The Managed Lanes Feasibility Tool is an interactive dashboard model developed by SANDAG's consultant, HNTB, that can be used to forecast managed lane performance and revenues. It has been used by agencies around the country to inform implementation of Managed Lane projects, phasing, and the development of associated operational policies. When outputs from the tool are compared to data from Managed Lanes once they are built, it has been found to be very accurate. This tool was used to estimate the FasTrak revenues included in the Regional Plan. The methodology uses revealed preference data from existing operating managed lanes across the country that were specifically selected to be representative based on conditions found to be similar to facilities in the San Diego region. The model analyzes existing traffic and proposed lane configuration for the San Diego facilities that are included in the Managed Lane network to assign traffic volumes. It assumes a baseline volume must be reached before drivers will be willing to pay for the Managed Lanes. Usage of the Managed Lanes is predicted based on the overall level of demand above the baseline volume, available capacity in the Managed Lane, and remaining capacity in the general purpose lanes. It

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
		includes assumptions around high occupancy vehicle and clean air vehicle policies and discounts, traffic levels, growth rates, cost assumptions, lane capacity, toll rates and inflation.
L357	How did SANDAG achieve a passenger farebox recovery rate of 35%, and what is the basis of SANDAG's assumption that the recovery rate will be linear? Is the assumption that operating costs would be linear and that farebox recovery would follow the same linear growth? With proposed free fares, how will the estimated revenue be achieved?	Farebox recovery ratio is calculated by dividing the system's total fare revenue by its total operating expenses. Fare revenue is calculated by taking the ridership numbers that are generated through the Activity Based Model and multiplying them by the average fare. Operating costs grow by a Consumer Price Index of three percent annually. Each mode of transit has its own calculator for operating cost. Fare revenue does not grow at a linear rate. Ridership on routes changes based on new routes that come online, changes to land uses, and changes in the overall network. Free fares will be calculated with a subsidy given back to the operators to cover operating costs. Farebox recovery ratio should not change as a result but the amount of revenue subsidy will change.
L358	What will be the source of funding for reduced or free fares? Is it sales tax based?	Fare subsidies may be attached to sales tax measures but could be paid for by other sources as they become available.
L359	What source of revenue is each project listed in Appendix A tied to? If a source of revenue runs low, are there alternative ways to fund the projects associated with that source of revenue?	The project costs shown in Appendix A are related to the revenues explained and tabulated in Appendix V. Other than the revenues associated with the 2025 phased projects and programs, revenues sources are estimates based on future projections, coupled with historical information. If some of those future revenues don't materialize for any reason, it is not unreasonable to anticipate other (currently unknown sources) may take their place. A good recent example is funding received from Senate Bill 1 (SB 1) that was not previously anticipated and contributed to real dollars available to the region for transportation projects. However, if any future dollars do not materialize, and are not backfilled from other sources, future plans would need to be updated. These types of updates can easily be captured incrementally, given that the Regional Plan is updated every four years.
L360	What is the timeline for the development of each of the projects in Appendix A? Are delays in these timelines considered in the cost estimates?	The project development timeline for the projects listed in Appendix A varies but generally follows a 6 to 14 year window, depending on the project. These windows are inclusive of the planning/environmental/design and construction phases estimated for each project. For example, highway projects are estimated to be completed within 6 years once dollars are programmed and Rapid transit projects are assumed to have an 8 year completion window. These estimates are based on recently completed projects in the region.
L361	Have there been or will there be changes in the 2021 RTP to account for the impacts of the Covid-19 pandemic? Is SANDAG assuming that the effects of the pandemic on people's lifestyles and the economy will be short term? How do SANDAG's assumptions about the pandemic impact the RTP?	<p>SANDAG has been considering the impacts of the pandemic on transportation. This includes tracking traffic levels on major corridors in the region and conducting surveys of commuters and employers across the region to understand how the pandemic might change travel behavior in the future. As a result of this research, the 2021 Regional Plan assumes a much higher rate of telework. However only 39% of all occupations in the region are considered home workable. Also, the majority of employers in the region that expect to offer telework, reported that they will offer it on a part time basis to a portion of their employees after the pandemic. Therefor viable commute options will continue to be needed for the many commuters who have to travel to their job site.</p> <p>Also, a common misperception is that teleworkers don't drive much. Data from our own regional household travel survey as well as data from the national household travel survey demonstrates that teleworkers actually make more discretionary trips for shopping, leisure, and social purposes. This is why we are seeing traffic volumes at or above pre-pandemic levels on our major corridors despite the fact that we have more people teleworking. To reduce car traffic in the future, more viable alternatives to driving are needed. The 2021 Regional Plan proposes a variety of convenient travel options, including faster transit service and flexible fleet services, for all types of trips.</p>
L362	Are there technological assumptions as well in the RTP? Is the plan based on all current technology, or are there plans that are based on expected future technology? If some plans are dependent on future technology, how are you making sure that people will feel comfortable with using the new technology?	The 2021 Regional Plan accounts for advancements in technology and potential impacts to the transportation system. For example, the Flexible Fleets of today will evolve to be connected and autonomous. Industry projections vary but widespread deployment of shared, autonomous services is unlikely until 2035 or later. The 2021 Regional Plan lays out a strong backbone transportation network that will evolve and adapt as new technologies and demands change. As new and emerging technologies or Flexible Fleets become available, SANDAG will study, design, and test services to ensure they provide equitable, sustainable and inclusive options so all can benefit from the service.
L363	Have there been changes related to the 2021 RTP already? If so, is there any feedback from users? Please provide a detailed response.	Comments received on the 2021 Regional Plan and responses to each are documented in Appendix G of the proposed final 2021 Regional Plan. This appendix also notes when comments on the draft 2021 Regional Plan resulted in changes to the proposed final 2021 Regional Plan.

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L364	<p>What assumptions are made in the Transit Leap Capital Cost Estimate? Based on observed figures in the SF Bay Area, it seems that, for commuter rail alone, every mile requires \$1billion. How does \$55 billion for all Transit Leap capital costs break down into its modes? Answer to question 9 would probably address this if sufficiently detailed.</p>	<p>Estimating costs for Transit Leap considered development options for new commuter rail, light rail/Trolley, and Rapid improvements to existing transit services. Costs were developed using the Federal Transit Administration Capital Cost Database, which is intended for developing order-of-magnitude cost estimates for conceptual transit projects. The cost models are automatically adjusted to account for differences in regional cost levels between locations. The unit costs generated from the Capital Cost Database were compared with known actual project costs for the San Diego region, and they were adjusted as necessary. Capital transit projects include cost estimates for construction (both station and segment per mile), right-of-way acquisition, and other non-construction “soft” costs such as environmental review, planning, and design. The transit capital costs also include the costs of vehicles through the 30-year timeline of the 2021 Regional Plan.</p>
L365	<p>Since \$27.7 billion of the total estimated revenue will depend on the Regional Road User Charge, It seems that SANDAG is confident that the fee will be implemented in 2026. Why does SANDAG think that this fee would be popular among San Diego voters? Is the \$27.7 billion based on the assumption that every kind of vehicle will be charged? If the fee is not approved by voters, is there a source of revenue that would replace it?</p>	<p>The proposed final 2021 Regional Plan has been updated to reflect 2030 as the start of implementation for the road usage charge to better align with the timing that the State and other regions are expecting to transition to a road usage charge.</p> <p>Next year, SANDAG will study usage-based fees and the effect the fees will have on meeting established goals like greenhouse gas emissions reduction and improving equity for different income levels and different populations. The first phase of the study will calculate the true cost of driving a vehicle – the cost to own and operate a vehicle, the effect on road wear and tear, the cost of increasing capacity of the transportation system to meet demand, local and global pollution caused by both fuel powered and electric vehicles, traffic accidents, traffic congestion, and the cost of delays caused by congestion to the economy and to the quality of life of travelers. The study will determine how existing revenues currently funds different parts of the transportation system and how different populations are impacted. This foundational understanding will help SANDAG design a road usage charge program that encapsulates multiple factors to make it more fair across the community than the current transportation funding sources.</p> <p>The study will assess the potential impacts of user fees on San Diego residents, visitors, and businesses, particularly those relying heavily on transportation. SANDAG staff will consult with its Board of Directors, stakeholders, and community members to develop implementation strategies for a road usage charge. This includes policies such as who will pay what and how much, the fee structure, and the distribution of revenues. SANDAG is committed to developing a carefully constructed program that will ensure that no group, such as those driving fuel-powered vehicles, low-income individuals, rural residents, or those with long commutes, are paying more than their fair share. There are multiple mechanisms, such as caps and rebates, that will be explored to ensure a fair system.</p> <p>The road usage charge, which is being studied by both the federal and state governments, is being considered to replace an old tax system that is no longer relevant. We know this is a challenge and we respect the concerns raised. We are committed to having authentic dialogues to work through the challenges and create a revenue system that is flexible, sustainable, equitable, and fair to all. The intensive outreach and public participation process of the study will help design a system that appeals to San Diego voters. Many of the sources of revenue in the Regional Plan are uncertain, they are estimates that are developed with the best information we have available today. Some of these sources may not come to fruition, however there will also likely be new revenue sources available for transportation projects in the next 30 years that we cannot predict today.</p> <p>The revenue assumptions from the road usage charge in the Regional plan are based on an assumption that the fee would apply to resident trips, airport trips (SAN &amp; CBX), visitor trips, and cross-border trips. Trips that were not included are freight, non-freight commercial, and trips that come into or through the County. Which types of trips are subject to a road usage charge will be refined in future plans as additional work is done towards implementation.</p>
L366	<p>The total estimated revenue is about \$30 billion more than the total estimated expenditure (in YOE dollars) for the 2021 RTP. Where would the extra revenue go?</p>	<p>There are over 30 sources of funding included in the projected revenues for the 2021 Regional Plan. While the assumptions used to develop these revenues are determined to be reasonable based on state and federal standards, the level of projected expenditures provides flexibility to account for any changes in the timing or availability of these funds over the next 30 years.</p>
L367	<p>What is the assumption for increase in construction costs? What is the assumption for inflation? Do the construction cost estimates take into account both an increase in construction costs and inflation in the conversion to \$2020?</p>	<p>Increases in both construction and operating costs are tied to the inflation rate for the Plan which is an escalation rate of 1.93 percent annually applied (starting in 2021) from the 10-year moving average Engineering News Record (ENR) Los Angeles Construction Cost Index (CCI).</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

L368	Who participated in the peer review of your models and assumptions?	<p>The SANDAG Activity-Based Model 2+ (ABM2+) Technical Advisory Committee (TAC) included:</p> <p>Brian Gardner (Federal Highway Administration)            Caroline Rodier (University of California, Davis)            Joel Freedman (RSG)            Sherry Ryan (San Diego State University)            Wu Sun (San Diego Association of Governments)            Bayarmaa Aleksandr (Southern California Association of Governments) - 2020            Hsi-Hwa Hu (Southern California Association of Governments) - 2019            Bruce Griesenbeck (Sacramento Area Council of Governments)            Erik Ruehr (VRPA Technologies)            Guy Rousseau (Atlanta Regional Commission)            Joe Castiglione (San Francisco County Transportation Authority)            Lisa Zorn (Metropolitan Transportation Commission)            Maren Outwater (RSG)            Nagendra Dhaker (RSG)            Nesamani Kalandiyur (California Air Resources Board)            Tom Rossi (Cambridge Systematics)            Vladimir Livshits (Maricopa Association of Governments)</p> <p>The TAC panel meet in May 2019 and March 2020 regarding the ABM2+ model used in the 2021 Regional Plan.</p> <p>For the population and jobs forecast we conducted three external Peer Review meetings as follows:            March 2017</p> <p>Attendees</p> <p>Lynn Reaser, PhD, CBE Chief Economist; Point Loma Nazarene University</p> <p>Jeff Tayman, PhD Guest Lecturer, Demography and Economics, UCSD</p> <p>John Weeks, PhD Distinguished Professor Emeritus of Geography</p> <p>Erik Bruvold President, National University System Institute for Policy Research</p> <p>Dowell Myers, PhD Professor, Director, Population Dynamics Research Group</p> <p>Joe Salvo, PhD Director, Population Division, New York City Department of City Planning</p> <p>Ryan Ratcliff, PhD Associate Professor of Economics</p> <p>Stanley K Smith, PhD Professor of Economics; Research Demographer</p> <p>Steve Levy Center for the Continuing Study of the California Economy</p> <p>Ethan Sharygin, PhD Principal Demographer, California Department of Finance</p> <p>John Husing, PhD Primary Analyst, Economics and Politics, Inc.</p> <p>Ira Hirschman, Ph.D. Principal, Economic Services – U.S. Advisory Services</p> <p>February 2018</p> <p>Gary London- London-Moeder Advisors</p> <p>Frank Wen- Southern California Association of Governments</p> <p>Ryan Ratcliff- University of San Diego</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
		<p>Nathan Moeder- London-Moeder Advisors</p> <p>Ethan Sharygin- CA DOF</p> <p>April 2021</p> <p>Kirby Brady - City of San Diego</p> <p>Jeff Tayman - UCSD</p> <p>Gary London - London-Moeder Advisors</p>
L369	What is the time period when State Transit Assistance funding is expected to grow at 3% per year versus 5% per year? Is SANDAG's goal to encourage use of public transportation being considered in making assumptions about the growth rate of STA revenue?	STA funds are assumed to grow at a constant rate of 3% per year until 2035. The assumption then changes in 2036 to 5% annually to align with the possible increase in Diesel tax and further legislation similar to SB1. STA is determined from Diesel tax and does not rely heavily on increase in public transit.
L370	Does the State Highway Operations Protection Program only last for 10 years? When did it start, and, if it only lasts a decade, how will it be able support the 2021 RTP projects throughout their lifetimes?	The State Highway Operations and Protection Program (SHOPP) is an ongoing four year program funded by the state, with projects selected from the state's 10-year plan. This program was created by California Code 14526 in 1977 and is adopted every two years along with the State Transportation Improvement Program (STIP). The program is expected to continue unless there is a change to California State Law.
L371	How much of the Cap-and-Trade Revenue is, separately, from the Transit and Intercity Rail Capital Program, Affordable Housing and Sustainable Communities program, and Carbon Transit Operations program? Given that the Transit and Intercity Rail Capital Program and AHSC are competitive programs, how are revenues from these programs estimated through 2050? Is there a source that shows prior success in receiving the competitive funds?	The 2020 base year amounts are as follows: TIRCP \$31.28M, AHSC \$19.4M, and LCTOP \$5.15M. For TIRCP, the region received approximately \$31.278M/year on average from 2015-2020. This estimate assumes a 2% increase every year and a 10% increase every ten years starting in 2030. For AHSC, the region received approximately \$19M/year on average for the first three competitive cycles and assumes a 10% increase every ten years starting in 2030. LCTOP received is approximately \$5M/year since the first 2015 cycle estimated to increase 5% per year and is continuously appropriated from auction proceeds of Green House Gas Reduction (GGRF) funding and distributed based on the STA formula.
L372	What percentage of total revenues are assumed to come from competitive funding sources?	Competitive Fund sources are assumed to make up approximately 13% of the total plan revenue. Recent transportation legislation has seen a shift towards more competitive programs, so that amount could increase in the future, however SANDAG continues to compete well for funding both at a state and federal level due to our international border and major port status.
L373	Why are Motorist Aid Services mentioned twice as a source of revenue (once as state and once as local revenue)? Are they referring to different sources of revenue?	One program is state funded from the Freeway Service Patrol and SB1 funds and the Local program is funded from a \$1 annual fee on vehicle registrations.
L374	SANDAG assumes that the State FASTLANE will receive 20% of the state share of TCEP. In 2020, the revenue reflected 19% of the shares. How much does 1% represent in funding money? Also, what is the basis for the different growth rate estimates?	State FASTLANE assumes a 20% share of the state's 40% share of SB1 TCEP target which is \$300M/year. 40% of the \$300M/year is \$120M and 20% of that is \$24M/year in 2018. In 2019, \$24.5M is assumed and 2020 assumes \$25M/year after applying the 2%/year estimated growth rate. 1% of the \$25M estimate for 2020 represents \$250K. State FASTLANE growth estimates assume a combination of new revenues from SB1, state and federal funds, as well as the state's historic commitment to fund border projects, which is the reason for the different growth rate assumptions.
L375	How much of the \$2.8 billion in revenue estimate from State Managed Federal Programs come from each of the programs? What is the basis for the assumption that there would be additional revenue from Federal Highway Administration discretionary funds, and how much of the \$2.8 billion depends on it? What is the basis for each of the estimated growth rates?	<p>The programs included are the Highway Bridge Program and the Highway Safety Improvement Program. The State is assumed to use its portion of federal funds to supplement the funding for these discretionary programs. The funding is projected to be 74% for Bridge and 26% for Safety programs.</p> <p>As these programs are funded from federal formula funds, the growth rates were assumed to be the same as CMAQ/RSTP and other federal highway formula funds</p>
L376	What is the short-term growth rate of the Solutions for Congested Corridors program that funds the Road Maintenance and Rehabilitation Account?	There is no short-term growth rate for this fund source because it is an off-the-top, set amount per SB1 legislation.
L377	How much of the revenue from the Federal Transit Administration Formula programs go to Sections 5307, 5337, 5339, and 5310 each? What is the basis for the change in the growth rate of this revenue from 2% per year to 10% per six years?	As part of the FTA revenues, the calculation includes 5307, 5337 and 5339 only. The average split is 65% of 5307, 30% of 5337 and 5% of 5339. Based on past history of previous federal legislation the average annual increase of funding is 2% per year. The revenue assumptions include a 10% increase to account for new federal legislation which historically increases revenues substantially.
L378	What is the basis for the assumption that the growth rate of CMAQ and regional STP revenue will change from 5% annually to 10% per six years in 2030?	As new federal acts are approved, we assume a 10 % increase in funding to maintain buying power.
L379	What is the growth rate of the Federal Highway Administration Discretionary revenue before 2030? What is the basis? What is the basis of the growth rate estimation beyond 2030? What years are the estimates based on?	The estimates are based on the averages of actual grants received over the period of the grant programs (2011 - 2020). Due to the elimination of federal earmarks, there is an assumption the funding will double due to

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
		growth in the discretionary program funding. The growth rate assumes 5% in 2020 and remains flat until 2030. Starting in 2030, we assume a 10% increase every 6 years with the approval of new federal transportation legislation.
L380	How was the \$294 million in Grant Anticipation calculated?	The Grant Anticipation Notes are calculated from Mid-coast financial model that reflects actual issuance of GANs that occurred in 2018.
L381	The San Diego Taxpayer Association submitted 6 tables with their comment letter requesting various revenue and cost estimate data and analysis. To view these tables, please see the full letter attached to this appendix.	The requested data would require additional transportation model runs and analysis that are beyond the scope of the Regional Plan.
L382	Are Ridehailing Company Service Fees anticipated to be on the 2024 ballot? Do ride hailing companies, separately, have to pay for the Road User Charge? What is the basis of the assumption that Ridehailing Company Service Fees would be popular among voters?	SANDAG will launch a study in the next year to further study the potential of usage-based fees and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. This study will also assess the potential impacts on businesses, particularly those relying heavily on transportation to do business. SANDAG staff will work with Board Members, stakeholders, and community members to develop implementation strategies for a road usage charge, including high level constructs of the program, such as who will pay, the fee structure, and the distribution of revenues. Whether Uber, Lyft, and food delivery drivers would be subject to a road usage charge, and if so, how it may impact the drivers and users of those services will be analyzed as part of this effort.
L383	Have other states been successful so far in transitioning to a Road User Charge?	A variety of states, in addition to California, are in various phases of piloting and deploying a transition to a Road Usage Charge, including Utah, Texas, and a Kansas/Minnesota joint effort. The state of Oregon is the furthest along, with their program called OReGO. Volunteer participants pay 1.8 cents for each mile they drive, and that money goes directly into the State Highway Fund. Starting in 2019, the Legislature authorized ODOT to allow unlimited OReGO participants. Drivers of fuel-powered vehicles can receive a credit for fuel tax and remote emissions testing, and drivers of electric vehicles are eligible for reduced registration fees.
L384	How is the growth rate of Regional Road User Charge revenue 2.7% until 2050 when the assumption is that more people will use transit, as opposed to personal vehicles, with the success of the 2021 RTP?	The road usage charge revenue assumptions were updated between the draft and final plan. The vehicle miles travelled (VMT) assumptions for the region show a decrease annually between 2040 and 2050. The per mile fee in 2020\$ for the Regional Road Usage Charge also decreases between 2030 (first year of implementation) of .033 cents per mile to .028 cents per mile in 2050.
L385	Which projects would be eliminated if Federal and State discretionary grants were not received?	The plan relies on a host of revenues from federal, state, and local sources. Without all three of these sources comingled together, SANDAG would lose the ability to build a multitude of projects and would dampen the ability to maximize local dollars to garner additional funds. Additionally, given that the Plan includes a 30-year planning period, it is possible that some sources could be swapped for others as state and federal priorities change.
L386	What projects would be impacted if the New Sales Tax and MTS Local Revenues measures do not pass?	The absence of new sales tax would impact all types of projects in the Regional Plan. Additionally, the lack of a sales tax measure for MTS would minimize the amount of both transit infrastructure and transit operations in the MTS service area.
L387	How do the Federal Transit Administration and CMAQ estimated growth rates reflect revenue from recent years?	<p>Federal Transit Administration (FTA) revenues increase by 2% on an annual basis which is consistent with historical increases. The Regional Plan assumes a new Federal Transportation Legislation Bill every 6 years which reflect past practices. With new legislation, it is assumed that revenues will have a one-time increase of 10% which has historically been the case.</p> <p>Actual apportionment for federal highway formula funds during the years of the FAST Act would have averaged a 5% increase per year, consistent with the plan estimated growth rates, except for a decrease in CMAQ funds as a result of reaching the end of the maintenance period for carbon monoxide attainment in 2018. That resulted in a decrease to our CMAQ apportionment in FFY 18/19, bringing the average to 4%. SANDAG does not foresee another decrease to CMAQ during the period of this plan so expects to see a continuation of the 5% increase per year.</p>
L388	What is the impact of reduced VMT on revenues from fuel taxes and tolls. Is this accounted for?	<p>SANDAG's 2021 RP assumes the road usage charge will replace the gas tax revenue lost by the move to fuel efficient and zero emission vehicles.</p> <p>For example, if a regional agency estimated receiving \$1 million in 2020 from the gas tax, then in 2030, they could have estimated receiving \$500,000 from the gas tax, and \$500,000 from a road usage charge.</p>
L389	Current Transportation Development Act (TDA) funds are currently used to support existing transportation services and state of good repair capital projects. Are the \$7.6 billion TDA revenues in Appendix V existing TDA revenues or new sources of TDA revenues?	The TDA established two funding sources: 1) Local Transportation Fund (LTF) and 2) State Transit Assistance (STA). The \$7.6B in TDA revenues shown in Appendix V is based on these two existing fund sources.

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L390	Where can we find the “2021 Regional Plan Transit Operations Costing” Excel workbook mentioned in Appendix U?	Costing files are located in our SD Forward Data page at: <a href="https://sdforwarddata-sandag.hub.arcgis.com/">https://sdforwarddata-sandag.hub.arcgis.com/</a> .
<b>San Diego Transportation Equity Working Group (SDTEWG)</b>		
L391	<p>1. A Regional Plan that Prioritizes environmental justice: Demonstrate environmental justice (EJ) communities are a priority by identifying projects that will improve their access to public transportation by 2025. These primarily low-income communities of color face the most pollution in the San Diego region and rely most on transit. The projects should include the development of a Safe Routes To Transit strategy and an early action project Mobility Hub at Euclid Transit Center.</p> <p>Recommendation: Include an equity specific project list as part of Appendix A: Transportation Projects, Programs, and Phasing document that provides all details including the expected project completion year. Response: Pull from 10 transit lifelines</p> <p>2. Youth opportunity Passes (YOP): Provide no-cost transit passes for all youth ages 24 and under to build generations of lifelong transit riders and connect youth to school, work, internships, and early career opportunities.</p> <p>Recommendation: Amend the Plan to explicitly state that transit fare subsidies will be allocated to fund no-cost transit for youth ages 24 and under. The plan currently lacks a commitment to no-cost passes for this age group.</p> <p>3. Bus service every 10 minutes: Make bus service reliable and affordable now– we can’t afford to wait. Buses are one of the most cost-effective ways to get us where we need to go while cutting climate pollution. We need immediate solutions while big infrastructure projects are being built.</p> <p>Recommendation: Projects TL63, TL64, and TL65 on page A-52 of Appendix A, should include cost and bus frequency improvement details to demonstrate they will be prioritized, particularly those planned to be completed 2025. Simultaneously, only one of all the Transit Leap projects within the South Bay to Sorrento Corridor has a 2025 year implementation. The Transit Leap rapids listed on page A-12 through A-14 that will service environmental justice communities should be prioritized for a 2025 completion. Finally, MTS should be included as an agency to collaborate as part of the partnerships listed on page B-3 of Appendix B and near-term actions for the implementation of bus frequency enhancements.</p> <p>4. Blue Line express: Build a 24-hour Express Blue Line. The Blue Line already has the highest ridership and is one of the best-performing transit lines in the region. However, it is overcrowded, has limited frequency, delayed connections, and no 24-hour service.</p> <p>Recommendation: The RP needs to outline clear construction of an additional track that can provide express 24- hour service. Currently, the project details fail to demonstrate that a third track will be implemented. According to project description TL13 on page A-14, a Blue Line (San Ysidro to UTC, Double/Third tracking and Grade Separations at Taylor/Ash) are planned for a 2050 implementation.</p> <p>5. 24-hour service: By 2025, provide 24-hour service on popular transit routes to connect workers to their destinations. Participants in San Diego’s MTS community engagement efforts ranked this as their highest priority.</p> <p>Recommendation: Project ID TL63, TL64 and TL65 should include bus frequency increase to 24 hours. As well as all the Transit Leap projects within the South Bay to Sorrento that will service environmental justice communities.</p> <p>6. The Purple Line:</p>	<p>1. The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.</p> <p>2. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p> <p>3. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>4. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</p> <p>5. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>6. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study.</p> <p>7. The proposed final 2021 Regional Plan supports the electrification of the region’s transit buses and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>8. Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan.</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>Fund the planning, environmental, engineering, and construction work for the Purple Line as a rail line that connects environmental justice communities in central City Heights and the South Bay to Sorrento.</p> <p>Recommendation: The detailed ridership analysis of the Purple Commuter Rail alignment listed on page A-15 is promising and points to a purple line that will include stations in City Heights. The RP should include project phasing that prioritizes the development of stations in central City Heights and the South Bay region with a 2035 project completion.</p> <p>7. An all-electric bus fleet by 2030: Accelerate the electrification of buses, because our communities cannot afford to wait 20 years to breathe cleaner air and reduce climate pollution.</p> <p>Recommendation: The transition to zero-emission buses, including rapid routes, should be accelerated for a 2030 completion with the support of recently approved state and federal funding sources. Page A-53 outlines program investments for Zero-Emission Buses and Infrastructure. The funding should be redistributed to prioritize the program’s implementation to meet the 2030 completion goal.</p> <p>8. Anti-displacement strategies: Protect low-income communities of color living near transit corridors from gentrification with proactive strategies that include building affordable housing while preserving naturally occurring affordable housing, community ownership, and tenant protections. We need comprehensive solutions!</p> <p>Recommendation: We commend SANDAG for including a Regionwide Displacement Study for near-term implementation. The study is listed on page B-3 of Appendix B and should be completed before the adoption of the RP in order to truly inform and prevent displacement due to the plan’s implementation.</p> <p>9. Restroom access: Create a plan to make restrooms available to the public and provide MTS with funding for a clean and accessible restroom network with access at all major transit stations.</p> <p>Recommendations: Include restroom access as an item in the capital operations budgets. The 2021 Regional Plan states that “mobility needs to be widely accessible, affordable, easy to use, and tailored to a person’s individual needs. In short, mobility must be viewed as a basic human right”. State-of- the-art bathrooms are mobility and key to a successful transit system.</p> <p>10. Emergency-ready transit system: Provide transit for environmental justice communities to evacuate during emergencies. EJ communities are more vulnerable to climate disasters and more likely to live near industries, military operations and other dangerous activities that may have accidents that cause fires, leak toxins, and other crises.</p> <p>Recommendations: Include a study and implementation strategies to establish an emergency-ready transit as part of the near-term action in Appendix B within the Social Equity Planning Framework section.</p>	<p>SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p> <p>9. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p> <p>10. MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.</p>
L392	<p>Finally, the SDTEWG strongly recommends that SANDAG develop an equity pricing program, a Next OS equity plan, and policies that safeguard the privacy of Black, Indigenous, People of Color (BIPOC). The SDTEWG supports the efforts to implement a regional pricing strategy and the Next OS as long as they are implemented with an equity framework, which is not reflected in the Draft RP. All regional pricing strategies must include mechanisms to protect low-income families who cannot afford to pay to be able to drive. All Next OS infrastructure should give development priority to environmental justice communities. And, policies must be in place to ensure data collected does not target BIPOC or use the information to over-police our communities.</p>	<p>SANDAG will launch a study in the next year to further study the pricing strategies and their capabilities in addressing various goals, including equity and greenhouse gas emissions reduction. SANDAG advances planning on technology initiatives such as Flexible Fleet pilots, Next OS, Mobility Hubs, equity will continue to be a priority for SANDAG.</p>
<p><b>San Diego Transportation Equity Working Group (SDTEWG) - Supporting Organizations</b></p>		
L393	<p>The RP should include EJ specific solutions to be completed by the year 2025. The climate emergency is here and frontline communities cannot continue to wait for relief. The RP is a visionary document by nature, however, it must outline immediate benefits to improve the region’s economy, quality of life and sharply reduce air pollution and GHGs in most climate-impacted communities.</p>	<p>1. The 2021 Regional Plan has been developed with equity at the forefront. An equity specific project list has been included in the Draft 2021 Regional Plan Appendix H. As suggested, this list of projects with</p>

	<p>10 Transit Lifelines Summarized Descriptions</p> <p>1. A Regional Plan that Centers Environmental Justice: Prioritize environmental justice (EJ) communities by identifying projects that will improve their access to public transportation by 2025, which should include the development of a Safe Routes To Transit strategy and an early action project Mobility Hub at Euclid Transit Center.</p> <p>2. Youth Opportunity Passes (YOP): Provide no-cost transit passes for all youth ages 24 and under to build generations of lifelong transit riders and connect youth to school, work, internships, and early career opportunities.</p> <p>3. Bus Service every Ten Minutes: Make bus service reliable and affordable now - we can't afford to wait. Buses are one of the most cost- effective ways to get us where we need to go while cutting climate pollution.</p> <p>4. Blue Line Express: Build a third track for a 24-hour Express Blue Line. The Blue Line already has the highest ridership and is one of the best-performing transit lines in the region.</p> <p>5. 24 Hour Service: Connect late-night and early-morning workers by 2025. Provide 24-hour service on popular transit routes to connect workers to their destinations.</p> <p>6. The Purple Line: Fund the planning, environmental, engineering, and construction work for the Purple Line as a rail line that connects environmental justice communities in central City Heights and the South Bay to Sorrento Valley.</p> <p>7. An All-electric Bus Fleet: Accelerate the electrification of buses, because our communities cannot afford to wait 20 years to breathe cleaner air and reduce climate pollution.</p> <p>8. Anti-displacement Strategies: Protect low-income communities of color living near transit corridors from gentrification with proactive strategies that include building affordable housing while preserving naturally occurring affordable housing, community ownership, and tenant protections. We need comprehensive solutions!</p> <p>9. Restroom Access: Create a plan to make restrooms available to the public and provide MTS with funding for a clean and accessible restroom network with access at all popular transit stations.</p> <p>10. Emergency-ready Transit System: Provide transit for environmental justice communities to evacuate during emergencies. EJ communities are more vulnerable to climate disasters and more likely to live near industries, military operations and other dangerous activities that may have accidents that cause fires, leak toxins, and other crises.</p> <p>We urge the SANDAG Board to support the 10 Transit Lifelines and ensure their inclusion in the 2021 RP.</p>	<p>phasing will be added to Appendix A in the proposed final 2021 Regional Plan. Thank you for the suggestion and SANDAG agrees that this change will make it easier for the public to understand.</p> <p>2. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.</p> <p>3. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p> <p>4. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</p> <p>5. The proposed final 2021 Regional Plan includes increased service spans for the Trolley and bus service up to 20 hours per day. As SANDAG and the transit agencies move into more detailed planning efforts in the near future, some routes will be considered for 24-hour operation.</p> <p>6. The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</p> <p>7. The proposed final 2021 Regional Plan supports the electrification of the region's transit buses and the state's Innovative Clean Transit regulation. Appendices A and B include SANDAG's proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS' and NCTD's Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p> <p>8. Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG's housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
		<p>9. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations.</p> <p>10. MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.</p>
<b>SanDiego350 Transportation Committee</b>		
L394	<p>1: Reduce GHG emissions from cars and light trucks to fight the Climate Crisis.</p> <p>We ask you to meet bolder GHG emission reduction targets. Climate change is accelerating and its effects are devastating environmental justice communities. For our families and children to have a livable future we cannot wait any longer to respond.</p> <p>Transportation accounts for half of the GHG emissions in the San Diego region. The targeted 20% reduction per capita of GHG emissions from cars and light trucks below 2005 levels by 2035 will have only a small impact on the GHG emissions from transportation, even if we successfully reach that goal. The emissions reduction goal must be at least 50% by 2030.</p>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions to achieve state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan.</p>
L395	<p>To rapidly reduce GHG emissions, we ask you to accelerate the timeline for development and improvement of transit (trolleys, trains, and buses) and active transportation (biking and walking). Also, the plan must include effective strategies to encourage a rapid shift away from cars to public transit and from fossil fuel burning vehicles to zero-emission vehicles. Managed lanes on freeways should be implemented to enable buses to run faster and on-time and so that they are a more attractive means of transportation than cars.</p>	<p>The 2021 Regional Plan is focused on creating more mobility options to all people in the San Diego region through a fast, reliable and fair public transportation system and micromobility options including e-bikes and scooters, rideshare, and microtransit shuttles. The Regional Plan also proposes a network of managed lanes using existing infrastructure that provide priority access to people using transit, carpooling, or vanpooling.</p>
L396	<p>2. By 2023 or sooner, implement no-cost youth transit passes for those 24 and younger.</p> <p>This would advance social justice by helping youth, who often lack resources, to travel to education, employment, and services. This would immediately improve transit ridership numbers and contribute to transit being seen as a viable alternative to car travel.</p> <p>Youth passes are an investment in the success of transit, as youth who are accustomed to using transit become adults who will choose buses and trains over cars.</p>	<p>One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth under age 19.</p>
L397	<p>3: Improve the transit system now to make it more frequent, reliable, accessible, affordable and fast.</p> <p>The 2021 Regional Plan must prioritize improvements in public transit. We need a real alternative now in order to begin the transition away from cars without delay. The current transit system needs to improve by increasing passenger capacity, frequency and service hours on popular lines to make it more convenient, reliable, accessible, and fast. This means 24 hour service and 10 minute frequency on many popular bus routes currently in service. This should be done immediately to introduce the public to a new transit era by providing MTS and NCTD with the necessary financial support.</p>	<p>SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan.</p>
L398	<p>3: Prioritize the needs of Disadvantaged, Environmental Justice Communities.</p> <p>Disadvantaged, Environmental Justice Communities, which disproportionately suffer from the effects of climate change, cannot afford to wait; they need immediate improvements while long-term infrastructure projects are developed. This means not building new roads, accelerating the Purple Line, and collaborating with MTS and NCTD to make improvements to the Blue Line and Sprinter and add Bus Rapid Transit routes to serve those communities.</p> <p>We ask for the completion of the Purple Line via City Heights all the way to the border by 2035 instead of stopping in National City per the draft Regional Plan. That is because half of the Purple Line ridership will come from Chula Vista, Imperial Beach, and Tijuana. We also ask for enhancement to the Blue Line to reduce travel time from the border and South Bay region to downtown to provide faster access to the jobs in the downtown area.</p>	<p>The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</p> <p>Additionally, the South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	Road improvements such as grade separations at railroad crossings should be included in the plan to reduce traffic gridlock, congestion, and idling that cause air pollution and health problems.	<p>City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego.</p> <p>The proposed 2021 Regional Plan includes grade separations for the Orange, Green, and Blue Line Trolley in several locations.</p>
L399	<p>4: Transition to a Zero Emission Bus Fleet by 2030</p> <p>Fund the implementation of California’s Innovative Clean Transit rule. Our communities of concern suffer with high levels of toxic pollution and cannot wait 20 years to reduce toxic and greenhouse gas emissions. Investment in zero emission buses now will improve residents’ health and help people thrive in San Diego County. These actions taken now will save money in the long term. The scale of our ambitions must reflect the magnitude of the challenge. SANDAG must invest heavily in infrastructure to continue and accelerate that transition.</p>	<p>The proposed final 2021 Regional Plan supports the electrification of the region’s transit buses and the state’s Innovative Clean Transit regulation. Appendices A and B include SANDAG’s proposed commitment of \$75 million through 2025, \$250 million between 2026 to 2035, and \$332 million between 2036 and 2050 for zero-emission buses and infrastructure to accelerate the implementation of MTS’ and NCTD’s Zero Emission Bus (ZEB) Rollout Plans. Transit agency ZEB Rollout Plans are on the CARB website here: <a href="https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans">https://ww2.arb.ca.gov/our-work/programs/innovative-clean-transit/ict-rollout-plans</a>.</p>
L400	<p>5: Identify Anti-Displacement strategies:</p> <p>Develop an anti-displacement strategy that includes affordable/low-income housing and preservation of existing affordable housing, community ownership, and tenant protections as part of the comprehensive solutions for any possible impacts of new transit infrastructures. We ask SANDAG to provide an update on the status of the anti-displacement study.</p>	<p>Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues.</p>
L401	<p>6: Develop an Emergency Ready Transit System:</p> <p>There is a need for Environmental Justice Community residents to have an escape route from a community-wide emergency situation such as occurred recently in a ship fire at the Port. We ask for planning and implementation of a transit emergency response strategy that is fully funded. Communities of concern are most vulnerable to climate disasters.</p>	<p>MTS and NCTD work closely with the County Office of Emergency Services to ensure that transit vehicles can be used in the case of any public emergency. Additionally, SANDAG’s specialized transportation grant program requires all grantees to work with the County to get their wheelchair accessible vehicles registered to assist in emergencies. Appendix Q also describes emergency evacuation strategies, including signaling, traffic control guides, roadblocks and barricades, electronic signage, land expansion, contra-flow lanes, traveler information services, use of mass transit, and airport uses.</p>
L402	<p>7: World Class Transit System with Amenities</p> <p>We ask for a truly world class transit system that all members of our society and visitors, regardless of their age and physical condition, can use without hesitation. This requires amenities including clean bathrooms at major transit stations and hubs, electronic information on trolley, train, and bus schedules, routes, and transfer information, seats and sun shelters at all stations and stops, safety provisions for all transit users including persons with disabilities. These amenities would provide comfort and dignity to all transit riders.</p>	<p>The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. MTS is working to provide shelters throughout the region. Bus shelters are provided wherever there is sufficient right of way to locate them. Any new infrastructure build would include shelters. Complete Streets designs are an important component of SANDAG’s planning today and will be included on projects in the future. As part of larger infrastructure projects like Next Generation Rapid, Trolley and Commuter Rail, all stations will have shelters. A goal of the Next Operating System (Next OS) is to provide real time transportation updates about transit schedules and transfer information at travel kiosks and phone applications for travelers to better plan their trips.</p>
<b>Sierra Club San Diego</b>		
L403	<p>All aspects of the RTP are important, although consistent and reliable funding of the plan requirements are essential to achieving the RTP goals. The very backbone of RTP realization is early environmental mitigation, planned, funded and ready to be implemented within San Diego County. The same careful planning should include provisions for maintenance of the Multi Species Conservation Program (MSCP) and conserving Multiple Habitat Planning Areas (MHPA). Not only are these lands invaluable in their own right for the preservation of plant and animal species, they are essential to any Climate Action Plan due to their ability to sequester carbon.</p>	<p>The conservation of native species and their habitat is a key component of SANDAG’s Sustainable Communities Strategy. The land use pattern of the 2021 Regional Plan envisions greater compact development in areas served by high frequency, efficient transit. The result is less urban sprawl and less impacts to native habitat and species. Appendix AA Regional Habitat Conservation Vision of the Regional Plan describes the region’s efforts to develop and implement a system of open space for conservation of San Diego’s unique biodiversity. Additional information has also been added to Chapter 2 of the 2021 Regional Plan.</p>
L404	<p>This initiative for early environmental mitigation is expected to expedite the implementation of transportation projects and reduce the costs associated with mitigation or permit delays.</p> <p>To be absolutely clear, Sierra Club endorses the earliest possible environmental conservation, mitigation, or remediation. Any delays associated with Capital projects should not reflect on the mitigation capabilities of the environmental community or SANDAG.</p> <p>In the introductory section of the RTP numerous potential funding sources are provided. On the subject of funding, we are reminded of the fragility of transportation appropriations at the state and regional level. Gasoline sales tax revenue offers a lesson on the ephemeral nature of voter approved gasoline sales tax revenue increases. In this instance, cars and light trucks have simultaneously improved in miles per gallon along with the advent of increased electric vehicles (EVs)</p>	<p>Regional habitat conservation plans have been established by some of the local jurisdictions within the region. Participating jurisdictions that adopted a habitat conservation plan were provided the authority to impact (“take”) endangered species if they implemented the conservation provisions in their Plan. One of those provisions was to establish a regional funding source for habitat conservation. SANDAG does not have “take” authority, but has assisted the region by leveraging its funding to acquire critical habitat for the mitigation of regional transportation projects, providing stop gap funding for regional management and monitoring, and inclusion of regional funding into the 2016 Proposition A.</p>

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>both of which have contributed to a substantial reduction in gasoline sales tax revenue. This eye-opening shortfall at the state level reflects a local focus when evaluating ballot box funding. The San Diego region failed to fund the proposed 2016 Proposition A Transnet sales tax increase of one quarter cent, although vigorously supported by SANDAG and numerous environmental organizations. At that point SANDAG was left with the barest of funding options.</p> <p>This stark demonstration of the unreliability of voter support for tax increases should not be lost on SANDAG Board members. Reliance on temporary budget sources are unstable and insufficient if they are based on assumption of bond debt refinancing, stock market appreciation, population increases, or property or sales tax increases. Funding must be secured with initial and sustainable investments for a minimum of the first 10-years of the RTP approved environmental mitigation projects. Without such funded safety measures the RTP is confronted with speculative-by-nature “Revenue Assumptions”. The below italicized and bolded statements are taken directly from the RTP supporting documents.</p> <p>Appendix V: Funding and Revenues Assumptions The assumptions made for each major revenue source included in the Plan’s financial analysis are provided below. All revenues have been escalated to the year that dollars are expended, and they are based on the escalation factor appropriate for that specific revenue source. Additional details for each fund source also are included in Technical Appendix 1.</p> <p>By its very definition, the conjecture surrounding proposed long-term financing and funding is apparent in the fundamental terms Assumptions and Escalation, which indicate the uncertainty regarding this 29- year duration RTP. The SANDAG Board members must do everything possible to remove the associated uncertainty and doubts of reliable and assured revenue. This initiative for early environmental mitigation is the keystone to the RTP realization and must be securely funded upon SANDAG Board approval and initiation of the RTP 2050 Transportation Plan.</p> <p>“Without a regional funding source, the implementation—and ultimately, the success—of these plans to protect species and their habitats from extinction falls into question.” Regional funding:AA-6</p>	
L405	<p>The environmental community has repeatedly advised SANDAG staff and Board members that this SANDAG statement is clearly factual, warranted, and long predicted. It would behoove senior staff,</p> <p>under direction of the Board of Directors, to lobby for state and federal environmental grant funding or appropriations. The current, unprecedented state budget surplus is too great an opportunity to ignore in light of the devastating consequences of doing nothing for lack of funding and planning.</p> <p><a href="https://www.sandag.org/uploads/publicationid/publicationid_1236_5646.pdf">https://www.sandag.org/uploads/publicationid/publicationid_1236_5646.pdf</a> \$2.59 billion is the sum of potential grants from the year 2018 titled Transportation Funding in the San Diego Region. While this budget would be stunning news in the environmental community, this grant funding is only available for SANDAG’s CAPITAL projects. This would include new construction, expansion, renovation, or replacement projects for an existing facility, however there would be no mitigation funding for the environmental impacts of the new infrastructure or associated construction. It appears staff went to a great effort in meticulous searches to locate these CAPITAL grants. We request that staff accomplish the same depth of research for environmental mitigation and remediation grants. The rhetoric of “early environmental mitigation” will be far more convincing when SANDAG becomes a proactive source of grant funding information for San Diego’s NGOs. The equity chasm between Capital projects and the mitigation funding to initiate projects is breathtaking and unacceptable.</p> <p>“The estimated unfunded regional cost to implement the regional habitat conservation plans was \$3.0 billion.”</p>	<p>On January 28, 2011 the SANDAG’s Quality of Life Subcommittee discussed regional funding need for various infrastructure; habitat conservation was one of those discussed. The estimated funding need was \$3,083 million in 2010\$. <a href="https://www.sandag.org/uploads/meetingid/meetingid_2872_12391.pdf">https://www.sandag.org/uploads/meetingid/meetingid_2872_12391.pdf</a>.</p> <p>To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified \$2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a \$565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional \$300-\$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A).</p>
L406	<p>SANDAG Board members please compare this TransNet EMP land grant program to the CAPITAL projects multibillion dollar budget. To say the environmental community is “challenged” speaks to this massive funding and equity disparity. Please consider that in 2011 the deficit was \$3 billion. In 2021 the equivalent dollar shortfall is \$3.62 billion.</p> <p>“Allocation of \$4 million is done annually by the SANDAG Board of Directors pursuant to a two-year work plan. A portion of this funding is allocated and distributed through a competitive TransNet EMP Land Management Grant Program to maintain the integrity of existing regional habitat preserves through enhanced land management.”</p> <p>While the environmental community is grateful, \$4 million a year will require 75-years to catch up to 2011 environmental standards and funding deficit, to say nothing of funding the present Regional Habitat Conservation Vision:</p>	<p>Through SANDAG’s Environmental Mitigation Program (EMP), \$4 million dollars has been allocated annually to assist the region with land management and biological monitoring. The funding has established nine cycles of land management grants, the development of the management strategic plan, regional monitoring and the establishment of the San Diego Management and Monitoring Program (SDMMP).</p>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	A steady, secure regional funding source is needed to complete the land acquisitions as proposed and to provide for ongoing land management. San Diego Forward: The 2021 Regional Plan AA-10	
L407	<p>Simply stated, SANDAG’s PROTECT, RESPECT and CONNECT current environmental theme will largely remain a slogan until funding becomes a serious SANDAG Board of Directors priority. As San Diego’s premier and leading planning organization, the environmental community is mystified by the seeming lack of Board direction for the required environmental reviews and mitigation for CAPITAL projects.</p> <p>When developing the Regional Habitat Conservation Vision, several barriers were identified that have slowed efforts to fully address regional habitat conservation within the region, including a lack of ongoing secure regional funding, a lack of institutional knowledge and public awareness, and waning political focus on habitat conservation.</p> <p>Similarly, the focus on habitat conservation as a major public policy issued (SIC) has waned since the 1990s. Public policy focuses on imminent issues. Over the years, environmental public policy has shifted towards stormwater issues and climate adaption as the top-of mind issues. Ironically, habitat conservation contributes towards resolving each of these issues. In some respects, regional habitat conservation is a victim of its own success; being perceived as an issue that has been resolved by the region without an understanding of the current gaps.</p> <p>As we evaluate potential funding for existing conserved lands, MSCP Preapproved Mitigation Areas (PAMA), defined reserves, preserve and managed properties, it becomes abundantly clear that there are no planned funding objectives of substance for the San Diego Region’s natural lands. Natural lands protection is currently limited to \$4 million. This defect is delineated in the void of conservation funding in Appendix U: Cost Estimation Methodology of 18 different forecast costs budget totaling \$163,536,000,000. In this unprecedented budget no funds are planned for maintaining MSCP conservation lands and the required mitigation for Capital projects. <a href="https://sdforward.com/docs/default-source/2021-regional-plan/appendix-aa---regional-habitat-conservation-vision.pdf?sfvrsn=bb44fd65_2_AA-4">https://sdforward.com/docs/default-source/2021-regional-plan/appendix-aa---regional-habitat-conservation-vision.pdf?sfvrsn=bb44fd65_2_AA-4</a></p>	<p>To assist the region to meet its habitat conservation goals, the proposed final 2021 Regional Plan has identified \$2,087 million for an enhanced habitat conservation, management, and monitoring program. These funds are complemented with a \$565 million Nature-Based Climate Solutions Program that will promote both habitat conservation and restoration and carbon sequestration (See Climate Adaptation and Resilience programs). In addition, future mitigation of the transportation projects included in the 2021 Regional Plan will result in an additional \$300-\$500 million of land acquisition and restoration for habitat mitigation (incorporated in project costs presented in Appendix A). In total, the proposed final 2021 Regional Plan identified \$3 billion for habitat conservation efforts.</p> <p>SANDAG is committed to working with its regional partners to identify funding to fulfill this commitment.</p>
L408	The TransNet Environmental Mitigation Program (EMP) also established the San Diego Management and Monitoring Program (SDMMP) to provide a coordinated, scientific approach to management and biological monitoring of conserved lands in San Diego County. Appendix AA, addressing The Regional Habitat Conservation Vision contradicts the illusion of effective planning by the \$3.0 billion funding deficiency from 2011 to date. Essentially, the natural lands preservation budget is bereft of new funding sources, relying exclusively on the existing \$4,000,000 per year of the original TransNET sales tax funding.	As described above, the proposed final 2021 Regional Plan identifies \$3 billion for habitat conservation efforts. SANDAG is committed to working with its regional partners to identify funding to fulfill this commitment.
L409	<p>Without a regional funding source, the implementation—and ultimately, the success—of these plans to protect species and their habitats from extinction falls into question. In 2011, the estimated unfunded regional cost to implement the regional habitat conservation plans was \$3.0 billion. This SANDAG RTP statement could not be more timely or appropriate for discussions and decisions to cure the unfunded regional cost. Hesitation to address funding requirements accomplishes nothing. Sierra Club can only speculate on the huge shortfall confronting SANDAG and the San Diego region environment the RTP claims to safeguard. The 2011 deficit in today’s dollar value would be \$3.62 billion and climbing.</p> <p>The bottom line of this Sierra Club communication, is that the RTP plan does not address the on-the-ground reality of SANDAG acting as though the agency did not bear planning responsibility for the huge, and growing, natural land MSCP conservation and preservation costs. Instead, regardless of environmental mitigation first claims, SANDAG has devoted their economic resources solely to CAPITAL projects, disregarding the costs of maintaining already preserved and reserved MSCP lands and mitigating the carbon associated with these capital projects.</p>	As of September 2021, SANDAG has provided \$161 million towards acquisition of lands for capital project mitigation, \$55 million for regional land management and monitoring, and \$16.6 million of Land Management grant funds.
L410	With a \$196 billion California budget passed, it is inappropriate that the entirety of San Diego’s MSCP conserved and MHPA protected lands are hobbled with a \$4 million spending limit. SANDAG must exert the same efforts researching state and federal environmental protection grants or state appropriations as it demonstrates with the vastly more expensive CAPITAL project grants.	Thank you very much for your comment.
<b>Teresa Montero</b>		
L411	I have been a Logan Heights resident (OR BUSINESS OR NON PROFIT) for 10 years. I live 1 blocks from Interstate 5 writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego’s Barrio Logan and Logan Heights communities. Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan (Draft Plan)	Caltrans District 11 has also expressed interest in exploring opportunities for freeway caps. In alignment with the 2021 Regional Plan, SANDAG and Caltrans District 11 are currently developing Comprehensive Multimodal Corridor Plans in coordination with agency partners and local city governments. Comprehensive Multimodal Corridor Plans (CMCPs) are data-driven plans to reduce congestion and generate transportation choices while preserving community character and creating opportunities for enhancement projects. Opportunities for freeway caps will be considered in the CMCPs.

Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
	<p>Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950’s and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know ReConnect Logan Freeway Lid will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the 1-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.</p> <p>As mentioned, the construction of the 1-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950’s our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that 1-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children’s access to neighborhood schools. It is time for our community to heal - a freeway lid is the answer.</p> <p>Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out ReConnect Logan Freeway Lid as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are: The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)</p> <p>Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)</p> <p>Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)</p> <p>Besides being in line with the 2021 Draft Regional Plan, ReConnect Logan Freeway Lid is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to the addition of a Freeway Lid as a priority project as identified in SANDAG’s 2021 Draft Regional Plan.</p>	
<p><b>University Professional and Technical Employees - CWA 9119, Local 9 UCSD</b></p>		
<p>L412</p>	<p>While the Regional Plan is the boldest that SANDAG has proposed in decades, it is still highway first, which perpetuates a state of structural immobility, and will take too long to create necessary changes for public transit to be an alternative to cars and address our climate crisis. As transportation accounts for 41% of greenhouse gas emissions in San Diego, we have the opportunity to greatly reduce GHG emissions and create a more socially equitable region, by improving our transit system.</p> <p>Therefore, I urge you on behalf of the SDTEWG to support these proposed changes:</p> <ol style="list-style-type: none"> <li>1. Meet the required greenhouse gas emission targets, and ensure measures actually get us to those goals, by using the federal and state funds available to create high quality union jobs. Climate change is accelerating and we are currently seeing the results, which is especially devastating to frontline communities, so the emissions reduction goal of 40% by 2030 is inadequate to meet the climate crisis.</li> <li>2. Accelerate the timeline for all transit (trollies, buses, rail) and biking infrastructure improvements and prioritize the Environmental Justice communities that need transit solutions the most. Environmental Justice communities cannot afford to wait; they need immediate improvements while the long-term infrastructure projects are being planned. This means no new roads but rather accelerating the purple line and collaborating with MTS to make improvements to the blue line, both of which serve these communities.</li> <li>3. Develop a transit system that is fast, frequent, reliable, and accessible by increasing passenger capacity and frequency on popular lines. This should be done immediately to introduce the public to a new transit era by providing MTS and NCTD with the necessary financial support for implementation.</li> <li>4. Create and fund an anti-displacement strategy to protect vulnerable communities living near transit corridors by developing new affordable housing, preserving existing affordable housing, encouraging community ownership.</li> <li>5. Make immediate improvements to current amenities surrounding transit stops with dedicated funding. Amenities</li> </ol>	<p>The 2021 Regional Plan is required to reduce greenhouse gas (GHG) emissions from passenger vehicles and light-duty trucks by 19% per capita by 2035 compared to 2005 levels, as mandated by Senate Bill (SB) 375. Reducing GHG emissions and achieving state goals related to carbon neutrality requires actions at all levels of government. SANDAG looks to support and encourage local jurisdictions, state agencies, and other partners to reduce emissions beyond what is included in the 2021 Regional Plan. The Blue Line Trolley is one of the most successful light rail lines in the nation. It recently had frequencies increased to 7.5 minutes from 5 a.m. to 7 p.m. Grade separations and track work will help to improve the reliability on the Blue Line. Appendix A includes specifics on these projects, but in the short term SANDAG will conduct a Blue Line Express Feasibility and Conceptual Engineering Study as a Near-Term Implementation Action (included in proposed final Appendix B: Implementation Actions). The study will focus the project specifications and clarify next steps for express connectivity along the Blue Line.</p> <p>The South Bay to Sorrento Comprehensive Multimodal Corridor Plan is currently studying alternatives that include a station in City Heights along the Commuter Rail Route 582. The east-west Commuter Rail route 581 between El Cajon and Downtown San Diego/Central Mobility Hub via SDSU includes that station in the current proposed alignment. The first part of Route 582, from National City to Sorrento Mesa, is expected to be built by 2035 and is planned to be extended south from National City, to Chula Vista, and to the border by 2050. An additional route, Commuter Rail 583, traveling from the border to National City on the same alignment as the 582, is expected to be built by 2050 along with a branch to the Central Mobility Hub via downtown San Diego. SANDAG agrees that action is needed now to provide fast, frequent, reliable, and accessible transit, especially on highly utilized routes. Staff are bringing forward an item to the SANDAG</p>

**Draft 2021 Regional Plan Responses to Comments – Letter Sourced**

ID	Comment	Response
	<p>include benches, shade from the elements, and bathrooms which should all be accessible according to ADA regulations. 6. Begin no-cost transit passes for youth 24 years old and younger in 2023, not 2027. No-cost transit passes encourage significant participation in public transportation and help shift expectations for how San Diegans use transit.</p>	<p>Transportation Committee and to the Board of Directors in advance of approval of the 2021 Regional Plan to amend the agency budget and act now to invest in transit that benefits environmental justice communities. This action seeks to increase services on transit lines that have infrequent service in the evenings and late nights, and/or provide fare subsidies for youth riders. Additionally, further clarification on planned improvements to the bus network, including frequency and span-of-service improvements, will be added to Appendix A in the proposed final 2021 Regional Plan. Land use authority is reserved to local jurisdictions – the cities and the county. The cities and the county are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan as those jurisdictions understand the unique needs of their communities and geographies. SANDAG is developing a Regional Housing Incentive Program and it will meet the goals of the proposed final 2021 Regional Plan. SANDAG’s housing incentive program will include development of a regional anti-displacement strategy, consider climate change and resilience, consistency with the transportation improvements included in the Regional Plan, and alignment with SANDAG grant programs. Additionally, SANDAG will coordinate with its Social Equity Working Group, tribal nations, and other interested stakeholders to ensure the housing incentive program promotes equity and addresses gentrification, displacement, and other issues. The proposed final 2021 Regional Plan includes a commitment to building bathrooms at all new rail stations and developing a bathroom access plan to study the incorporation of bathrooms into existing stations. MTS is working to provide shelters throughout the region. Bus shelters are provided wherever there is sufficient right of way to locate them. Any new infrastructure build would include shelters. Complete Streets designs are an important component of SANDAG’s planning today and will be included on projects in the future. As part of larger infrastructure projects like Next Generation Rapid, Trolley and Commuter Rail, all stations will have shelters. One of the Implementation Actions listed in Appendix B is a Regional Fare Impact Study. This study will ensure public stakeholders get the chance to weigh in on the options. The study, expected to be completed by FY2024, will include an evaluation of fare subsidies for people with low incomes, seniors, students, and youth. While that work is underway, staff from SANDAG, MTS, and NCTD are working with stakeholders on a one-year pilot that may provide free fares for youth age 18 and under.</p>
<p><b>Urban League of San Diego County; LISC San Diego; People's Association of Justice Advocates; National Black Contractors Association</b></p>		
L413	<p>We are very concerned that the plan does not address both AB 686 Affirmatively Furthering Fair Housing and Sustainable Communities Strategy as interpreted by the California Air Resource Board (CARB) “to reduce greenhouse gas emissions from driving, which can also foster healthier and more equitable and sustainable communities.”</p>	<p>The 2021 Regional Plan, including its Sustainable Communities Strategy and the Regional Housing Needs Assessment (RHNA) Plan, meets state-required greenhouse gas emission reductions while also improving social equity.</p>
L414	<p>SANDAG through the 2021 Regional Plan has an opportunity under AB 686 and the CARB 2018 Progress Report to begin the process of ending the current legal apartheid that exists in our communities and ensure that California meets its greenhouse gas emissions reductions targets for 2030 and beyond with how communities are “planned, funded, and built.” We strongly urge SANDAG to use their role as the Metropolitan Planning Organization and with the 2021 Regional Plan to comply with AB 686 and Sustainable Communities Strategy to encourage and assist cities like the City San Diego to begin desegregating their neighborhoods and provide meaningful opportunities for all residents and families while lowering car emissions and climate change.</p>	<p>As described in Appendix K – Regional Housing Needs Assessment, State law (Government Code Section 65584(d) and 65584.04(e)) requires the Regional Housing Needs Assessment (RHNA) Plan to further five objectives related to (1) housing supply, (2) infill development, (3) jobs/housing relationship, (4) equity, and (5) affirmatively furthering fair housing, and requires that 12 factors be considered in the development of the methodology to allocate housing units. To promote equity and fair housing, as well as to meaningfully address patterns of segregation, the RHNA methodology allocates more housing units within each income category to jurisdictions with a percentage of households in that same category that is lower than the regional percentage. The Equity Adjustment in the methodology assists in overcoming patterns of discrimination and transforming racially and ethnically concentrated areas of poverty into areas of opportunity by allocating a higher proportion of low-income housing units to jurisdictions with a lower share of low-income households, which tend to be jurisdictions with a high concentration of resource-rich areas.</p>
L415	<p>Finally, we strongly urge SANDAG to create an Office of Equity that will ensure that proposals like the Regional Plan and are advancing equity and reducing barriers to inequality, structural racism while enhancing opportunity.</p>	<p>SANDAG has an Office of Diversity and Equity and the social equity analysis for the 2021 Regional Plan is included in Appendix H.</p>
<p><b>Webster Community Council</b></p>		
L416	<p>We see development of our region occurring as planned, as an impediment to our traditional lifestyle and as such, desire a more gentle approach to the conversion a sprawled California city to a high-density commuter city. The use of transportation agency owned parking lot lots next to noisy, government-owned, transit center facilities such as trolley lines is objectionable as is the obvious feeling that our automobiles are being taken away from us. Yes we believe in growth, but it must be phased to include our life styles. We request a plan that will be prepare our community to receive proposed changes occurring in the near future.</p>	<p>SANDAG will collaborate with community members, including the Webster Community, as the 2021 Regional Plan is implemented to ensure transportation solutions meet the needs of each unique community.</p>
L417	<p>Our voice is changing! We have a sophisticated community council who now has experienced the flawed logic of, “oh you are not ready,” for changes that are inclusive in the new modal plans. We ask for a mobility center/hub located</p>	<p>The Southeastern San Diego Mobility Hub area includes all three Transit Leap service types - commuter rail, light rail, and Next Gen Rapid – anchored by a station near the community’s existing transit center and</p>

	<p>within our existing fledgling transportation center near the intersection of Euclid Avenue and Market Street. This together with communication and information system infrastructure requires fiber optic cable readiness equal to that of other San Diego communities. We ask for assurance that the community will be ready for the state of the art transportation system that is in the design stage at this time. At the very least we ask for an inventory of our existing transportation facilities to demonstrate how far we have been left behind. We want all of our streets to be designed with "Complete Streets" designs enabling all modes of transportation, including unshared bicycle paths where appropriate. We ask for coverings for all of our MTS bus stops.</p>	<p>commercial core. Also included in the regional mobility hub concept is the upgrade of streets to be safer for the use of micromobility, transit, and other alternative modes. Investments in supporting technologies related to transit and an array of mobility hub amenities is also included for this hub such as electric vehicle charging for Flexible Fleets, safe passenger loading areas, and upgraded transit waiting experience inclusive of real-time travel information, comfortable waiting areas, WIFI, and device charging options. All of these improvements will ensure the community is both physically and digitally connected to available travel options.</p>
<b>County of San Diego (Attachments)</b>		
<a href="#">L418</a>	<a href="#">County staff would be interested to better understand and discuss further with SANDAG the potential for Regional Plan strategies to be used as part of a potential regional mitigation strategy related to Vehicle Miles Traveled (VMT).</a>	<a href="#">SANDAG looks forward to coordinating with the County on opportunities for Regional Plan strategies to be used as part of a potential regional mitigation strategy related to VMT.</a>
<a href="#">L419</a>	<a href="#">When would funding be expected to be implemented related to Transit Leap/Flexible Fleet Connections to Mobility Hub areas, as this is a potential opportunity to reduce VMT for residents living in the unincorporated area?</a>	<a href="#">SANDAG has already begun on efforts to implement many elements of the 2021 Regional Plan with funding that is currently available. Appendix B describes the near-term and continuing actions to implement the Regional Plan.</a>
<a href="#">L420</a>	<a href="#">The County has developed an Electric Vehicle (EV) Roadmap and is committed to assisting with the deployment of regionwide EV infrastructure to reduce GHG emissions in the transportation sector. Could SANDAG provide additional details on the future development, application, and implementation of the proposed Road User Fees and other proposed road usage revenues? Will consideration be given to exemptions for use of clean mobility strategies?</a>	<a href="#">The funding strategy for the 2021 Regional Plan assumes that the road usage charge would be applied to both gas-powered and zero-emission vehicles, however, the details of implementation of the road usage charge will be further explored in a pricing implementation strategy that SANDAG will begin developing in 2022.</a>
<a href="#">L421</a>	<a href="#">County staff would like to discuss with SANDAG staff the Regional Plan strategies, including funding for Major Transit (for purposes of CEQA, defined as a rail transit station, ferry terminal served by bus or rail, and a bus stop with two or more lines that provide transit service at 15 minute intervals or better during peak commute periods) in areas of the unincorporated area that are identified as "VMT efficient" in the SANDAG VMT Map.</a>	<a href="#">SANDAG looks forward to discussing major transit stops and associated CEQA implications with County staff.</a>
<a href="#">L422</a>	<a href="#">There is significant investment in development and infrastructure in the Otay Mesa area, and Otay Mesa is identified as a "Mobility Hub" area in the RTP. County staff would like to better understand what funding has been identified for this "Mobility Hub" area.</a>	<a href="#">Appendix A identifies funding for Mobility Hub amenities at a regional level and does not define specific investment on a per hub basis. Appendix A includes specific investments for the Central Mobility Hub and San Ysidro Mobility Hub as those are specific transit station projects with Mobility Hub infrastructure.</a>
<a href="#">L423</a>	<a href="#">County staff would like to discuss with SANDAG the potential for "Major Transit" services along the I-15 corridor, such as the potential for buses on shoulders.</a>	<a href="#">Appendix D (Figures D.10 and D.11) show the 2035 and 2050 Transit Priority Areas, which cover a ½ mile buffer from major transit stops. There are major transit stops included in the I-15 corridor associated with the Rapid bus service in that corridor.</a>
<a href="#">L424</a>	<a href="#">Complete Corridors, such as the SR-67 and I-15 Corridors, are envisioned to act as the backbone of the regional transportation system. In addition to providing for safe and comfortable spaces to get around for all modes of transportation, road improvements such as intersection widening are important for the safe and reliable movement of all road users. County staff would like to discuss further identification and investment within complete corridors that provide linkages to the unincorporated area. These improvements could assist in providing routes for the County's eastern and northern rural regions that could be essential in the event of accidents or fire evacuation. For example, County staff would like to discuss with SANDAG the option of including safety improvements along the SR-67 Corridor on Wildcat Canyon Road, as this road is a relief route to SR-67. Additionally, road improvements on Old Hwy 395 and Pala Temecula Road in the north county may merit further conversation, as both of these roads serve as alternate routes to I-15 during peak traffic hours.</a>	<a href="#">The 2021 Regional Plan identifies technology and operational improvements to SR-67 to improve safety. During corridor-level and project-level planning, SANDAG will coordinate with the County on the specifics of these improvements.</a>
<a href="#">L425</a>	<a href="#">County staff would like to further discuss improvements of low flow crossings that are necessary to limit area flooding as well as the safe passage of motorists.</a>	<a href="#">The 2021 Regional Plan acknowledges the need to address environmental effects, such as flooding, that currently occur and could be exacerbated by climate change. The details of these improvements will be defined during corridor-level and project-level planning.</a>
<a href="#">L426</a>	<a href="#">County staff would like to work with SANDAG to identify evacuation routes at a regional level, and the possibility of creating a separate section within the Regional Plan that would identify improvements of these routes and potential funding that could be part of the 2021 Regional Plan.</a>	<a href="#">Appendix A details the funding for rural corridors and how these improvements would support regional evacuation routes.</a>
<a href="#">L427</a>	<a href="#">County staff would like to discuss with SANDAG how Smart Infrastructure and Connected Vehicles will address the legal and financial challenges with sharing traffic signal data with private entities and the liability of the potential misuse of signal timing data.</a>	<a href="#">Appendix B details implementation actions for the Regional Plan, including Priority Implementation Action 6 to advance the Next OS by preparing technical and planning studies and initiating pilot opportunities. Near-term actions would establish policies for data sharing and cross-agency procedural guidelines. SANDAG will be working closely with the County on these actions.</a>
<a href="#">L428</a>	<a href="#">County staff would like to better understand the impact of Electric Vehicle Infrastructure on County of San Diego public right of way.</a>	<a href="#">SANDAG will continue to collaborate with the County of San Diego on electric vehicle infrastructure. The 2021 Regional Plan does not address details on electric vehicle infrastructure in County of San Diego public right of way.</a>

## Draft 2021 Regional Plan Responses to Comments – Letter Sourced

ID	Comment	Response
L429	<p>Stormwater Management &amp; Regional Needs Assessment; suggested edits in Appendix R, page R-2:</p> <p><u>"The County of San Diego has initiated an update of the 2010 Needs Assessment's 40- year water quality cost estimate using more recent water quality planning documents and strategies for achieving regulatory compliance and water quality objectives throughout the region. Since 2010, the Copermittees have worked to formulate Water Quality Improvement Plans (WOIPs) for the region's watersheds, including strategies, planned projects, and schedules to address their respective water quality objectives and compliance needs. The update to the Needs Assessment is intended to assist the County in planning and decision making and will draw upon the most recent WOIPs, with a focus on unincorporated areas to develop updated cost information."</u></p>	<p><u>Thank you for these suggested edits. These are incorporated in the proposed final 2021 Regional Plan Appendix R.</u></p>
L430	<p><u>Figure AA.1 shows the conserved habitat lands in the San Diego region (light green) and displays the areas included in the four subregional habitat conservation plans (subfigure).</u></p> <p><u>The Pre-Approved Mitigation Area (PAMA) of the South County Multiple Species Conservation Program (MSCP) and draft PAMA of the draft North County MSCP are labeled as "Proposed Conserved Habitat Lands" (dark green). This label may be misinterpreted by readers. While the MSCP Preserves will be assembled within the PAMA, not all PAMA designated lands will be conserved or are being actively pursued for conservation at this time.</u></p> <p><u>The draft Focused Conservation Area (FCA) of the draft East County MSCP was not included in the "Proposed Conserved Habitat Lands" (dark green). This area is equivalent to the draft North County MSCP's draft PAMA and should be included in this figure.</u></p> <p><u>The Rancho Guejito property located north of San Pasqual Valley Road will not be included in future iterations of the draft North County MSCP Permit Area. The portions of this property identified within the draft North County MSCP should be changed from dark green to white to reflect this change.</u></p> <p><u>In the subfigure, both the draft North County MSCP and Multiple Habitat Conservation Plan (MHCP) are identified by the number "4." The MHCP area should be identified by the number "1" to correspond with the provided key.</u></p>	<p><u>Thank you for these suggested edits to Figure AA-1. The figure has been updated accordingly.</u></p>
L431	<p><u>Although the draft 2021 Regional Plan mentions the importance of protecting habitat corridors and wildlife linkages through land acquisition, it does not appear to include the construction of safe passageways to connect wildlife to preserved lands bisected by existing and future regional transit corridors. It is recommended that SANDAG work with the San Diego Monitoring and Management Program (SDMMP) and community partners to identify the areas along regional transit corridors that would benefit from wildlife crossings and that these improvements be included in future regional projects.</u></p>	<p><u>Thank you for this recommendation. Appendix AA has been updated to reflect this suggestion.</u></p>
L432	<p><u>For proposed projects that occur adjacent to Department of Parks and Recreation (DPR) County-managed lands, DPR staff would like to coordinate with SANDAG staff to ensure wildlife connectivity is maintained from adjacent lands to preserved County lands, including wildlife-only crossings.</u></p>	<p><u>SANDAG looks forward to coordinating with DPR staff to ensure wildlife connectivity is maintained for those proposed projects adjacent DPR County-managed lands.</u></p>
L433	<p><u>For proposed projects that occur adjacent to or near existing or potential future trail connections, DPR staff would like to coordinate with SANDAG staff on trail connectivity throughout the County and incorporate safe multi-use crossings such as bridges or overpasses for recreational use.</u></p>	<p><u>SANDAG looks forward to coordinating with DPR staff on trail connectivity for those proposed projects that occur adjacent to or near existing or potential future trail connections.</u></p>
L434	<p><u>DPR staff request SANDAG staff coordinate in developing SANDAG's 5 Comprehensive Multimodal Corridor Plans as mentioned in Appendix B: Implementation near DPR facilities:</u></p> <p><u>Central Mobility Hub and Connections, Coast, Canyons, and Trails - State Route 52, North County - SPRINTER/Palomar Airport Road/State Route 78/State Route 76, San Vicente - State Route 67, South Bay to Sorrento - Purple Line/Interstate 805/Blue Line/Interstate 5 South.</u>  <u>Study additional seven corridors to inform the next Regional Continuing Actions.</u></p> <p><u>Pursue funding opportunities for projects, programs, and services identified in completed CMCPs.</u></p>	<p><u>SANDAG looks forward to the County's participation in developing the Comprehensive Multimodal Corridor Plans.</u></p>
L435	<p><u>County Staff would like to discuss with SANDAG the possibility of including trails and trail systems within the unincorporated area as part of the 2021 Regional Plan and to consider California Coastal Trail connections to DPR facilities.</u></p>	<p><u>As an implementation action of the 2021 Regional Plan, SANDAG will prepare a Regional Active Transportation Plan and will coordinate with the County of San Diego on the inclusion of trail systems.</u></p>
L436	<p><u>As the owner and operator for eight airports in the region, County Airports continues efforts to safely operate its facilities, ensure future land uses are compatible with aircraft operations, and protect the health and safety of people and property within the vicinity of an airport. The County's airports serve as transportation hubs, emergency service facilities and economic engines in their communities. McClellan-Palomar Airport is the only commercial airport in North</u></p>	<p><u>SANDAG looks forward to continuing coordination on the region's airport facilities with the County. "Appendix BB: Regional Aviation Strategic Plan (RASP) and San Diego Airport Multimodal Accessibility" in the 2021 Regional Plan discusses our regional airport facilities and includes the RASP Implementation Plan.</u></p>

ID	Comment	Response
	<p><u>County and has over 145,000 annual aircraft operations. It is also a Customs and Border Protection Port of Entry. In East County, Gillespie Field is the 44th busiest airport in the nation with 240,000 annual operations. Both of these airports support thousands of jobs and generate hundreds of millions of dollars in economic activity. The County looks forward to the integration of these airports into the regional transportation system.</u></p>	
<p><u>L437</u></p>	<p><u>The San Diego County Regional Airport Authority adopted Airport Land Use Compatibility Plans for the eight airports, which included land use compatibility policies related to airspace, noise, safety and overflight. Those policies have been adopted by the County of San Diego through its General Plan and Zoning Code. After evaluating the forecasted increases in housing and jobs around the Mobility Hubs, there are several land use assumptions related to safety and noise around Fallbrook Airpark, Jacumba Airport, Gillespie Field and McClellan Palomar Airport that County staff would like to better understand. For example, there are forecasted incompatible housing increases within the Runway Protection Zones at Gillespie Field. These inconsistencies could result in the assumed intensities and densities increases being unachievable.</u></p>	<p><u>The land use pattern proposed in the Draft 2021 Regional Plan focuses growth and development in the mobility hub areas. The allocation of housing units to subregional areas represents general areas projected for future growth and not precise locations for future housing development or housing unit type. The exercise of land use authority is reserved to local jurisdictions.</u></p>
<p><u>L438</u></p>	<p><u>The Regional Plan will focus future investment, development, and growth in centralized areas referred to as "mobility hubs." There are locations in the unincorporated area that the County has forecasted for future growth, which included already designated Regional Housing Needs Assessment (RHNA) sites, and are located within close proximity to a proposed mobility hub. The County would like to work with SANDAG to consider the expansion of proposed mobility hubs to include additional unincorporated north and east county communities. As indicated in Figure 1, these proposed expansions include areas in North County Metro, Lakeside, and Spring Valley. Additional details for these three mobility hub expansions are provided below.</u></p> <p><u>The North County Metro community is located between the proposed Vista and San Marcos mobility hubs. Expansion of the San Marcos mobility hub could include the Buena Creek Sprinter Station and additional housing units, including multiple RHNA sites.</u></p> <p><u>Lakeside has multiple areas that are identified as efficient areas compared to the regional vehicle miles traveled (VMT) average. These areas are located immediately adjacent to the proposed El Cajon mobility hub. Expansion of the El Cajon mobility hub could include these VMT efficient areas as well as potentially including additional growth areas in Lakeside along the I-8 corridor.</u></p> <p><u>Spring Valley is located east of the proposed Lemon Grove mobility hub and south of the proposed La Mesa mobility hub. This community has existing transit access along Jamacha Boulevard and is in close proximity to the MTS Trolley stations in Lemon Grove. Expansion of this mobility hub could include the Spring Valley areas near SR-125 and along Jamacha Boulevard.</u></p>	<p><u>SANDAG appreciates these suggestions from the County of San Diego and agrees that these are areas adjacent to the mobility hubs identified in the draft 2021 Regional Plan that should be considered as part of the identified mobility hub areas.</u></p>

Chair Catherine Blakespear and Board of Directors  
 San Diego Association of Governments  
 401 B Street, Suite 800  
 San Diego, CA 92101

**RE: Include Youth Opportunity Passes in the 2021 Regional Plan and Early Actions**

Dear Chair Blakespear and SANDAG Board of Directors:

We are excited for the future of transportation in our region. The 2021 Regional Plan includes visionary elements to building an efficient, accessible, and sustainable transportation system. Thank you for everyone’s effort on it. However, we bring to your attention that a key program is missing. We request that you amend the draft 2021 Regional Plan to include Youth Opportunity Passes (YOP), no-cost transit passes for youth ages 24 and under.

For 10 years, the Improving Transportation in City Heights Team (ITCH) has advocated to have no-cost transit passes for youth in San Diego. Mid-City CAN, the ITCH team, and the undersigned supporters request that you include YOP (ages 24 & under) in the 2021 Regional Plan. YOP requires a spot among to priorities in our 30-year vision for transportation in the region.

We ask the Board of Directors to take the following actions:

1. Amend the 2021 Regional Plan to state that Youth Opportunity Passes, no-cost-transit passes for youth ages 24 and under, will be funded when transit subsidies are allocated.
2. Amend the 2021 Regional Plan to state that transit subsidies will be allocated at the earliest implementation possible.
3. Fund Youth Opportunity Passes (24 & under) as an early-action Transit Pilot Program this year.

YOP (24 & under) is a necessary program, as illustrated by the following facts:

1. **Transit-dependent youth have been disproportionately impacted by the COVID-19 pandemic.** In San Diego County, there are approximately 86,000 young workers (ages 16-24) who work in the industries that were hard hit by the COVID-19 epidemic.<sup>1</sup> The industries include hospitality, food services, retail, oil and gas mining, transportation, employment services, travel, and leisure.<sup>2</sup>
2. **YOP (24 & under) is a way to increase ridership and develop a transit-culture.** Only 10,463 youth (ages 16-24) use public transit in San Diego, but these young commuters use public transit at a rate double that of their older counterparts (adults ages 25-59).<sup>3</sup> YOP will further promote transit use among young San Diegans.
3. **YOP (24 & under) helps divert youth away from the school to prison pipeline.** MTS officers decide who to check for fare evasion, YOP prevents the criminalization of youth of color due to their inability to afford a pass. Literature suggests that Black youth are arrested for fare evasion at a rate 5 times higher than their white peers and Latino/a/x youth are arrested at a rate 4 times higher than their white peers.<sup>4</sup>
4. **YOP (24 & under) promotes the reductions of GHGs.** A person who switches from a 20-mile round-trip commute by car to using existing public transit, can reduce his or her annual CO2 emissions by 4,800 pounds per year.<sup>5</sup> Decreasing greenhouse gas emissions is a matter of equity. Residents in low-income, BIPoC communities are exposed to more pollution than their more affluent counterparts. For example, City Heights residents are exposed to twice the amount of diesel particulate matter from trucks & cars than La Jolla residents.<sup>6</sup>
5. **YOP (24 & under) addresses climate justice.** Mid-City CAN has conducted 250+ conversations with residents in Communities of Concern (CoC). Over 86% of residents noted that climate change directly impacted them. Extreme weather has become a barrier to work and school for CoC residents who already face significant barriers to education and employment. Residents who normally walk or bike to work must increasingly rely on

cars or public transportation that is inaccessible due to cost or distance. YOP eliminates the cost barrier to transportation for youth ages 24 and under.

6. **YOP (24 & under) is a proven program.** Similar programs exist in Alameda County, Los Angeles, Sacramento, San Francisco, and Santa Ana. Youth Opportunity Passes helps ensure youth from all background are connected to their schools, internships, medical care, and early-career opportunities.

Amend the 2021 Regional Plan to include Youth Opportunity Passes (24 & under). Upon your commitment to include no-cost transit for youth ages 24 and under in the Plan, a study may be conducted to begin its implementation. But the community needs a commitment from you TODAY. It's been 10 years of advocacy. Thank you.

**Re: Support Incorporating *Reconnect Logan, 5 Freeway Lid Project* in the San Diego Association of Governments' (SANDAG) 2021 Regional Plan**

Dear Mr. Ikhata,

My name is Andrew Puls and my wife and I have been Logan Heights residents for approximately five years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego's Barrio Logan and Logan Heights communities. **Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan (Draft Plan)**

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know *ReConnect Logan Freeway Lid* will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out *ReConnect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, *ReConnect Logan Freeway Lid* is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to **the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.**

If you have any questions, you may contact me at [andypuls@gmail.com](mailto:andypuls@gmail.com).

Sincerely,

Andrew Puls

Subject: 2021 Regional Plan Comment SeanEloRivera@sandiego.gov

Dear Mr. Hasan Ikhata, Executive Director

Thank you for providing the public and businesses with the opportunity to comment on the draft Regional Plan. Our business, ARCO AMPM, is located in the City Heights community adjacent to the I-805 Freeway Home Avenue Ramps.

My team members and I daily observe the traffic patterns along Home Avenue and particularly the stacking on the I-805 ramps. We know the travel patterns of our customers at our fuel station and its convenience store. These experiences make clear that local neighborhood traffic is using longer less direct freeway trips to and from the Mt. Hope community and the Gateway employment and shopping centers. Buses, Bicycles, vehicles, and pedestrians cannot go directly Market Street. The Fairmount Park, Azalea Park and Hollywood Parks residents are cut off from the Gateway Centers jobs, visiting deceased loved ones at the Mt. Hope cemeteries, and the significant shopping areas between the I-805 and the SR-15 freeways. Our list of priority projects for our D9 /D4 are as follows:

1. Extension of the Home Avenue Route to Market Street for Pedestrians, Bicycles, and Vehicles. The Home / Market connection would provide significant economic development stimulus to the Mt. Hope and City Heights areas. It would assist in congestion relief by providing an alternate to freeway traffic on the SR 94 - Martin Luther King Freeway.
2. Completion of the Transportation markings along Home Avenue. Curbs are not marked for safety, to promote proper parking, traffic movement, and access for Buses and the Disabled. The Bicycle route is not fully painted and warning ramps for the visually impaired are not in place. Bulbing out at key intersections should be funded to increase pedestrian crossing safety.

I believe that the business community, along Fairmount and Home Avenues, would be open to establishment of a Business Improvement and Maintenance Area to assist in cooperative funding of some of these improvements. We would appreciate assistance in establishing such special districts. If you need further information feel free to contact me directly on my mobile 619-977-8485.

Respectfully,

Arkan Somo

President

[hasan.ikhata@sandag.org](mailto:hasan.ikhata@sandag.org)

Dear Mr. Ikhata:

California Air Resources Board (CARB) staff appreciate the opportunity to review and engage with the San Diego Association of Governments (SANDAG) staff on the draft Regional Transportation Plan/Sustainable Communities Strategy (RTP/SCS) known as "2021 Regional Plan." This work is more important than ever as CARB's first Senate Bill (SB) 150 report<sup>1</sup> evaluating progress meeting SB 375 goals showed that California is not on track to meet the greenhouse gas (GHG) reductions expected under SB 375 for 2020 and that vehicle miles traveled (VMT) are increasing. To achieve the State's climate mandates, California needs significant and immediate changes to how we plan, fund, and build our communities and transportation systems. SANDAG has demonstrated important leadership, creativity, and innovation in developing its draft RTP/SCS, and we appreciate your ongoing efforts to work with CARB and other State agencies.

The SCS plays a critical role in supporting the State's climate efforts, and local objectives to create an economically vibrant region that responds to the needs of its diverse communities and provides better access to jobs and cleaner air for its residents. We appreciate SANDAG's work to innovate beyond its previous RTP/SCS plan in considering how to better connect the region with a reimagined transportation system and incentivize growth in strategic areas, as well as its approach to increase public engagement in the plan development process.

In reviewing the draft RTP/SCS, CARB staff looked to identify whether additional information would be needed to conduct our final SCS GHG evaluation under SB 375. As discussed with SANDAG staff in meetings this spring and summer, for all third-round RTP/SCSs, like SANDAG's 2021 Regional Plan, CARB will focus on assessing whether GHG reductions are reasonably supported by the plan. CARB staff will conduct its final evaluation, as outlined in the Final Sustainable Communities Strategy Program and Evaluation Guidelines (SCS Evaluation Guidelines).<sup>2</sup>

---

<sup>1</sup> CARB's *2018 Progress Report: California's Sustainable Communities and Climate Protection Act*.

<sup>2</sup> CARB's *2019 Final Sustainable Communities Strategy Program and Evaluation Guidelines*.

CARB staff have identified areas where we would need additional information to complete our evaluation. We request that you include the information below as part of your SCS Submittal to CARB.

### **SCS Strategies to Reduce GHG Emissions**

CARB staff request that SANDAG provide further clarification regarding the following highlighted draft strategies to support CARB's assessment of whether the strategies are likely to be implemented as assumed, and therefore, reasonable for inclusion and credit:

- Land Use Pattern That Considers Jobs-Housing Balance, Mixing of Uses, Transit-Oriented Development and Housing Needs as Part of The Mobility Hub Framework: SANDAG's efforts to plan for and identify ways to incentivize future housing development in transit-rich areas with services and jobs, are vital to helping further State goals for climate, housing, and VMT reduction. CARB staff were able to identify actions in the draft RTP/SCS intended to support local jurisdictions in implementing the SCS land use pattern. As part of CARB's SCS Policy Commitments evaluation, CARB staff will also need to consider whether and to what extent these actions advance the region's land use vision. To support this analysis, CARB staff request that SANDAG provide information that summarizes differences between existing residential and commercial density and type assumptions in its Mobility Hub areas, compared to what is currently allowable in local land use plans for the corresponding geographies as part of its final SCS Submittal.
- Road User Charge Pricing Strategy: CARB staff notes that the draft RTP/SCS plans for a regionwide road user charge to be operational and generating revenue in the region starting as soon as 2026. CARB staff recognizes both the importance of, and difficulty in, implementing this pricing strategy. While the draft RTP/SCS includes actions committed to support implementation of this strategy (e.g., partnering on pilots, pursuing legislation, and investing in studies), which we support, they appear to be similar to those being pursued by other regions around the state that are assuming operations starting no sooner than 2030. CARB staff requests further clarification from SANDAG on how it may be able to implement sooner than others around the state as part of its final SCS Submittal.

### **Strategy Funding and Revenues**

The draft RTP/SCS identifies that \$29 billion needs to come from new funding sources in order to implement the plan through 2035.<sup>3</sup> Of those new funding sources, about \$18 billion, or 25 percent of the plan's total funding need through 2035, is attributed to new pricing strategies including *Ridehailing Company Service Fees*, *Future State Revenues for Transportation*, *Regional Road User Charge*, and *Future Federal Revenues for Transportation*. CARB staff is concerned that other strategies that contribute to the SCS meeting its targets

---

<sup>3</sup> See, SANDAG Draft 2021 Regional Plan (May 2021) Appendix V: Funding and Revenues, at page V-25.

may be at risk if the region is not able to fully secure these new funding sources within the timeline assumed in the draft RTP/SCS. CARB's evaluation will look at the extent to which the RTP/SCS strategies will be supported by existing revenue sources, as one measure of likely implementation. CARB requests that SANDAG identify whether and to what extent the high-impact strategies for achieving the GHG reduction targets in the plan are reliant on new revenue sources versus existing revenue sources as part of its final SCS Submittal.

### **Managed Lanes and Complementary Strategies**

CARB staff reviewed Appendix A of the draft RTP/SCS and appreciate the detail provided on the region's transportation project investments by corridor. CARB staff is encouraged to see that the draft RTP/SCS includes planned investments across modes within the region's key corridors and that when investing in roadway projects, the region is prioritizing conversion of existing free-flow lanes into managed lanes with priority access for transit, carpool, and vanpool users, and fee access for single-occupant drivers. CARB staff observe that the plan also includes some managed lane projects whose scope includes adding new lanes. Specific to those projects, CARB staff requests that SANDAG provide further information that contextualizes the risk, if any, to the region's ability to achieve, and maintain its 2020 and 2035 GHG targets when adding new lanes in those locations (e.g., clarifying whether and how those projects align with and facilitate the region's preferred land use pattern, identifying whether other policies or mechanisms that will limit adverse passenger vehicle GHG/VMT emissions impacts are present in those locations) as part of its final Submittal.

CARB staff looks forward to continuing our collaboration with SANDAG staff and are committed to working together on potential approaches to address these requests. If you have any questions, please contact me at [Lezlie.Kimura@arb.ca.gov](mailto:Lezlie.Kimura@arb.ca.gov).

Sincerely,

Lezlie Kimura Szeto, Manager

**RE: San Diego Forward – Draft 2021 Regional Plan Coastal Commission Staff Comments**

To the Honorable Board:

Thank you for the opportunity to review and provide comments on the Draft 2021 Regional Plan (Regional Plan). The Coastal Commission is an independent state agency that regulates development along California's coastline to protect natural coastal resources and to maximize coastal access and recreation for all. We have a long history of partnership with Caltrans, SANDAG, and other state, regional, and local agencies on transportation issues along California's coastline, often also in partnership with local county or city governments. Through these partnerships we are striving to provide a safe and resilient transportation network along California's coastline that also protects and enhances coastal natural resources and public access.

As an initial and overall comment, we want to applaud this document and the important direction it sets on multiple policy issues. Coastal Commission staff specifically appreciate the acknowledgement that bold changes to San Diego's regional transportation network and compelling alternatives to driving alone are needed to meet greenhouse gas (GHG) emission targets. The Regional Plan will provide a key blueprint for reducing transportation air pollution and greenhouse gas emissions (GHGs), minimizing vehicle miles traveled (VMT), improving multi-modal transportation, addressing the need for greater equity in transportation systems, and enhancing the resiliency of our transportation network in the face of climate change, particularly with respect to sea level rise and our coastal highways. We primarily want to offer ourselves as a partner in this important work to carry forward the Regional Plan. In this letter, Commission staff would like to offer a few broad comments on how the Regional Plan could be modified to strengthen its consistency with the California Coastal Act.

***Consistency of the Regional Plan with the California Coastal Act***

Overall, the policies of the California Coastal Act that guide our work at the Coastal Commission significantly overlap with the goals of SANDAG's Regional Plan, including policies to protect marine and coastal land habitats, concentrate urban development, maximize public access and expand multi-modal transportation, reduce VMT, and improve coastal resiliency to sea level rise and other climate-change hazards. For example, Appendix B: Implementation Actions identifies eight 2035 goals drawn from the Regional Climate Action Planning Framework which generally align with the referenced Coastal Act policies:

- "High density, transit-oriented housing" aligns with the Coastal Act policy of focusing development in or near existing developed areas (Coastal Act Section 30250).
- "Conserve open space and agricultural lands" aligns with Coastal Act policies related to conservation of sensitive habitat, open space, and coastal agricultural lands (Coastal Act Sections 30230, 30231, 30233, 30241).

- "100% of new buses are zero-emission," "400,000+ electric cars on the road," "Sustainable freight (transitioning to zero emissions where feasible)," and "Up to 100% renewable electricity" aligns with the Coastal Act requirement that new development minimize energy consumption and VMT and be consistent with requirements imposed by an air pollution control district or the State Air Resources Board on each particular development (Coastal Act Section 30253).
- "Walkable and bikeable communities" aligns with Coastal Act policies promoting the protection, addition, and enhancement of public access (Coastal Act Sections 30210, 30212.5, 30252).

Appendix B additionally identifies strategies for the implementation of affordable housing, such as minimum zoning near transit, fee-waiver programs, and accessory dwelling units, which align with Coastal Act Sections 30213 (Lower Cost Overnight Accommodations) and 30013 (Environmental Justice). However, there are aspects of the Regional Plan that could be strengthened to be more consistent with the Coastal Act as described below.

### ***Implementation and Prioritization***

Consistent with Senate Bill (SB) 375, the California Air Resources Board (ARB) sets targets for reduction of GHG emissions from passenger vehicles for the target years 2020 and 2035, which Chapter 2, "Sustainable Communities Strategy," notes the Regional Plan will accomplish. However, as noted in the Regional Plan, Executive Order B-30-15, and California Senate Bill 32 (Pavley, 2016), set a further statewide goal of reducing California's GHG emissions to 40 percent below 1990 levels by 2030 and the Executive Order B-55-18 set a statewide goal of carbon neutrality by 2045. Recognizing the needs of all residents and visitors to the San Diego region, the Regional Plan rightfully includes improvements to all transportation modes, including roads and parking, but in order to meet or exceed the referenced GHG and climate goals, projects that improve public transit and active transportation to minimize VMT should be completed as quickly as possible, consistent with the Coastal Act (Section 30253). Additionally, active transportation projects that provide emission free transportation options and can be implemented relatively quickly should be prioritized, including completing segments of the California Coastal Trail and Coastal Rail Trail in the near-term (2025) rather than in future phases (2035 or 2050). Specifically, trail segments providing access to major employment centers that would relieve strain on coastal access corridors and that would help relieve congestion on Interstate 5, such as the segments connecting Carmel Valley to Roselle Canyon; Del Mar to Sorrento; and Roselle Canyon/UTC to Rose Canyon, should be prioritized for near-term construction. In general, Coastal Commission staff support greater proportions of investment in transit, active transportation, and environmental enhancement projects as compared to roadway improvements targeting single-occupant vehicles.

Finally, the Coastal Act (Section 30250) encourages new residential, commercial, or industrial development, to be located within, contiguous with, or in close proximity to, existing developed areas. Accordingly, the Regional Plan should prioritize transportation investments which encourage jobs and housing to be concentrated in developed areas and avoid further encroachment into habitat, farmland, and open space recreational areas by moving them forward to earlier construction phases.

### ***Public Access and Recreation – Emphasize and Fund the California Coastal Trail***

A pillar of the Coastal Act is the protection and provision of public access to and along the coast. Coastal Act Sections 30210 and 30212 require that maximum opportunities for public access and

recreation be provided in new development, consistent with public safety, private property rights, and natural resource protection. Additionally, Section 30252 dictates that new development should maintain and enhance public access through such actions as facilitating transit service, providing non-automobile options, and providing adequate parking.

Given that beaches and coastal resources are major destinations in the San Diego region, the Regional Plan should maximize access to the coast, including expanded investments in bicycle and pedestrian routes. The proposal to dedicate 55% of the anticipated \$163 billion in funding over the next 30 years to capital improvements to the transit system will improve public access to and along the coast, and is supported by Commission staff, but projects that specifically facilitate access to beaches and coastal areas from the inland portions of the region should be expedited, as well as options for enhancing connections to public transit, the California Coastal Trail (CCT), the Coastal Rail Trail, and other visitor-serving recreational opportunities. Implementation of the Regional Plan would make significant improvements to the regional bike network, most notably in terms of Class I corridors and in coastal communities that will enjoy enhanced coastal access as a result of these improvements. Coastal Commission staff support these improvements as well as further network and infrastructure enhancements for active transportation, such as widened sidewalks in areas without designated bike lanes, increased funding for bicycle parking and locker facilities, and bicycle-specific signaling integration on local arterials and feeder streets.

Coastal Commission staff acknowledge and appreciate the inclusion of updated information regarding the completeness and deficiencies in the San Diego region's portion of the California Coastal Trail in the 2021 Technical Addendum to Appendix W: California Coastal Trail. The addendum should also reference the recent work of the California Coastal Commission, California Department of Transportation, and Coastal Conservancy in developing an ArcGIS-based mapping tool that identifies all complete and incomplete segments of the Coastal Trail and classifies them according to trail type, identifies land ownership, and identifies features, such as individual stairways and pathways. The most recent update to the CCT mapping effort is outlined in the [California Coastal Commission Memorandum Re: California Coastal Trail Mapping Project, April 2021](#). In light of these improvements to the available data and SANDAG's identification of large portions of the CCT that are still in need of completion, a stronger emphasis on pedestrian and bicycle improvements necessary to complete the trail should be provided in Chapter 3 and a stronger and more specific funding commitment for the CCT should be provided in Appendix A: "Transportation Projects, Programs, and Phasing." Specifically, a portion of the funding identified for "Local Streets and Roads" (9% of the Regional Plan expenditures) should be allocated to funding the completion of the CCT.

Further, Commission staff encourage the integration of data related to weekend peak traffic in the planning phase of projects with potential impacts to congestion on major coastal access corridors used to access weekend recreation, such as Interstate 8, Interstate 5, and Pacific Coast Highway. Commission staff encourage SANDAG to implement enhanced transit alternatives where weekend coastal access will be significantly affected.

### ***Environmentally Sensitive Habitat Areas and Marine Resources***

Coastal Commission staff suggest that the Regional Plan include specific reference to Coastal Act Chapter 3 policies requiring the preservation of coastal resources, as well as specific language concerning the importance of protecting and restoring the region's urban canyons, coastlines, beaches, and water resources. Transportation corridors within the San Diego region bisect or are located directly

adjacent to sensitive marine resources including coastal bluffs, streams, lagoons, and the Pacific Ocean. Many of these coastal systems have already been impacted by historical transportation infrastructure development and additional impacts to these resources are restricted by Coastal Act policies. Except for certain specific instances, fill of a wetland or other coastal waters is prohibited (Section 30233), and the marine resources (Section 30230), water quality (Section 30231), and environmentally sensitive habitat areas (Section 30240) often associated with the coastal environment are also protected.

### ***Planning for Climate Change and Sea Level Rise***

In addition to requiring new development to minimize VMT, Coastal Act Section 30253 requires that new development minimize risks to life and property from hazards and assure stability and structural integrity without the use of a shoreline protective device. Understanding the potential impacts of climate change and sea level rise (SLR) is of critical importance when beginning long-range planning efforts and evaluating projects that may be at risk from coastal hazards. Given the proximity of key regional infrastructure to the coast, it is imperative that transportation and land use plans carefully anticipate the effects of SLR and associated hazards. Ensuring that new coastal infrastructure is designed to adapt to the effects of SLR throughout the expected life of the infrastructure is a principal concern of the Coastal Commission, as clarified through the [Commission's Sea Level Rise Policy Guidance](#), which was most recently updated in November 2018, and through recent local government vulnerability assessments and planning efforts related to climate change. In recognition of the importance of this subject, many state directives, guidance documents, and regional planning documents have called for SLR to be included in planning processes.

- [Safeguarding California](#) (2018), the state's climate adaptation strategy, recognizes that "Climate change impacts from SLR to storm surge and coastal erosion are imminent threats to highways, roads, bridge supports, airports at or near sea level, seaports, and some transit system and rail lines" (page 118) and calls for vulnerability assessments and adaptation planning at various scales.
- The State Ocean Protection Council (OPC) stated in its [2018 Sea Level Rise Guidance](#) document that "California has an immediate opportunity to make smart, informed, and risk-based decisions that prepare our coastal and inland communities for change while ingraining sustainability, longevity, and resiliency into our planning, permitting, investment, development, transportation, and recreational decisions." The document provides guidance and guiding principles for SLR planning work. Although the Regional Plan references the potential for 2.5 ft of SLR by 2050 and 6.6 ft of SLR by 2100, OPC's guidance recommends, and Commission staff agrees, that the H++ scenario should be considered for projects with a lifespan beyond 2050 that have a low tolerance for risk, such as major infrastructure investments, and that could result in threats to public health and safety, natural resources and critical infrastructure, should extreme sea-level rise occur. By 2100, the H++ scenario is 10.2 ft of SLR.
- The [California Transportation Plan 2050](#) calls for sea level rise adaptation planning, notably stating that: "As our population grows to nearly 45 million by 2050, providing high-quality infrastructure also means adapting assets to accommodate changing demand, and leveling the playing field for active transportation, rail, transit, and shared modes. Our infrastructure must also be resilient to the impacts of earthquakes, extreme temperatures, fires, sea level rise, and pandemics" (page 79). It includes a recommendation: "The CTP 2050 calls for expanded

funding for implementing state, local, and regional climate mitigation and adaptation plans, such as the Caltrans District Vulnerability Assessments; increasing multi-jurisdictional collaboration on resiliency and adaptation efforts; creating a statewide transportation risk management plan; and increasing access to data, technical tools, and information sharing to make communities stronger and more resilient to future disruptions” (page 112).

- The [2018 California State Rail Plan](#) calls for similar implementation efforts, noting that “Coastal rail corridors are commonly the first, or second, line of development adjacent to the sea, particularly in central and southern California. If reactive, emergency-based hard-armoring measures are constructed to protect corridors in place, beach loss may result. Thoughtful, long-term adaptation planning for sea-level rise is necessary to identify alternatives, including relocation of corridors where opportunities to do so exist, that would protect transportation corridors as well as California’s popular beaches and other coastal resources” (page 224). The Plan highlights segments of rail in San Diego, including along the Del Mar bluffs, which are at risk from sea level rise.
- Finally, Caltrans highlighted the importance of planning for sea level rise in its [2017 Regional Transportation Plan Guidelines for Metropolitan Planning Organizations](#).

The Regional Plan should include increased funding to adapt and/or relocate existing transportation infrastructure known to be vulnerable to climate change and sea level rise (e.g., Pacific Coast Highway and the rail corridor along Del Mar bluffs). New infrastructure proposed to be funded should be analyzed not only for vulnerability to H++ projections of SLR over the expected life of the proposed project, but also tidal and fluvial hydraulics as applied to the local area and in the context of storm surge, wave run-up, erosion, and other variables. Projects which reduce vulnerability to climate change and sea level rise (e.g., active transportation projects and relocation of the rail corridor from coastal bluffs) should be prioritized and expedited.

### ***Environmental Justice and Social Equity***

The Coastal Act was also recently amended to add Environmental Justice as a policy to be analyzed in our regulatory work, and to add a designated Environmental Justice commissioner on the Coastal Commission. Accordingly, although we applaud the Regional Plan’s focus on equity and recognize the need to generate revenue for implementation, Commission staff urge SANDAG to carefully analyze the equity implications of the Regional Pricing Strategy, including ensuring that dynamic tolling on managed lanes, parking and curb pricing, and road user charges do not regressively impact low-income community members who may not be able to afford to live in transit-oriented neighborhoods.

Further, the Regional Plan should utilize access to coastal recreation as a metric with which to measure the efficacy of its Environmental Justice programs. This should be accomplished by comparing travel times to coastal resources (e.g., the nearest usable beach) in communities of concern to travel times in other nearby communities. Transit programs should be designed to reduce these travel times and close gaps between communities to achieve equitable coastal access across the San Diego region, consistent with Coastal Act Section 30252.

### ***Railroad Corridor at Del Mar Bluffs***

Previous Regional Transportation Plans and the North Coast Corridor Public Works Plan / Transportation and Resource Enhancement Program (NCC PWP/TREP) have referenced the need for

relocation of the rail corridor that passes along the Del Mar bluffs to an inland alignment. Erosion due to wave action currently threatens the toe of the Del Mar bluffs and the stability of the railroad tracks at the top of the bluffs. Given that this segment of the LOSSAN rail corridor is already experiencing periodic bluff failures, which will only be exacerbated as sea level rise continues, Coastal Commission staff support relocation of the rail corridor and completion of double tracking as quickly as possible. The Coastal Commission has authorized a series of improvements to existing shoreline protection devices in Del Mar to maintain continued rail operations, including the most recent Consistency Certification No. CC-0004-18 in February 2019 and CC-0001-20 in August 2020; however, these projects are intended to serve as interim measures only. Although these types of repair and maintenance projects may be necessary in the short-term, they should not delay the planning efforts associated with a long-term solution, including identifying a preferred tunnel alignment and allocating funding to initiate environmental review of the rail corridor relocation project. If we continue to rely on reactive, hard-armoring measures to protect the rail corridor in place, we will lose our coastal beaches in the face of anticipated sea level rise at Del Mar and elsewhere. Therefore, Coastal Commission staff request that the Del Mar tunnel project be prioritized further by being moved to the five-year capital project list. This would allow double tracking to occur sooner, improving coastal access by sustainable modes of transportation while protecting the Del Mar bluffs, a vital visual and habitat resource for the San Diego region.

#### ***Enhanced Rail Service and the California State Rail Plan***

The Coastal Commission has previously approved transportation projects and programs that balance roadway expansion with the provision of transportation alternatives including railway enhancements, bicycle corridors, and pedestrian accessways (e.g., the North Coast Corridor Public Works Plan/Transportation and Resource Enhancement Program). In actions throughout California, the Coastal Commission has found that projects supporting alternative modes of transportation, particularly enhanced rail service, are consistent with Coastal Act policies requiring maximum public access and a reduction in VMT (Coastal Act Sections 30210 and 30253). The Regional Plan proposes funding for high-frequency transit services that incorporate new transit modes and improve existing services. Commission staff supports the vision for vastly improved regional and inter-regional bus and rail corridors, which will offer alternatives to driving and alternatives to roadway expansion in environmentally sensitive areas.

The California State Transportation Agency's Transit and Intercity Rail Capital Program (TIRCP) (2015) emphasizes the objective of "Expand[ing] and improv[ing] transit service to increase ridership." In 2020, the TIRCP allocated over \$38 million to capital improvements to the LOSSAN corridor, including new maintenance facilities that will allow for longer trains and more frequent and reliable service on the corridor. The Draft 2018 California State Rail Plan website states: "Californians collectively take billions of trips to millions of destinations each year, and the state needs quality modal choices among cars, transit, air travel, and active transportation to efficiently move people and freight to their destinations." Coastal Commission staff support the expansion of San Diego's commuter rail network and the double tracking of the LOSSAN corridor funded by the Regional Plan, in addition to other infrastructure improvements that encourage faster and more frequent intercity and intracity rail service such as those identified in the TIRCP.

#### ***Central Mobility Hub***

In previous comment letters, Coastal Commission staff have expressed support for the development of an intermodal transit station along the existing rail corridor to provide visitors with direct connections

to Amtrak, COASTER, Trolley, bus services, and the southern terminus for the proposed high-speed train service. The acquisition of land for the Central Mobility Hub and the completion of the automated people mover airport connection in 2035 (Pages A-17 and A-18, Appendix A) will significantly improve alternative access to the airport, thereby reducing the anticipated traffic impacts associated with redevelopment of Terminal 1 on North Harbor Drive, a major coastal accessway. Please note that Coastal Commission staff request to be included in future planning efforts related to the Central Mobility Hub, as well as the associated transportation infrastructure projects (e.g., automated people mover).

***Pacific Beach Trolley Extension and Streetcar***

Finally, the 2019 Draft Federal Regional Transportation Plan identified a trolley extension from Pacific Beach to the El Cajon Transit Center and a streetcar from Mission Beach to La Jolla via Pacific Beach slated for completion by 2050 (Table A.2, Appendix A). Neither of these projects is identified in the 2021 Draft Regional Plan. The popular beach community of Pacific Beach is already heavily impacted by parking and traffic congestion, which will be exacerbated in the future by redevelopment with increased density and the elimination of parking requirements by the City of San Diego for certain developments located near transit. Coastal Commission staff request the re-inclusion of these projects in the Regional Plan, as the transportation improvements identified for Pacific Beach in the 2021 Regional Plan leave large portions of the community without robust alternatives to single-occupant vehicle travel and increasingly strained access to parking, inconsistent with Sections 30212 and 30212.5 of the Coastal Act.

In general, Coastal Commission staff support improvements to transit alternatives that provide access to coastal areas and recreation. Significant gaps in the regional bus network improvements laid out in the Regional Plan exist in the coastal communities of Encinitas, Solana Beach, La Jolla, Pacific Beach, Mission Beach, and Ocean Beach, whereas other coastal communities are slated to enjoy more robust transit improvements. As such, Coastal Commission staff encourage SANDAG to analyze and prioritize transit improvements that improve coastal access in these communities, and particularly improvements that provide these communities with meaningful alternatives to single-occupant vehicles to access the nearby beaches and recreational areas.

Thank you again for the commitment to a bold new transportation vision for the 2021 Draft Regional Plan and for your ongoing work on other elements of San Diego Forward. We look forward to future collaboration and improvements to the transportation system in the San Diego region. If you have questions or ideas for collaboration, please do not hesitate to contact me at the Coastal Commission's San Diego Coast District office.

Sincerely,  
Trevor Hill  
Transportation Program Analyst

# Memorandum

*Making Conservation  
a California Way of Life.*

**To:** Tessa Lero  
Caltrans - District 8

**Date:** August 6, 2021

**From:** MEHEDI CHOWDHURY  
Division of Transportation Planning  
Office of State Planning, Equity and Engagement

**Subject:** **SAN DIEGO FORWARD DRAFT 2021 REGIONAL TRANSPORTATION PLAN (RTP)  
AND SUSTAINABLE COMMUNITIES STRATEGY (SCS)**

Thank you for the opportunity to review and provide comments on the 2021 Regional Plan/ Sustainable Communities Strategy. OSPEE would like to offer the following comments for your consideration:

**“A Bold New Vision for the 2021 Regional Plan”:**

- With development concentrated at the coastal region, has the scientists' estimates of a 2.5 sea level rise been taken into account for development in this area? (pdf page 9)
- There was a brief mention of the California Transportation Plan 2050 (CTP 2050) in the bulleted list on Page 14. As the State of California's transportation roadmap, it might be pertinent to demonstrate with a few sentences as to how the 2021 Regional Plan meets or aligns with the CTP 2050's Recommendations on Page 6 of the Executive Summary of the CTP 2050 document. Here is language that could be potentially used:
  - Senate Bill 391 (SB 391, 2009) required the California Department of Transportation to prepare the California Transportation Plan (CTP), a statewide to reduce GHG emissions. This system laid out in the CTP 2050 showed reductions in GHG emissions to 1990 levels from current levels by 2020, and 80 percent below the 1990 levels by 2050 as described by AB 32 and Executive Order S-03-05. The CTP 2050 demonstrates how major metropolitan areas, rural areas, and state agencies can coordinate planning efforts to achieve critical statewide goals. SANDAG will work to align with the goals, policies, strategies, and recommendations laid out in the CTP 2050 where applicable.
- Pages 14 and 15 feel a bit out of place and seems like it would be better places after the Table of Contents that is present in the “Forward” section, rather than being right before Chapter 2. The chapter list of Page 15 is essentially the same as the Table of Contents so keeping the nice graphics with the same overview/summary would be good, while having the actual TOC have subsections within the chapters listed, with their corresponding pages as well (5 Big Moves, etc).

**Sustainable Communities Strategy:**

- It may be beneficial to mention how these goals will contribute to California's overall State goal of reducing GHGs, with a mention of AB 32's goal of lowering statewide GHG emissions 80%

below 1990 levels by 2050 as well as SB 32's mid-point goal of lowering statewide GHG emissions 40% below 1990 levels by 2030. Disregard if this was mentioned but overlooked by the reviewer.

**General Comments:**

- On Page 44: "The 2015 update of the regional plan was projected to cost \$130 billion in 2020 dollars. The 2021 Regional Plan is projected to cost \$163 billion. Why the higher cost? As we have detailed in Chapters 1 and 2, the 2021, the Regional Plan completely reimagines our transportation system—". While the 2015 may also be assumed to have taken bold steps to *reimagine the transportation system*, it might be ideal to refer to the appropriate technical Appendix as to why a newer, updated approach is costing \$33 billion more six years later.
- Overall a very good and thorough plan, would just mention of alignment with the CTP 2050.

## California Department of Transportation

DISTRICT 11  
4050 TAYLOR STREET, MS-240  
SAN DIEGO, CA 92110  
(619) 688-6681 | FAX (619) 688-4299 TTY 711  
[www.dot.ca.gov](http://www.dot.ca.gov)

August 6, 2021

Mr. Hasan Ikhata  
Executive Director  
San Diego Association of Governments  
401 B Street, Suite 800  
San Diego, CA 92191

Dear Mr. Ikhata:

The California Department of Transportation (Caltrans) appreciates the opportunity to review the San Diego Association of Governments (SANDAG) San Diego Forward: The 2021 Regional Plan including its Sustainable Communities Strategy (SCS) and air quality conformity analysis.

The 2021 Regional Plan presents a data-driven, bold vision that will redefine how people and goods move around the San Diego region. Caltrans, as the owner and operator of the State Highway System, will work in coordination with SANDAG to deliver a world class transportation network that serves all people and respects the environment. It is our seamless partnership that continues to make the region competitive for federal and state funding.

The 2021 Regional Plan will help our region and our state achieve shared goals to provide mobility choices that advance equity and reduce pollution, boost our economy, and make our transportation system accessible for all. SANDAG and Caltrans are currently developing Comprehensive Multimodal Corridor Plans that with input from the public, will further identify and evaluate projects and strategies within transportation corridors defined in the 2021 Regional Plan. Additional refinements to individual corridor project scopes, costs and schedules will be made as these projects are studied under CEQA and NEPA, including any legislative changes needed for the implementation of those projects.

To receive federal transportation funds, SANDAG is required by federal and state law to develop a comprehensive, 20+ year vision of a balanced, multimodal transportation system. A regional plan must be updated at least every four years and allows the region to confirm the transportation plan's validity and consistency with current and forecasted transportation and land use conditions and trends.

Mr. Hasan Ikhata, Executive Director

August 6, 2021

Page 2

Caltrans has reviewed the 2021 Regional Plan and found that it has fulfilled all the requirements of the Caltrans 2017 Regional Transportation Plan Guidelines for Metropolitan Planning Organizations pursuant to California Government Code Section 14522. Caltrans offers the following comments:

Climate Action and the Multimodal Network topics

Transportation is the largest source of greenhouse gas (GHG) emissions in the San Diego region; in 2016, on-road light-duty vehicles accounted for 41% of emissions. One strategy to reduce emissions is to reduce Vehicle Miles Traveled (VMT). The Regional Housing Needs Allocation Plan informed development of the SCS land use pattern, and the region's major employment centers and urban core mobility hubs are expected to take on the most housing and job growth in the region over the next 30 years. It is anticipated this development pattern will support VMT reduction from light-duty vehicles by balancing the ratio of jobs to housing land uses. Additionally, the 2021 Regional Plan proposes expansion of the regional transit network such that thirty-minute transit access from mobility hubs to Tier 1 employment centers increases from 13% to 28% for communities of color and increases from 16% to 33% for residents with low incomes by 2050. This improvement will provide important access to economic opportunities to these communities while incentivizing mode shift.

Caltrans supports SANDAG's embrace of new and improved mobility management strategies such as developing a smart intersection system, a comprehensive system to manage cross-border trips, and real-time traffic management solutions (including dynamic truck parking) to manage many modes of transportation, including freight movement.

We encourage SANDAG to continue efforts on a recently funded grant to develop a Sustainable Freight Implementation Strategy. This work will help the region execute a road map for a more efficient, economically competitive, and sustainable freight transportation system, establish a framework to transition to a clean freight system, reduce pollution exposure to environmental justice communities, and help implement state sustainable freight efforts such as the California Sustainable Freight Action Plan, the California Freight Mobility Plan, Governor Gavin Newsom's "Zero-Emission by 2035" Executive Order (N-79-20), and Assembly Bill 617 (C. Garcia, 2017) Community Emission Reduction Program.

Caltrans supports consideration and the development of new mechanisms for viable VMT mitigation options for highway capacity projects, such as exploring statewide and regional VMT mitigation bank concepts and evaluating feasibility and exploring potential expansion of an Advanced Mitigation Program to include GHG/VMT mitigation.

As the 2021 Regional Plan looks to develop performance measures, analyze, and address congestion, please consider presenting data about how travel, delay, and transit use will evolve with the implementation of the plan.

#### Equity and Livability topics

Caltrans is encouraged by the investments outlined in SANDAG's Supporting Policies and Programs. These investments will support programs that complement the capital and operational investments of the transportation system, encourage sustainable growth and development, and implement innovative demand strategies. Please consider inclusion of a program for Highways to Boulevards Conversion or freeway cap/lid/decks to create new park space, housing, or community amenities to help restore and revitalize communities. Proposed locations will be discussed and determined in the future.

Please consider including in the listing of transportation projects, programs, and phasing the San Diego- Coronado Bridge Suicide Prevention Barrier Project. The Coronado Bridge has the highest concentration of death by suicide for a spot location on the state highway system. Without mention in the regional plan, the project may not be able to compete for state or federal funding.

The 2021 Regional Plan illustrates that in addition to Major Corridors, there are several rural corridors primarily in the eastern two-thirds of the region that provide access and connectivity for rural towns and lands to the interstate system. These roadways are to be improved with a focus on safety through shoulder widening, curve straightening, and technology features, such as active transportation and demand management and smart intersections.

Caltrans recognizes the rural areas of our region play a vital role in California's economy. Rural communities are often also the gateway to the state's preserved landscapes that are central to supporting California's tourism industry. Yet, rural communities are already experiencing the impacts of a changing climate— from unprecedented storms to devastating wildfires. While transportation goals are inherently and fundamentally the same no matter the context— to provide safe access to destinations for people and goods - unique local and regional conditions require tailored solutions to advance these goals, and solutions may look different in varying local contexts.

Please consider including additional examples of sustainable transportation solutions that could be applied in rural settings, understanding that these efforts will require collaboration with the local and Tribal governments that serve the locations, such as:

Mr. Hasan Ikhata, Executive Director

August 6, 2021

Page 4

- Increasing transit service in a corridor through investments in bus service, vanpools, micro-transit or mobility on demand services, and park-and-ride facilities.
- Roadside land management activities related to wildfire.
- Addressing safety through the multidisciplinary Safe System Approach that employ tools for speed management, such as road diets, conversion of intersections to roundabouts, and signal coordination to slow speeds.
- Improving efforts on coordination for broadband access in transportation and growth, remote work/VMT reduction, economic development, and regional housing strategies. Broadband access remains a critical issue in rural communities and with many Tribal nations.
- Adding and improving connected facilities for walking and bicycling and for first/last-mile connections to local, interregional, and regional transit routes. Rural cores should support walking and biking on commercial corridors and main streets.
- Prioritizing connections to natural areas; Tribal communities may desire access to ceremonial sites outside of the rural core.
- Facilitating emergency evacuations through efficient traffic management strategies, such as the use of contra flow, use of two-way left turn lanes as through travel lanes, construction of full structural sections of shoulders and installation of transportation management systems (TMS) elements, such as closed circuit television (CCTV) cameras, changeable message signs (CMS), and traffic detection equipment.
- Deploying zero-emission vehicle charging or fueling infrastructure—including for battery electric, fuel cell (hydrogen) electric, and other zero-emission vehicle technologies.

Caltrans thanks SANDAG for its leadership and the vision laid out in 2021 Regional Plan. We look forward to working side-by-side in making the San Diego region a place for residents, visitors, and businesses to thrive.

Sincerely,

ANN M. FOX  
Deputy District Director  
Planning and Local Assistance

### **Comments of the Center for Sustainable Energy® regarding SANDAG's Draft 2021 Regional Plan**

The Center for Sustainable Energy® (CSE; [www.energycenter.org](http://www.energycenter.org)) is pleased to provide comments regarding SANDAG's Draft 2021 Regional Plan. CSE commends SANDAG's efforts in developing a comprehensive and holistic vision for the future of transportation in the San Diego region. CSE encourages SANDAG to adopt the Regional Plan and continue collaborating with regional entities to implement clean technology programs that encourage electrification, prioritize equity, and enhance climate action planning.

CSE is a 25-year-old national nonprofit with a single word mission: Decarbonize. We provide program administration, technical assistance, and policy advisement services to a diverse set of stakeholders across the clean energy and transportation sector. As a nonprofit without members or donors, CSE serves as a trusted resource helping government agencies implement successful technology programs that use funds in the best interest of consumers, ratepayers, and the general public.

CSE provides these comments based on our experience designing, implementing, and evaluating statewide electric vehicle (EV) and EV infrastructure incentive programs across multiple jurisdictions. In the San Diego region, CSE is pleased to work with SANDAG on the administration of numerous programs, including the San Diego County Incentive Project under the California Electric Vehicle Infrastructure Project (CALeVIP).

In response to the Draft 2021 Regional Plan, CSE offers the following recommendations:

- Leverage the Mobility Hubs concept to showcase clean energy and transportation technologies;
- Continue to support regional coordination through SANDAG's Energy Working Group and Regional Plan Social Equity Working Group by sharing best practices regarding climate action planning, operationalizing equity, and emergency planning; and
- Ensure that the Next OS platform includes data on EV infrastructure availability and transportation emissions impacts and compiles platform insights onto public-facing dashboards.

CSE's recommendations are discussed in detail below.

### **Leverage the Mobility Hubs concept to showcase clean energy and transportation technologies**

CSE supports SANDAG's proposed Mobility Hubs concept to provide integrated transportation solutions. CSE recommends that SANDAG utilize these Mobility Hubs to showcase a variety of clean energy and transportation technologies. Specifically, Mobility Hubs could raise awareness of zero-emission transportation alternatives, including EVs and zero-emission buses. Additionally, the mere presence of visible public charging infrastructure can influence consumers' willingness to pay for an EV by up to \$5,000.<sup>1</sup> CSE also recommends that additional clean energy technologies be integrated into the Mobility Hubs. For example, EV chargers could be coupled with solar panels and battery storage systems to provide greater utilization of clean electricity. To expand this concept even further, CSE encourages SANDAG to consider deploying microgrids in conjunction with Mobility Hubs. Microgrids can further integrate these technologies to provide additional emissions reductions, while also managing grid impacts and providing resiliency benefits during extreme weather events. Through islanding capabilities, microgrids would enable Mobility Hubs to continue to charge electric fleets during electric grid outages, further alleviating consumers' concerns about all-electric transportation options.

### **Continue to support regional coordination through SANDAG's Energy Working Group and Regional Plan Social Equity Working Group by sharing best practices regarding climate action planning, operationalizing equity, and emergency planning**

CSE is pleased to participate in SANDAG's Energy Working Group (EWG) and strongly supports the EWG's role in coordinating regional climate action planning, particularly through the use of analytical tools such as the Regional Climate Action Planning Framework (ReCAP).<sup>2</sup> CSE encourages SANDAG to continue this work by periodically sharing best practices on climate action planning. For example, CSE suggests that the release of the ReCAP Snapshots be accompanied by targeted policy recommendations for local jurisdictions. Additionally, the EWG is an effective venue for sharing best practices on local climate equity planning initiatives, such as the Climate Equity Index reports prepared by the Cities of San Diego<sup>3</sup> and Chula Vista,<sup>4</sup> and applying these "lessons learned" on a broader regional scale. CSE also recommends SANDAG engage its Regional Plan Social Equity Working Group (WG) to gather feedback and recommendations on how to operationalize equity throughout the agency, using the Regional Plan as a starting point. Lastly, CSE recommends that the EWG and the Social Equity WG seek to collaborate with emergency planning and land use officials from state, regional, and local agencies, who are often not involved in conventional climate action planning activities. This type of information-sharing and collaborative planning across agencies and departments will be critical to mitigate the impacts of extreme weather events including heat

<sup>4</sup> City of Chula Vista. Draft Chula Vista Climate Equity Framework.

<https://www.chulavistaca.gov/home/showpublisheddocument?id=22124>

waves, wildfires, and droughts, which are expected to continue to increase in frequency and severity.

**Ensure that the Next OS platform includes data on EV infrastructure availability and transportation emissions impacts and compiles platform insights onto public-facing dashboards**

CSE supports the development of SANDAG's proposed Next OS platform to incorporate transportation data and streamline individuals' travel patterns. CSE offers a number of recommendations to integrate EVs into this platform and facilitate better understanding of travel behavior and associated emissions impacts.

First, CSE recommends that SANDAG include data on EV infrastructure locations and availability in the Next OS platform. Lack of access to EV charging is often cited as one of the largest barriers preventing consumers from purchasing EVs. Even EV owners often experience difficulty finding a public EV charger given the number of EV service providers (EVSPs) with proprietary software applications. Additionally, CSE encourages SANDAG to consider integrating information regarding EV charger availability to prevent queues from developing at these sites. While some EVSPs have added waitlist functionalities into their software,<sup>5</sup> there is no uniform approach to addressing this challenge. By integrating these factors into the Next OS platform, SANDAG can support current and prospective EV owners and further promote electrified transportation.

Second, CSE recommends incorporating greenhouse gas (GHG) emissions data into the Next OS platform in order to provide individuals with information regarding the estimated emissions intensity of various transportation modes. For example, an individual could use the Next OS platform to choose between taking transit or requesting ride-hailing services, considering the emissions associated with each mode and making their decision based off of this information. Similarly, the platform could compare the emissions intensity of various options within a specified mode of travel. For example, an individual choosing to use ride-hailing services could assess the emissions impacts of single-occupancy vehicle trips versus pooled trips or the difference between rides in an EV versus in an internal combustion engine vehicle. This functionality could increase public awareness of emissions impacts and encourage greater utilization of clean transportation options.

Third, CSE recommends that the key analytical insights obtained through the Next OS platform be compiled and highlighted on public dashboards, either on the platform itself or on SANDAG's website. By its nature, the Next OS platform will collect significant levels of data on individual travel patterns and preferences. Analyzing this data will yield key insights that can further inform regional planning and policymaking. Additionally, highlighting these insights through dashboards and visualizations, and thereby making this data accessible and understandable to the general public, will also enable individuals to better understand their transportation options and impacts. These dashboards should be made available in multiple languages and should be updated at regular intervals.

## Conclusion

CSE appreciates the opportunity to provide these comments in support of SANDAG's Draft 2021 Regional Plan. We look forward to continued collaboration with SANDAG and other stakeholders in advancing clean transportation and emission reduction goals within the San Diego region.

Sincerely,

Raghav Murali

August 5, 2021

Mr. Hasan Ikharata  
SANDAG, Executive Director  
401 B St, Suite 800  
San Diego, CA 92101

**Re: Support incorporating *Reconnect Logan, 5 Freeway Lid Project* in the San Diego Association of Governments' (SANDAG) 2021 Regional Plan**

Dear Mr. Ikharata,

My name is Josephine S. Talamantez and my family have been Logan Heights residents since 1906 and the CPMCC have been in the area for 6 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego's Barrio Logan and Logan Heights communities. **Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan (Draft Plan)**

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know *ReConnect Logan Freeway Lid* will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out *ReConnect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)

# CHICANO PARK MUSEUM

- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, *ReConnect Logan Freeway Lid* is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to **the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.**

If you have any questions, you may contact me at [jstalamantez@gmail.com](mailto:jstalamantez@gmail.com).

Sincerely,

Josephine S. Talamantez  
Board Chair  
(916)847-4569  
PO Box 131128  
San Diego, Ca. 92170

July 21, 2021

Supervisor Nora Vargas,  
Chair, Transportation Committee  
SANDAG  
401 B Street, Suite 800  
San Diego, CA 92101

Dear Transportation Committee Chair Nora E. Vargas,

Chollas Creek Coalition requests SANDAG include Chollas Creek Regional Park active transportation and recreational facilities in the 2021 update of the San Diego Forward Regional Transportation Plan (RTP).

Environmental Justice communities located along the Chollas Creek Watershed have been historically under-invested in and residents are predominantly lower-income people of color with higher-rates of health issues resulting from over-pollution and inequitable access to economic opportunity. These communities bisected by freeways do not have safe mobility connections for people to get around without a car.

The future Chollas Creek Regional Park **included in the 2021 draft of the City of San Diego's Parks Master Plan** has approximately 8 miles of parks, trails, recreational amenities, trees, bikeways and stormwater infrastructure improvements along the north and south forks of the Chollas Creek in need of planning and funding. This trail system once completed would connect City Heights, Southeast San Diego and the communities in between all the way to Barrio Logan and the employment centers along the San Diego Bay.

SANDAG has a once in generation opportunity to make a meaningful investment in the many communities along the Chollas Creek by including the Chollas Creek Regional Park and associated bikeway projects in the RTP. These critical active transportation connections to improve community health, resiliency to climate change and link housing to jobs are many decades over-due. We urge SANDAG to invest in the project to advance equity, climate justice and a historic win for communities who have been ignored for far too long.

Regards,

Chollas Creek Coalition

August 4<sup>th</sup> 2021

Dear SANDAG Board & Staff,

We appreciate your efforts to facilitate opportunities for community engagement through the 2021 Regional Plan by hosting open house forums, public hearings, and online public comment. The City Heights Built Environment Team is a community group who wants to see a dignified, equitable, efficient and affordable transportation system in our region.

These are the top priorities our group has identified and would like to see implemented in the 2021 Regional Plan:

- Greater transit frequencies (7 min on peak, and 10 mins all day) in Transit Priority Areas; Collaborate with the Built Environment Team on a Pilot Program to identify and test high ridership routes in City Heights
- Late night and weekend service improvements with 24-hour service on major routes
- Supporting the Purple Line alignment through central City Heights
- Bikeways on major corridors with implementation of Early Action Projects in Mid-City by 2023
- Implementing traffic-calming measures including but not limited to: protected bike lanes, roundabouts, raised crossings to improve to ensure a safer biking experience
- Planting more trees throughout City Heights to foster a healthier urban environment
- Ensuring Youth Opportunity Passes for those aged 24 and under by 2023
- Oppose freeway expansions in City Heights that increase Vehicle Miles Traveled while supporting general purpose lane conversions that prioritize transit
- Improve multimodal beach access for urban-core communities
- Plan and implement Bus Rapid Transit Route 550 on 54<sup>th</sup> St. to be phased for 2025
- Improve and exceed State of California standards for GHG reduction goals
- Maintain transparency with community members by sharing relevant data and progress updates surrounding project phasing, implementation, and funding

We believe these priorities will help build a dignified, equitable, and affordable transportation system in our region.

Sincerely,

Maria Cortez

**RE: City of Carlsbad Comments on Draft 2021 Regional Plan**

To whom it may concern,

This letter serves to inform SANDAG that the City does not wish to remove project CB32 from the Regional Arterials Project list.

Please disregard the comment regarding project CB32 from the attached letter sent to SANDAG on Aug. 6, 2021.

Thank you for bringing this to our attention, and please contact me if you have any other questions regarding the 2021 Regional Plan comment letter.

Best Regards,

A handwritten signature in blue ink, appearing to read "Tom Frank".

Tom Frank, PE  
Transportation Director/City Engineer

**RE: City of Carlsbad Comments on Draft 2021 Regional Plan**

To Whom it May Concern,

The City of Carlsbad appreciates the opportunity to provide comments on the draft 2021 Regional Plan ("Plan"). This is an important plan for this region and will guide the next phase of growth for the member agencies of the San Diego Association of Governments ("SANDAG"). An effectively designed and implemented regional transportation plan would help ensure improved transportation options for area residents, businesses and other community members; meaningful reductions in greenhouse gas ("GHG") emissions; and improved quality of life as we grow our communities.

The City of Carlsbad ("city") is submitting comments based on the policies, projects, programs and other improvements included in the Plan. Our agency's comment letter is divided into two sections. The first section seeks clarity and other considerations that pertain to our agency's review of the Plan. The second section identifies the city's preliminary comments and recommendations.

Implementing the regional transportation network outlined in the Plan requires municipalities to support the regional vision and deliver on local infrastructure and services like the priority bus routes, local bus services, and pedestrian and cycling connections to major transit infrastructure. These components, which are delivered by municipalities, are essential to creating a coherent and comprehensive local transportation network that feeds into regional services. For that reason, an effective public review of the Plan should involve a transparent and thorough process for identifying and evaluating potential hazards, physical changes to the environment and indirect (off-site and cumulative) impacts that might result from implementation activities that may reasonably occur with the Plan.

The city's residents, businesses and other community members will greatly benefit from the involvement and technical assistance from the prospective Draft Environmental Impact Report ("EIR"). Therefore, what follows in this correspondence represents our agency's preliminary comments and recommendations. The city reserves the right to add, amend, change or replace comments and recommendations based on additional review and understanding of the Plan and the environmental analysis provided under the California Environmental Quality Act ("CEQA").

The city thanks SANDAG staff for meeting with city staff on Aug. 2, 2021, to discuss some of these comments in advance of this letter. Following that meeting, SANDAG provided language that they may recommend adding to the Regional Plan for additional clarification on land use authority. The language is, "Land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the Plan through understanding of the unique needs of their communities and geographies." This language will be helpful to clarify that land use authority rests with

Transportation & Community Development Departments

City of Carlsbad Comments on Draft 2021 Regional Plan  
Aug. 6, 2021  
Page 2

the local jurisdiction. The city still offers the following comments with the intent to support development of a defensible and realistic regional plan.

#### **SECTION 1: CLARITY AND OTHER CONSIDERATIONS**

City staff have attended the series of workshops that SANDAG hosted during the public review period, and respectfully starts this section with several questions related to the process of the Plan and the Draft EIR. By way of introduction, a jurisdiction's General Plan, such as the city's General Plan, identifies the expected population of the city and any lands outside of the city limits but within their Sphere of Influence where future growth is anticipated to occur. The city's General Plan identifies the subject area adjacent to the McClellan-Palomar Airport for development under the designation for limited and light industrial use.

For future land use planning, land use assumptions must reasonably proxy and be generally consistent with local planning standards and programs, to be considered growth accommodating rather than growth inducing. SANDAG has the authority under Government Code Section 65584 to determine existing and projected housing needs, as well as the share of housing needs to be allocated to cities and counties, but it is unclear if SANDAG has jurisdiction to allocate new housing growth to areas in a manner not consistent with Government Code Section 65584. Attachment 1 includes additional information on the applicable Government Code and standards. Therefore, and as indicated above, the build-out of properties within the Business Park and flight activity zone must be done in accordance with the city's General Plan Land Use Diagram, as amended, in accordance with city approval.

The initial questions on the planning process associated with developing the Plan are provided below:

1. The SANDAG website states, "The SANDAG Sustainable Communities Strategy and Final EIR from its 2015 Regional Plan will remain valid and in compliance for purposes of state funding eligibility and other state and federal consistency purposes until the SANDAG Board of Directors adopts a new Regional Plan and EIR, provided those actions are completed by the end of December 2021." SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. Additionally, please clarify when the Draft EIR will be available; it is difficult to completely assess the full impacts of this plan when the public review of the documents is piecemealed.
  - a. SANDAG should clarify how public comments on the Plan are going to be addressed in the Draft EIR prior to its release.
  - b. In the Draft EIR, SANDAG needs to clearly articulate the impacts to land use and if the Plan will cause a significant environmental impact due to a conflict with any land use plan, policy or regulation adopted for the purpose of avoiding or mitigating an environmental effect. Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern appears to be inconsistent with the city's General Plan and rezone program to accommodate the Regional Housing Needs Assessment, as well as the general plans of other jurisdictions such as the cities of Coronado, Del Mar and the County of San Diego. The Draft EIR should clarify how implementation of this Plan can occur if those changes are not made.

2. The city has three mobility hubs, associated with the Employment Centers Published supporting the SANDAG Regional Plan.<sup>1</sup> McClellan-Palomar Airport is the fifth largest employment center in the region, with Carlsbad State Beach and Carlsbad Village as “Tier 3 and Tier 4” employment centers. The city thanks SANDAG for providing data for analysis to determine impacts and provide for accurate comments on the Plan. Attachment 2 shows a summary of the Mobility Hubs and housing units assumed in the Series 14 Growth Forecast for the year 2050. In summary:
- a. The assumptions in the updated Series 14 Growth Forecast contain inconsistencies with the city’s General Plan. The Carlsbad Palomar Major Employment Mobility Hub does include increases in density beyond what the citywide numbers appear to show when they are looked at in more detail.
    - i. There are three locations in which density is shown to be inconsistent with good planning principles, the city’s General Plan and the Airport Land Use Compatibility Plan. The three most problematic areas (shown in Attachment 3) are:
      1. 736 units on parcels immediately adjacent to the McClellan-Palomar Airport runway. The location of the airport within this mobility hub was shared with SANDAG staff multiple times at workshops. This is inconsistent with the regulations provided by the San Diego County Regional Airport Authority and conflicts with standard planning principles for siting housing away from hazards.
      2. 2,755 units on existing developed resort properties and open space dedicated lands adjacent to Legoland.
      3. 65 units in a preserved open space area.
    - ii. SANDAG should provide additional detail why units were assumed in these areas, what planning principles those decisions were based on, and how SANDAG expects this to be implemented.
    - iii. Concentration of units in the mobility hubs alone appears to conflict with the direction received from the California Department of Housing and Community Development (“HCD”) to implement new Affirmatively Furthering Fair Housing (“AFFH”), which seeks to combat housing discrimination, eliminate racial bias, undo historic patterns of segregation, and lift barriers that restrict access in order to foster inclusive communities and achieve racial equity, fair housing choice and opportunity for all Californians. The allocations of land use provided by SANDAG seem to focus all the higher density housing into one area of the city. (This is one of the largest points of analysis that each jurisdiction in the region needs to respond to in order to receive a certified Housing Element.)
  - b. Additionally, looking at the detailed data provided by SANDAG, it is now clear why the citywide numbers only show moderate increases in population. Our analysis has shown that there is an assumed reduction of population by 2,310 persons in the areas within the city but outside of the mobility hubs. This is likely due to assumed reductions in persons per household over time, but SANDAG should clarify the source and reasonableness of this assumption. If housing is not provided consistent with these areas, is it still reasonable to assume persons per household will be reduced in 2050?

<sup>1</sup> SANDAG Website: Employment Centers [SANDAG :: PROJECTS :: San Diego's Regional Planning Agency](#)

## City of Carlsbad Comments on Draft 2021 Regional Plan

Aug. 6, 2021

Page 4

- c. Furthermore, this reduction in population is not limited to the City of Carlsbad. There is an approximately 85,000 reduction in population assumed outside of mobility hubs regionwide. SANDAG needs to address if that is a reasonable assumption and if this will result in other impacts to public and private projects that will rely on this growth forecast, and the associated Activity Based Model (2+) to project future impacts to transportation, GHG, air quality and noise.
    - d. The forecast has decreased in future population based on current trends, but it is not clear if there is enough housing provided with reductions and increases in some jurisdictions. Will the reduced amount of housing that will be provided result in an increased exacerbation of the affordability crisis?
    - e. There is a lack of clarity about how the Plan would be implemented at the municipal level. SANDAG should develop an approach for engaging with municipalities to ensure local support for delivering the regional transportation network. Staff from local jurisdiction have the knowledge and ability to share where there are land use assumptions that conflict with planning and zoning laws. Our analysis focused on the City of Carlsbad, but if these types of assumptions are made regionwide, it presents flaws in the overall analysis. These flaws put the assumed reductions in vehicle miles traveled ("VMT") and ability to implement the Regional Plan into question.
  3. The area designated is controlled for use and activity density and intensity through its spatial association with the McClellan-Palomar Airport. The McClellan-Palomar Airport is defined by the Federal Aviation Administration ("FAA") as a commercial service airport that, in addition to private aircraft, has regularly scheduled commercial flights to Los Angeles International Airport ("LAX"). The McClellan-Palomar Airport Land Use Compatibility Plan ("ALUCP") is prepared according to FAA requirements and adopted by the San Diego County Regional Airport Authority acting as the Airport Land Use Commission for the County of San Diego.
    - a. The ALUCP provides measures to minimize the public's exposure to excessive noise and safety hazards within areas around the airport and identifies areas likely to be impacted by noise and flight activity created by aircraft operations at the airport. These impacted areas include the Airport Influence Area ("AIA"), the Clear Zone and the Flight Activity Zone.
    - b. Within the AIA, the ALUCP establishes six safety zones for the purpose of evaluating safety compatibility of new/future land use actions. The safety zone boundaries depict relative risk of aircraft accidents occurring near the airport and are derived from general aviation aircraft accident location data and data regarding the airport's runway configuration and airport operational procedures. The ALUCP limits development intensities in these zones by imposing floor area and lot coverage maximums, by incorporating risk reduction measures in the design and construction of buildings, and/or by restricting certain uses altogether. For example, all residential and virtually all non-residential uses are considered incompatible land uses in some zones, while considered to be either compatible or conditionally compatible with the airport in other zones. Attachment 4 shows the McClellan-Palomar Airport, noise contours and SANDAG's proposed housing units.
    - c. If the proposed SANDAG land use assumptions are endorsed, an amendment to the city's General Plan would be required to change the land use designation to Mixed-Use Commercial or residential land uses within the existing Business Park in order to effectuate the underlying assumptions of SANDAG staff. This is not a realistic

City of Carlsbad Comments on Draft 2021 Regional Plan

Aug. 6, 2021

Page 5

- assumption. Further, the protected airspace referenced in the AIA and the ALUCP must also be amended based on SANDAG's regional planning assumptions. (The FAA establishes airspace protection zones in the airspace above and surrounding airports in order to protect aircraft from obstructions such as buildings, towers, etc. in navigable airspace.)
- d. When a General Plan is adopted or amended, the allowable growth pattern of an area is identified and the expansion or updating of the various land uses as specified in the General Plan can occur throughout the planning horizon. Without such growth considerations, the expansion or intensification of existing land uses could be considered "growth inducing." Unplanned and uncontrolled growth may have significant adverse impacts on the environment. CEQA requires a discussion of how a "project" could increase population, employment or housing growth in surrounding areas and the impacts resulting from this growth. The CEQA Guidelines indicate that a "project" would normally have a significant effect on the environment if it would induce substantial growth or a substantial concentration of population.
4. At this point, it is not clear if SANDAG's assumptions adequately contemplate the development patterns included in the Sustainable Communities Strategy ("SCS")/Regional Transportation Plan ("RTP"), and Regional Air Quality Strategy ("RAQS"), local climate action planning business-as-usual estimates, sub-regional traffic modeling, or the airspace assumptions of AIA and the ALUCP.
  5. The city seeks clarity on the Plan's underlying assumptions made to justify the proposed extensive high-speed rail network considering the significant changes in travel behavior which have occurred throughout the region as a result of the COVID-19 pandemic and due to the advancements in disruptive technologies such as telecommuting, autonomous vehicles, microtransit, etc.
    - a. Recent North County Transit District ("NCTD") Coaster ridership data show riders are not returning to riding the Coaster in comparison to other modes of travel as shown in Attachment 5.
    - b. This question is consistent with comments made by SANDAG's panel expert Bob Poole regarding the impact of the COVID-19 pandemic on transit ridership and mega-transit projects. (See comments by Bob Poole during the March 12, 2021 presentation to SANDAG starting at timestamp 1:30 p.m.: [https://youtu.be/q-e6bNY5J\\_8?t=5410](https://youtu.be/q-e6bNY5J_8?t=5410))
  6. The city seeks clarity on why an alternatives analysis was not conducted with consideration of other transit alternatives such as automated /shared vehicle technologies and personalized zero emissions transit programs that are capable of utilizing the existing regional freeway infrastructure in response to these recent developments explained in the above comment.
  7. The city seeks clarity on why the Plan does not incorporate policies to promote roundabouts over signalized intersections and include a budget line item under the Complete Corridors to fund the construction of roundabouts at new locations and to replace signalized intersections when found feasible. This clarification would support the Federal Highway Administration ("FHWA")'s project for [Accelerating Roundabout Implementation in the United States](#) and the [County of San Diego Air Pollution Control Board's support for implementing roundabouts to address GHG and reduce fatalities](#).
  8. The city seeks clarity on the project phasing proposed within the Plan. Specifically, the city is seeking to understand the timing of implementation of unfunded TransNet projects related to

City of Carlsbad Comments on Draft 2021 Regional Plan  
 Aug. 6, 2021  
 Page 6

the new projects presented within the Regional Plan. To support this, the city is requesting that SANDAG input the information requested in Table 1 (Attachment 6).

9. The city seeks specific data on the proposed 200 miles of rail service contemplated in the Plan. To support this, the city is requesting that SANDAG input the information requested in Table 3 (Attachment 7). Specific questions:
  - a. Please provide more information about the scope of the high-speed rail alignments, potential vehicle technologies and their cost estimates.
  - b. Will the Coaster keep the same rail alignment?
  - c. What funding is programmed or planned for the Carlsbad Village railroad trench and the other projects along the current NCTD/Coaster Service right-of-way?
  - d. Will some of the tracks be at grade with fencing and trains traveling at 110 miles per hour speeds?

## SECTION 2: COMMENTS AND RECOMMENDATIONS

In addition to the comments on process and the Draft EIR provided above, city staff remain concerned that there is not enough detail on the feasibility of implementation of this significant shift in transportation strategy. On specific content in the plans, we outline our recommendations and comments below:

### 1. *Paying for the Plan:*

The draft 2021 Regional Plan sets out an ambitious plan to build and operate a region-wide system of transportation projects, programs and other improvements. This is a substantial role for SANDAG to play in supporting both the construction and operation of these projects, programs and other improvements. SANDAG should set annual revenue targets to directly fund everything and should approve any recommended sustainable revenue tools to help meet these targets. Many of the funding strategies will require legislative changes, or voter-approved taxation. SANDAG should clarify what will occur if the funding is not available, if opposition to projects stops them from construction, and if General Plans in the region are not modified to implement the Plan.

### 2. *Appendix D: Sustainable Community Strategy Documentation:*

Appendix D includes the Sustainable Communities Strategy, which outlines assumptions included in the Activity Based Model 2+ ("ABM 2+"), updated for this. This model will be necessary for use by publicly and privately initiated land use projects preparing documents for consistency with VMT/CEQA Guidelines and Traffic Impact Analysis ("TIA") Evaluations. City staff respectfully request direction from SANDAG on how to conduct modeling with the service bureau and how to factor in these assumptions applied to ABM 2+. Specifically, the addition of pricing, parking costs for coastal communities, 10% teleworking and micromobility. SANDAG should provide direction on how this could be worked into General Plans that are updated every 5-20 years.

### 3. *Appendix A: Transportation Projects, Programs, and Phasing:*

Trips to and from school sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools.

City of Carlsbad Comments on Draft 2021 Regional Plan  
 Aug. 6, 2021  
 Page 7

Table A.11: Given the proven success of the Carlsbad Connector microtransit pilot program, the city agrees with the Plan's recommendations to provide similar on-demand microtransit systems throughout North County at all mobility hub sites and major transit centers.

Table A.13: The segment of El Camino Real between Poinsettia Lane and Camino Vida Roble is proposed to be widened from two to three lanes to prime arterial standards. With the adoption of the city's General Plan, the city has determined that the widening of this portion of El Camino Real is not feasible due to constrained right-of-way and would result in negative impacts to other travel modes. City staff recommend removal of this proposed project recommendation CB32 (that is, a 'do nothing' scenario, or appraise and evaluate different mobility projects and/or alternative designs).

The preferred Interstate-5 freeway alternative identified in the North Coast Corridor ("NCC") Final EIR/EIS is the refined 8+4 Buffer alternative, with four freeway lanes and two managed lanes in each direction and completion by 2035. Appendix A, Table A.5 describes NCC project IDs CC004, 007 - 009 as "8F to 6F+4ML" with completion by 2050. While this might lead to further study, it is not clear why there is a different freeway configuration (i.e., reduction in freeway lanes) proposed. How does a reduction in lanes continue to meet NCC potential project benefits of maintaining or improving traffic operations and improving the safe and efficient regional movement of people and goods?

#### 4. *Active Transportation:*

The city appreciates the Regional Plan's overall approach of providing a connected network of high-quality bicycle facilities throughout the region. Regional bikeways are recommended throughout the city including along Palomar Airport Road which will provide a key east-west connection and El Camino Real which will provide a new north-south bikeway connection through the city. Both roadways are proposed to include "on-street bikeways". Due to the high traffic volumes and vehicle speeds experienced along most of both corridors, the city recommends considering "off-street bikeways" or Class I facilities where feasible in order to stimulate the shift from personal motor vehicle use to people choosing to bike.

It is extremely important that municipal transportation plans align with regional transportation plans to achieve regional goals for land use and transportation and to promote the region working together to build a cohesive regional transportation network. Considering there are currently no mechanisms in place to ensure municipalities coordinate local transportation plans with regional planning documents, the Plan should provide an approach on how SANDAG plans to engage with municipalities, especially in areas of potential disagreement or conflict (as aforementioned in this subsection and others). It is also recommended that the Plan provide additional direction regarding the application of protected bikeways in a variety of applicable contexts. While vertical measures such as soft hit posts may be appropriate in lower volume and lower speed roadways, arterial roadways with high traffic volumes and high speeds warrant much more substantial physical protection from vehicles. In addition, special consideration should be given at intersections and driveways which may be impacted due to the additional width and visibility impacts created by protected bikeways.

City staff look forward to working with SANDAG on improving mobility and land use access in the region and building sustainable, equitable and healthy modes of transportation, and we appreciate the opportunity to comment on the Plan that will help the region realize these goals.

## Attachment 1: Government Code 65020 (S.B. 375) Summary

Government Code section (“GOV §”) 65080, also referred to as California Senate Bill 375 (Steinberg, 2008) (“SB 375”), is one area of law that provides SANDAG with guidance to which a regional transportation plan must be developed.

Among other things, the regional transportation plan that is developed “shall be an internally consistent document” (GOV § 65080 (b)) and shall include a “sustainable communities strategy prepared by each metropolitan planning organizations as follows” (GOV § 65080 (b)(2)(B)):

*Each metropolitan planning organization shall prepare a sustainable communities strategy, subject to the requirements of Part 450 of Title 23 of, and Part 93 of Title 40 of, the Code of Federal Regulations, including the requirement to utilize the most recent planning assumptions considering local general plans and other factors. The sustainable communities strategy shall (i) identify the general location of uses, residential densities, and building intensities within the region, (ii) identify areas within the region sufficient to house all the population of the region, including all economic segments of the population, over the course of the planning period of the regional transportation plan taking into account net migration into the region, population growth, household formation and employment growth, (iii) identify areas within the region sufficient to house an eight-year projection of the regional housing need for the region pursuant to [Section 65584](#), (iv) identify a transportation network to service the transportation needs of the region, (v) gather and consider the best practically available scientific information regarding resource areas and farmland in the region as defined in [subdivisions \(a\) and \(b\) of Section 65080.01](#), (vi) consider the state housing goals specified in [Sections 65580 and 65581](#), (vii) set forth a forecasted development pattern for the region, which, when integrated with the transportation network, and other transportation measures and policies, will reduce the greenhouse gas emissions from automobiles and light trucks to achieve, if there is a feasible way to do so, the greenhouse gas emission reduction targets approved by the state board, and (viii) allow the regional transportation plan to comply with Section 176 of the federal Clean Air Act ( [42 U.S.C. Sec. 7506](#) ).*

The 2021 draft Regional Transportation Plan includes a Sustainable Communities Strategy (“SCS”), as required by SB 375 for the San Diego region (herein after called “draft Regional Plan”). The draft Regional Plan indicates that “SB 375 requires the SCS to include a pattern for forecasted growth and development that accomplishes the following: 1) When combined with the transportation network, the SCS will achieve the regional GHG emission–reduction targets; 2). The SCS accommodates the Regional Housing Needs Assessment (“RHNA”) Determination; and 3) The SCS utilizes the most recent planning assumptions. (Reference p. 19 of the 2021 Regional Plan.)

Predicting the effect of transportation plans or projects on land uses and land use planning is critical to developing context sensitive solutions for transportation projects. Therefore, utilization of the most recent planning assumptions is not only necessary but is required as specifically stated therein GOV § 65080. If inconsistencies are found in the land use assumptions or adverse impacts are anticipated, SANDAG should be actively engaged in the development of measures to address these issues.

The SANDAG Board of Directors approved the final RHNA plan with the final housing unit allocation on July 10, 2020, which was based on the most recent land use planning assumptions and an adopted methodology to allocate housing in accordance with GOV §§ 65584.04(d and m). The City of Carlsbad received a total RHNA allocation of 3,873 units as a result of RHNA plan adoption. The adopted April 6, 2021 city’s Housing Element accommodates its housing needs through current zoning and other programs

## Attachment 1: Government Code 65020 (S.B. 375) Summary

as needed to meet the city's RHNA obligation at all income levels. The land use inputs derived from this local planning document constitutes the most recent land use assumptions. On July 13, 2021 the Department of Housing and Community Development found "the adopted housing element is in substantial compliance with State Housing Element Law (Article 10.6 of the Gov. Code).

The most recent planning assumptions are critical for the development of the draft Regional Plan as the document must comply with other specific state and federal mandates including a SCS per California Senate Bill 375, which achieves GHG emissions reduction targets set by the California Air Resources Board and compliance with federal civil rights (Title VI) requirements, environmental justice considerations, air quality conformity, and public participation. To monitor compliance and attainment of state reduction goals in GHG, GOV § 65080 (b)(2)) requires that:

*(H) Prior to adopting a sustainable communities strategy, the metropolitan planning organization shall quantify the reduction in greenhouse gas emissions projected to be achieved by the sustainable communities strategy and set forth the difference, if any, between the amount of that reduction and the target for the region established by the state board.*

*(J)(i) Prior to starting the public participation process adopted pursuant to subparagraph (F), the metropolitan planning organization shall submit a description to the state board of the technical methodology it intends to use to estimate the greenhouse gas emissions from its sustainable communities strategy and, if appropriate, its alternative planning strategy.*

There is inevitably some uncertainty regarding the use of projected future conditions. However, what is certain is that the project will not operate under the conditions that exist today. There will be new residential and employment growth in the intervening years between now and the proposed build-out of the draft Regional Plan. Nonetheless, projections utilized should represent the best available information assembled by the local agencies with jurisdiction and expertise. Judgments about land use assumptions utilized in the draft Regional Plan should be based on and supported by facts, adopted plans, and "most recent planning assumptions," rather than speculation and personal opinions. The land use assumptions for "uses, residential densities, and building intensities within the region" (as required by GOV § 65080 (b)(2)(B)(i)) should also be the same, as that provided to the state board (as required per GOV §§ 65080 (b)(2)(H and J) in estimating and analyzing GHG from the SCS and the effect on growth and whether the effects of that growth would be significant in the context of the region's plans, natural setting, and growth patterns. Ultimately, the SCS must demonstrate whether SANDAG can meet the per capita passenger vehicle-related GHG emissions targets for 2035 set by the California Air Resources Board ("CARB").

SB 375 directs CARB to accept or reject the determination of SANDAG that its SCS submitted to CARB would, if implemented, achieve the region's GHG emissions reduction targets. CARB's technical evaluation of SANDAG's draft Regional Plan would be based on all the evidence provided, including the models, the data inputs and assumptions, the SCS strategies, and the performance indicators.

The transportation and planning assumptions are also extremely important as it is relied on for other master planning exercises. The Regional Air Quality Strategy ("RAQS") relies on information from CARB and SANDAG for information regarding projected growth in the cities and San Diego County. This in turn is utilized to address other state requirements, including the San Diego portion of the California State Implementation Plan ("SIP") and promulgating their own rules and regulations regarding air quality in the region or to address federal requirements.

## Attachment 1: Government Code 65020 (S.B. 375) Summary

The analysis of land use impacts for transportation projects is guided by FHWA Technical Advisory T 6640.8 and the CEQA Guidelines.

Under the FHWA Technical Advisory T 6640.8 (G)(1), Guidance for Preparing and Processing Environmental, states:

*This discussion [of land use] should identify the current development trends and the State and/or local government plans and policies on land use and growth in the area which will be impacted by the proposed project. These plans and policies are normally reflected in the area's comprehensive development plan, and include land use, transportation, public facilities, housing, community services, and other areas.*

*The land use discussion should assess the consistency of the alternatives with the comprehensive development plans adopted for the area and (if applicable) other plans used in the development of the transportation plan required by Section [23 U.S. Code §] 134. The secondary social, economic, and environmental impacts of any substantial, foreseeable, induced development should be presented for each alternative, including adverse effects on existing communities. Where possible, the distinction between planned and unplanned growth should be identified.*

There is also a requirement to analyze the land use planning inconsistencies per CEQA Guidelines § 15126.2(a), which specifies that an EIR for a proposed project include:

*The Significant Environmental Effects of the Proposed Project. An EIR shall identify and focus on the significant effects of the proposed project on the environment. In assessing the impact of a proposed project on the environment, the lead agency should normally limit its examination to changes in the existing physical conditions in the affected area as they exist at the time the notice of preparation is published, or where no notice of preparation is published, at the time environmental analysis is commenced. Direct and indirect significant effects of the project on the environment shall be clearly identified and described, giving due consideration to both the short-term and long-term effects. The discussion should include relevant specifics of the area, the resources involved, physical changes, alterations to ecological systems, and changes induced in population distribution, population concentration, the human use of the land (including commercial and residential development), health and safety problems caused by the physical changes, and other aspects of the resource base such as water, historical resources, scenic quality, and public services. The EIR shall also analyze any significant environmental effects the project might cause or risk exacerbating by bringing development and people into the area affected. For example, the EIR should evaluate any potentially significant direct, indirect, or cumulative environmental impacts of locating development in areas susceptible to hazardous conditions (e.g., floodplains, coastlines, wildfire risk areas), including both short-term and long-term conditions, as identified in authoritative hazard maps, risk assessments or in land use plans addressing such hazards areas.*

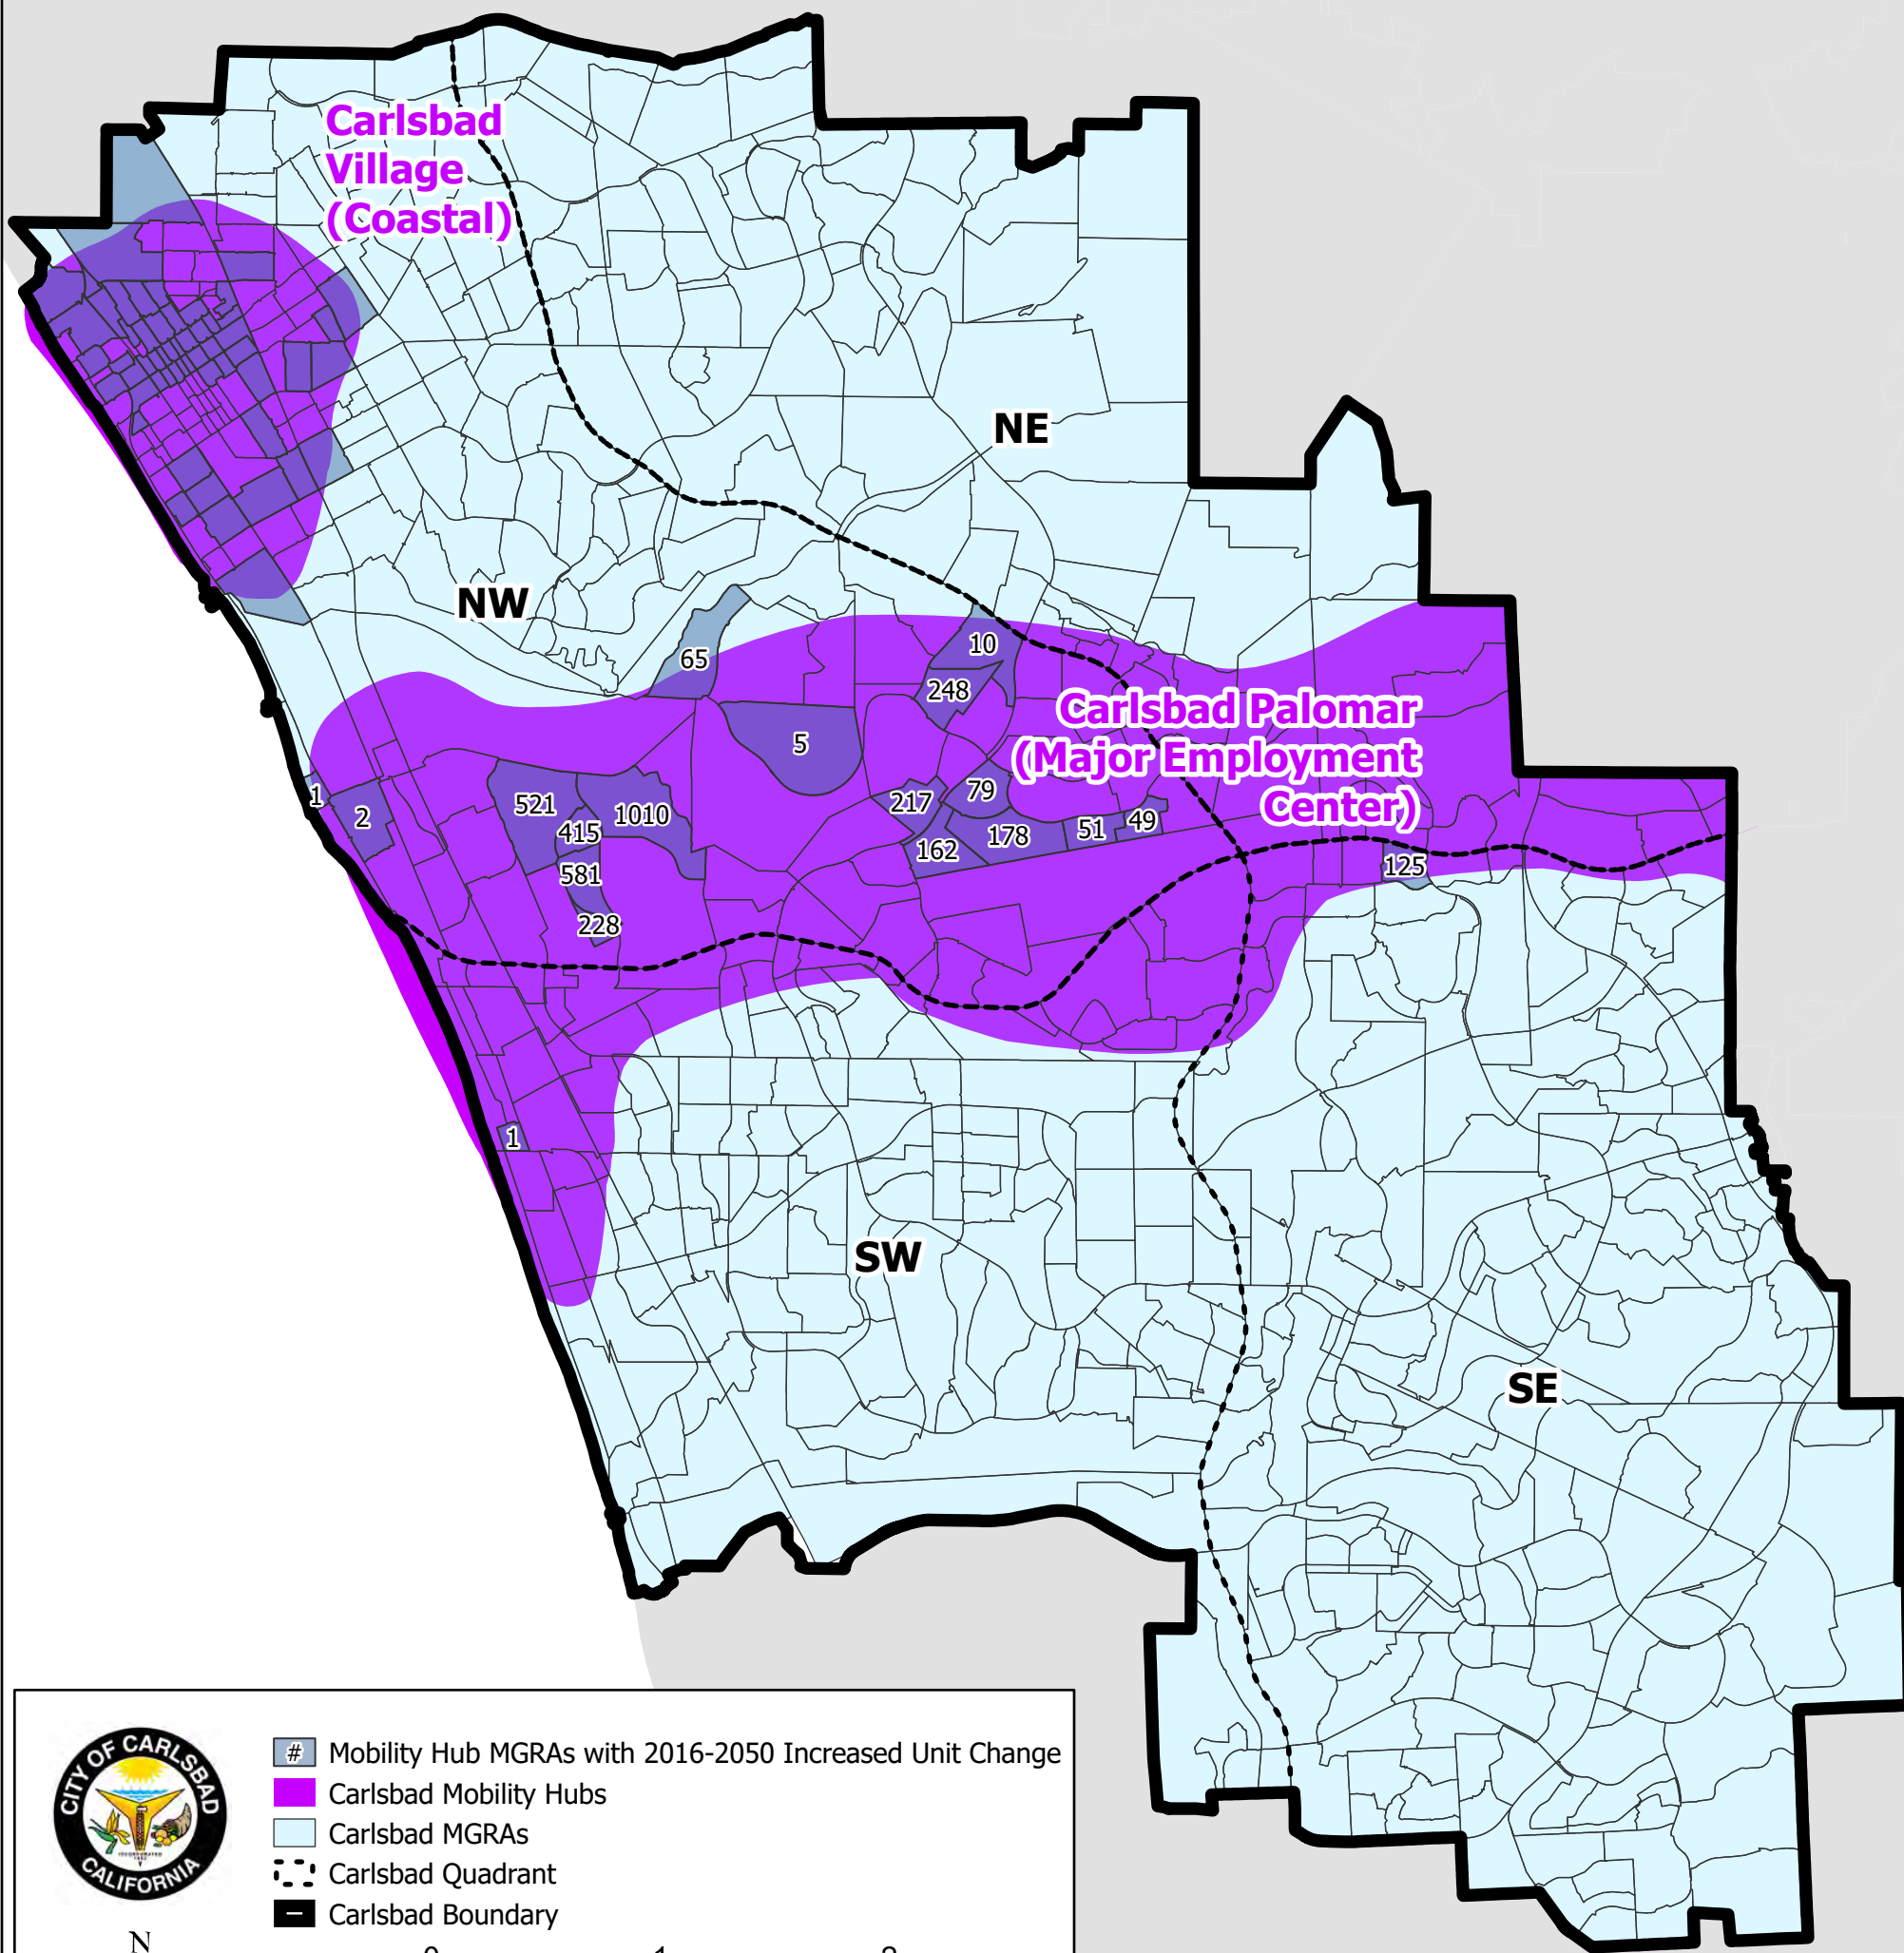

Since the new land use assumptions are being utilized, as described by this letter, the EIR that is prepared shall also analyze any significant environmental effects the project might cause by bringing development and people into the area affected. The following are the basic steps in analyzing land use impacts as part of the community impact assessment process:

## Attachment 1: Government Code 65020 (S.B. 375) Summary

1. Inventory the existing land use patterns (including undeveloped land), development trends, and transportation systems. The inventory of existing land uses should include the following land use types: residential, commercial, industrial, recreational, institutional, public services, community services, emergency services, transportation, utilities, agriculture, and undeveloped land in the study area. The study area should include the surrounding community that is generally associated with the project area within which community impacts could occur. The inventory should also address development trends and identify recent developments in the study area to include the development's name, size, status (planned, built, under construction), and the jurisdiction in which it is located. A map showing the location of existing and planned land uses in the area should also be prepared.
2. Determine whether the project is consistent with local and regional policies that govern land use and development. For the consistency analysis, the policies and programs considered in the analysis should include: transportation plans and programs (MTPs/RTPs and MTIPs/RTIPs), regional growth plans, local General Plans that establish land use and growth management policies for the study area, and any specific or pipeline development proposals. This analysis should also include a discussion of consistency with the Coastal Zone Management Act of 1972, California Coastal Act of 1976, the National Wild and Scenic Rivers Act (16 USC 1271) and the California Wild and Scenic Rivers Act (Pub. Res. Code § 5093.50 et seq.). After preparing a preliminary list of relevant plans to be considered in the analysis, the SANDAG planner should meet with the staff of the various agencies to review the list to determine if it is complete and revise the list as necessary.
3. Assess the changes that would occur in land uses and growth with and without the project.
4. The draft Regional plan and each project alternative should be considered separately since the results may be different.
5. Develop measures to avoid, minimize, and/or mitigate potential adverse effects.

The resulting environmental analysis should identify the current development trends and the State and/or local government plans and policies on land use and growth in the area which will be impacted by the proposed project. These plans and policies are normally reflected in local General Plans. If found to be consistent, then the findings in the EIR should be documented in the report and no further analysis or action is necessary. When found not to be inconsistent with a policy or program, then consideration must be given to modifying the draft Regional Plan alternative to make it consistent, or measures to address the inconsistency must be developed. SANDAG should be actively engaged in the development of measures to address these issues and be prepared to assess the consistency of the draft Regional Plan and alternatives with the comprehensive development plans adopted for the area and (if applicable) other plans used in the development of the transportation plan required by Section 23 U.S. Code § 134. For any new land use growth assumptions, the secondary social, economic, and environmental impacts of any substantial, foreseeable, induced development should be presented for the draft Regional Plan and each alternative, including adverse effects on existing communities. The results should be shared with the public during the public involvement process, e.g., at community meetings, etc. Public input should be considered by SANDAG and if necessary, the findings of the analysis should be revised to reflect information gained through the public involvement process.

**Subject:** Comments on the San Diego Forward: 2021 Regional Plan

Dear SANDAG staff:

Thank you for the opportunity to review the San Diego Forward: 2021 Regional Plan (2021 Regional Plan). The City of Coronado (City) appreciates SANDAG's ambitious plan to improve the San Diego region's mobility options, reduce greenhouse gas emissions, address traffic congestion, advance technology related to transportation services, and improve regional transportation infrastructure. While the City is generally supportive of the 2021 Regional Plan, there are several areas of concern, including the inclusion of a mobility hub in the Orange Avenue Business District / village area, the potential for housing unit allocation to increase given the inclusion of a mobility hub, the assumption that the 2021 Regional Housing Needs Allocation (RHNA) is final, the depiction of new mixed use areas in the City, and the strategy of minimum zoning near transit. These main concerns are summarized below.

First, and most notably, during the South Bay to Sorrento Comprehensive Multimodal Corridor Plan (CMCP) engagement process, City staff expressed concern about the Orange Avenue Business District / village area being designated a Mobility Hub without meaningful engagement with City residents and the City Council. It is highly unlikely the City would agree to construction of a new mobility hub in the Orange Avenue corridor. Therefore, the City requests the mobility hub be removed from both the South Bay to Sorrento CMCP and the 2021 Regional Plan.

As stated in the City's "Comments on the South Bay to Sorrento Comprehensive Multimodal Corridor Plan" letter dated July 7, 2021, the City has about 23,639 residents (ACS 2019) and a compact, fully developed village area covering about two square miles surrounded by the San Diego Bay and the Pacific Ocean. The City is highly constrained and does not have additional development capacity or any buffer zones to establish a mobility hub in our village area. While the City is supportive of on-demand travel options, it is difficult to imagine where facilities for the "Flexible Fleets" and "Transit Leaps" might be sited, such as ride hailing zones, electric vehicle charging stations, micro-mobility parking areas, parcel delivery lockers, and sidewalk delivery bots. The description of mobility hubs also includes drone technology, which is a concern given the proximity to Naval Air Station North Island (NASNI).

The designation of the City's village as a mobility hub is also concerning as it relates to the future of housing allocations for Coronado. Presumably, given the State and SANDAG's priority to increase housing density in transit rich areas, mobility hubs and related transportation investment may have a significant adverse impact in Coronado's village area. The 2021 Regional Plan refers to mobility hubs as areas "to concentrate future development." The City is concerned that the designation of the village area as a mobility hub will lead to continued increased regional housing needs allocations, which will negatively impact the City's character, in addition to the challenge of space and regulatory limitations to accommodate more high-density housing.

In the event that the village area continues to be designated as a mobility hub, the City asks that the use of drone security be removed from the plan due to privacy and safety concerns, that the use of e-bikes or scooters be limited and orderly, and that new facilities not block or impede pedestrian movement. Finally, before any strategies are implemented within the village area, more public outreach and interagency collaboration will be required to inform Coronado residents of the plan.

In addition to the City's concern for a mobility hub in the village, the City finds that the 2021 Regional Plan presupposes that 2021-2029 RHNA is finalized although there is pending litigation related to the RHNA. To address this issue, the City asks that the following language be inserted as a footnote on p.33 of the 2021 Regional Plan, after the sentence: "The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation" to read:

*In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board's adoption of the RHNA Plan. SANDAG demurred to the cities' Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition, and that appeal remains pending in the Fourth District Court of Appeal.*

In addition, the City proposes to add the the following paragraph to the end of p.14 of Appendix K:

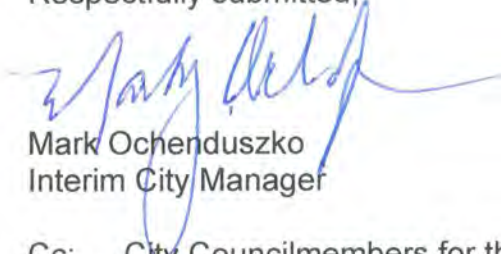

*On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL, against SANDAG and SANDAG's Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and decide the cities' appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG's denial of the cities' RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities' RHNA appeals. On February 5, 2021, SANDAG's demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board's adoption of the RHNA Plan cannot be considered final.*

Aside from the main concerns of the village area as a potential mobility hub and the presupposition of a finalized RHNA, the City has additional comments about the 2021 Regional Plan:

- A new Rapid route is depicted from Downtown to NASNI. The City would be interested in extending this route further into the commercial village area.
- The description of the Transportation Demand Programs includes language that suggests that employers will be required to provide transportation benefits. The City does not support requiring local businesses to provide specific benefits and would not enforce this or any other mandatory regulatory actions.
- Appendix A identifies a new off-street bike path on Glorietta Boulevard. The City's Active Transportation Master Plan does not identify such a future improvement, the Bayshore Bikeway Plan recommends no changes to this area, and there is already a bike lane on Glorietta Boulevard. Please update A.12 and A.13.
- In Appendix B one of the strategies to increase housing affordability is to minimize zoning near transit. Since most of the village area is near transit, the City would not implement strategies that adversely alters its community character through reduced zoning requirements or eliminated single family zoning.
- In the land use maps in Appendix F, there are some areas of Coronado shown as mixed use. Although there is some existing, non-conforming mixed-use development in the City, there are no areas in the City that are zoned for mixed use, and there are no plans to zone additional areas for new mixed-use.
- The City generally supports improvements to the public transportation system, but encourages SANDAG to do so in a manner that does not compromise necessary road maintenance and improvement projects.
- The City also supports new waterborne transportation options, such as ferry routes, and encourages SANDAG to prioritize the financing and expansion of waterborne transportation options in its regional planning documents.

Once again, thank you for the opportunity to comment on the 2021 Regional Plan. We look forward to seeing an amended plan in the future.

Respectfully submitted,

A handwritten signature in blue ink, appearing to read "Mark Ochendusko", with a long horizontal flourish extending to the right.

Mark Ochendusko  
Interim City Manager

401 B Street, Suite 800  
San Diego, CA 92101

RE: San Diego Forward: The Regional Plan

The City of Oceanside Planning Division appreciates the opportunity to provide comment on the Draft 2021 Regional Plan.

- **Chapter 1: A Bold New Vision for the 2021 Regional Plan**

- We applaud SANDAG for prioritizing public safety, solutions to traffic congestion, social equity, GHG emission reduction, and air quality. We recommend that SANDAG also acknowledge open space and natural habitat preservation as a key priority of the Regional Plan. The long-term sustainability of the San Diego region, along with the quality of life of its residents, depends on the preservation of these resources. How will the San Diego region help to further the state's "30 by 30" goal, as outlined in Executive Order EO N-82-20?
- We encourage SANDAG to consult with the scientific community on the most recent sea level rise projections for the region's coastline. It is our understanding that NASA now projects sea level rise of less than one foot by 2050, based on roughly three inches of sea level rise over the past decade. While there are many factors that could contribute to significantly greater sea level rise over this period, we believe it important to base regional planning efforts on the most likely sea level rise scenario.
- The modest goals for mobility mode shift over the planning period (reducing SOV commutes by 18% and increasing transit ridership by 10%) do not seem commensurate with the major changes the Five Big Moves would bring to the region. What are the main impediments to achieving more ambitious mobility mode shift goals? What strategies, if any, are available to overcome these impediments?
- The regional population forecast for this iteration of the regional plan shows substantially less population growth through 2050 than that projected in prior forecasts. Should this most recent growth forecast prove accurate, there will inevitably be less tax and user fee revenue to support the region's transportation system. To what extent has lower population growth, and concomitant lower regional funding, been factored into the economic analysis of the Five Big Moves?
- It is noted that over the next three decades 60% of the region's population growth will be among those who are 75 years old and older. How well do we understand the current and evolving mobility needs and preferences of this demographic, and

how will transportation infrastructure and services be designed to accommodate these needs and preferences? How will the region's elderly population benefit from active transportation improvements? How will the elderly access transit? What accommodations will need to be made to ensure that the elderly have equal access to the region's mobility network?

- **Chapter 2: Sustainable Communities Strategy (SCS)**

- The Draft SCS establishes the overarching goal of a fast, fair, and clean mobility network. It will be important to devise and consistently apply appropriate metrics for evaluating how mobility improvements and services further this goal.
  - With regard to the relative speediness of new or enhanced mobility options, it would be worthwhile to consider how travel times associated with alternative modes compare with those associated with SOV automobile trips.
  - In addition to evaluating the fairness of a particular improvement or service in terms of access, cost, and functionality, it would be worthwhile to also consider the relative safety and comfort of mobility options as experienced by different user groups.
  - While air quality and GHG emissions are fundamental considerations in determining the cleanliness of the mobility network, so too are water quality, soil quality, hazardous materials, and solid waste management.
- While user fees are both an important revenue source and a potentially powerful means of encouraging more sustainable modes of transportation, it is important that such fees not create financial hardship for lower-income households. To avoid a regressive and inequitable user fee regime, subsidies should be provided to those with both limited financial means and limited mobility options.
- The efficient movement of goods into and through the San Diego region is essential to the health and stability of the regional economy. Assessment of the efficiency of goods movement should consider how delivery systems contribute to overall VMT and how these systems can further evolve to minimize their environmental impacts, including their contributions to traffic congestion, air pollution and GHG emissions, roadway wear-and-tear, and noise.
- Preparation and implementation of the sub-regional Comprehensive Multimodal Corridors Plans (CMCPs) is identified as a priority in the Draft Regional Plan. Oceanside staff has been participating in task force meetings on the North County CMCP. In these meetings, we have noted that Caltrans facilities that extend through Oceanside often serve as barriers to active transportation and connectivity between neighborhoods. For example, SR 76 bifurcates neighborhoods in the San Luis Rey Valley, separating residents from commercial areas, recreational facilities, and other community assets. The absence of grade-separated crossings on SR 76 contributes to the highway's impact as a physical and psychological

barrier. The Planning Division recommends that improvements to SR 76, SR 78, and I-5 incorporate new and upgraded pedestrian and bicycle facilities that enable safer and more convenient crossings of these roadways.

- To a large extent, the success of mobility hubs will depend on the level of comfort and engagement they provide to those who travel through them. The design of mobility hubs should therefore emphasize safety, security, accessibility, visual quality, and a strong sense of place. Mobility hubs have the potential to serve as gathering spaces, cultural venues, and entertainment districts. Improvements and services within mobility hubs should contribute to, and not detract from, the character and appeal of these areas.
- It is noted that the Draft Regional Plan considers air pollution exposure reduction strategies promulgated by AB 805 and other state legislation and guidance. While most of these strategies rightly focus on underserved communities, it is important to note that as smart growth takes hold in the region and new housing is built in closer proximity to major roadways and transit facilities, residents across the socioeconomic spectrum could be exposed to excessive levels of air pollution. As we facilitate cleaner forms of transportation, we can also consider ways to enhance both indoor and outdoor air quality in highly urbanized areas through landscaping, ventilation systems, weather-stripping, etc.
- State Route 76 is identified in the SCS as a “rural corridor.” While much of this highway extends through rural areas, most segments of SR 76 in Oceanside abut urbanized areas. Accommodating both pass-through and local trips, these segments of SR 76 could benefit from some of the same improvements and programming slated for other highways in the region.
- Consider Oceanside as a testing ground for the piloting of Next OS technologies, particularly those that serve lower-income residents and those who reside in areas with limited transit options.
- In partnership with the Orange County Transit Authority (OCTA) and NCTD, consider rapid bus service between southern Orange County and the Oceanside Transit Center.
- The SCS calls for implementation of “innovative demand and system management” programs. The City of Oceanside has recently adopted TDM standards for new non-residential development of certain types and scales. The City is also exploring possible incentives for TDM in existing non-residential development. Regional funding and/or technical support for TDM plans would be a powerful incentive for existing businesses to consider ways to promote alternative commuting options.
- As other local jurisdictions have done, the City of Oceanside intends to reduce lanes and implement roundabouts within one of its major commercial corridors (Coast Highway). One of the biggest challenges to implementing “road diets” is maintaining adequate right-of-way for buses and ample curb space for flex fleet service. Regional guidance on road diet design that supports alternative mobility

options, developed in partnership with regional transit and flex fleet providers, would be helpful.

- The proliferation of warehousing and distribution facilities in the San Diego region has major implications for land use, economic development, and climate mitigation. These facilities tend to occupy large tracts of land while providing relatively few jobs per acre. Vehicle trips generated by these facilities can contribute significantly to VMT and associated GHG emissions. We encourage SANDAG to consider guidelines and incentives that promote innovation in the warehousing and distribution sector (e.g., more efficient land use, zero-emission vehicle fleets, etc.).
- Value pricing of public parking facilities is key to facilitating efficient use of these resources, generating revenue for local transportation improvements, encouraging alternative modes of transportation, and motivating efficient use of private parking facilities. While parking pricing is largely within the authority of local jurisdictions, SANDAG can support localities in navigating the technical and political challenges of implementing value pricing programs.
- **Chapter 3: Paying for the Regional Plan, Forming Partnerships and Taking Action, and Monitoring How the Plan Performs**
  - Performance monitoring, as illustrated in Table 3.1, should include public health benchmarks, particularly those that provide insight on the public health impacts of air pollution, lack of access to healthy food, sedentary lifestyles, etc.
- **Appendix A: Transportation Projects, Programs, and Phasing**
  - In Figure A.1, SR 76 and SR 78 are not identified as significant corridor geographies, while SR 56, SR 94, and SR 125 are identified as such. The Planning Division recommends that these two important regional roadways be identified in the same manner as other east-west highways in the region.
  - As identified in Table A.11, the Inland Rail Trail (IRT) through Oceanside is not shown as being implemented until 2035. The IRT is a crucial component of the North County bicycle trails network, facilitating access to NCTD Sprinter rail and Breeze bus services, connecting cyclists to the Coastal Rail Trail, activating north-south bikeways (e.g., El Camino Real, College Boulevard), and contributing to complete streets improvements within the Oceanside Blvd corridor. The Planning Division thus recommends that the Draft Regional Plan commit to implementation of this segment of the IRT by 2025.
  - The Planning Division recommends that acquisition of land in mobility hub areas be identified as a higher priority, as property aggregation will be key to efficient redevelopment of many of these areas.
  - The extension of Melrose Drive and the interchange at Highway 78 and Rancho del Oro are not listed among the arterial improvements in Table A.13. Both of these

improvements are listed in the City's Circulation Element (CE). While the City is currently contemplating removal of the extension from Santa Fe Avenue to Spur Avenue from the CE, the unconstructed segment between North River Road and State Route 76 will remain.

- **Appendix B: Implementation Actions**

- Implementation Action 9 calls for expansion of regional programs on low-carbon transportation options, roadway safety and maintenance, and nature-based climate solutions. While the Planning Division supports nature-based climate solutions where feasible, we note that certain stretches of the region's coastline face imminent threat from coastal hazards and are not amenable to nature-based solutions. The Planning Division encourages SANDAG to support near-term coastal adaptation measures that address urgent local conditions and buy time for the development and implementation of long-range adaptation strategies.
- In addition to the enumerated strategies to increase housing availability and affordability (p. 19), the Planning Division encourages SANDAG to consider gap financing for inclusionary housing projects that do not qualify for tax credit financing and/or other federal and state subsidies. In determining eligibility for gap financing, SANDAG should consider key sustainability metrics – e.g., proximity to transit, employment, and essential services, energy efficiency and renewable energy sourcing, pedestrian-oriented design, resilient building materials, etc.
- The Planning Division applauds SANDAG for recognizing that the relatively low resale value of certain electric vehicles presents an opportunity for lower-income households to enter the electric vehicle market. SANDAG can further support EV ownership in low-income and historically disadvantaged communities by coordinating with dealerships in the region on marketing and financing programs.
- The “Fix It First” implementation strategy is described as “bringing transit and road infrastructure back to optimal performance.” The Planning Division questions the notion that the region's mobility infrastructure has ever demonstrated “optimal performance.” Perhaps a better catch-phrase here would be something akin to “Build Back Better,” as this speaks to more than just perpetuating the status quo.
- In its consideration of tools and strategies that provide for the effective operation and management of regional infrastructure as a coordinated system, SANDAG should work closely with local jurisdictions to identify, enhance, and integrate local data collection and traffic management programs into a regional whole. The City of Oceanside maintains a Traffic Management Center that, with adequate staffing, has the potential to provide real-time traffic data to support signal optimization and other efficiencies.

- **Appendix F: Regional Growth Forecast and Sustainable Communities Strategy Land Use Pattern**
  - The Planning Division is concerned that the most recent iteration of the regional population forecast may significantly underestimate Oceanside’s capacity for additional population, housing, and employment. We understand that the statewide forecast prepared by the Department of Finance shows considerably less growth in the San Diego region over the next three decades than previously anticipated, and we acknowledge that population and housing growth in Oceanside has been declining over the past 20 years. Nevertheless, housing demand in Oceanside remains strong, and the City is still one of the most affordable housing markets in the San Diego region. Moreover, the local employment base continues to grow, particularly in the manufacturing, health care, and hospitality sectors. We believe Oceanside has the potential to accommodate significant growth through infill and redevelopment, and that the revitalization of the City’s urban corridors will draw new residents and employers. The City’s outdated General Plan has likely contributed to low growth projections over the past three forecast periods (2008, 2012, and 2016). The City is currently in the process of updating its General Plan, with the intent to incentivize infill and redevelopment through new zoning standards, a streamlined review process, CEQA clearance, and targeted infrastructure improvements.

The City of Oceanside Planning Division again thanks SANDAG for the opportunity to comment on the Draft Regional Plan. Planning staff looks forward to working with SANDAG on the refinement and implementation of this important document. Questions and comments can be directed to Russ Cunningham at [rcunningham@oceansideca.org](mailto:rcunningham@oceansideca.org) or (760) 435-3525.

Sincerely,

Russ Cunningham, Principal Planner

San Diego, CA 92101

**RE: San Diego Forward: The 2021 Regional Plan**

The City of Oceanside Traffic Engineering Division appreciates the opportunity to provide comment on the Draft Regional Plan.

1. The SANDAG website states, "The SANDAG Sustainable Communities Strategy and Final EIR from its 2015 Regional Plan will remain valid and in compliance for purposes of state funding eligibility and other state and federal consistency purposes until the SANDAG Board of Directors adopts a new Regional Plan and EIR, provided those actions are completed by the end of December 2021." SANDAG needs to clarify how the Draft EIR, Response to Comments and Adoption will be completed this year and what will occur if they are not completed by the end of this year. SANDAG should also clarify how comments on the plan are going to be addressed in the Draft EIR prior to its release.
2. Looking at the detailed data provided by SANDAG it is not clear why the citywide numbers only show moderate increases in population. See comments provided by the City's Planning Division.
3. In *Appendix A: Transportation Projects, Programs, and Phasing*, it should be noted that Trips to and from school sites result in a significant congestion, VMT generation, and peak hour delay throughout the region. Additional funding and projects should be recommended with a specific focus on improving safety and multimodal access in and around school sites along with programs to incentivize non-single occupancy vehicle trips to schools.
4. Considering FHWA's project for Accelerating Roundabout Implementation in the United States, and the County of San Diego Air Pollution Control Board's support for implementing roundabouts to address GHG and reduce fatalities, the Plan should incorporate policies to promote roundabouts over signalized intersections and include a line item under the Complete Corridors to fund the construction of roundabouts at new locations and replace signalized intersections when found feasible.

Specific Comments on the Appendices

**Appendix A: Transportation Projects**

Descriptions of the following projects are insufficient. In order to provide comments, the City requests that SANDAG provide more detailed project description, information and clarifications for the following projects:

Oceanside Active Transportation Projects

1. **AT030: Coastal Rail Trail Oceanside- Alta Loma Marsh Bridge 2035.**

The Regional Plan's cost estimate is \$4 million. The actual estimate prepared by the City is \$9 million. Please clarify or correct.

2. **AT031: Coastal Rail Trail Broadway to Eaton 2035.**

The project cost is estimated at \$1 million. The Regional Plan recommends trail extension to Eaton Street, with Eaton providing connection to the existing Coastal Trail segment on Coast Hwy. The City's preferred routing is to extend this trail to the south end of Broadway, then obtain easement from the Buena Vista Audubon Society to continue the trail along the lagoon to connect to the Carlsbad section of the Coastal Rail Trail. We recommend the project description be amended accordingly. We also believe that a higher cost estimate needs to be included; \$1M is not an accurate cost estimate for this project.

3. **AT049: Inland Rail Trail 2035.**

The project cost is estimated at \$68M. It is difficult to evaluate the accuracy of this cost estimate without a preliminary engineering study of the potential alignments and the actual field conditions. It is likely the cost of this project will exceed \$70M.

4. **AT074: Coastal Rail Trail-Oceanside Segment 1ALT 2050.**

The project cost is estimated at \$6 million, with on-street routing from Neptune/Pacific to the NCTD station. It is difficult to assess this potential trail routing and the project's impacts potentially creating a need for street widenings in that area.

5. The City requests that the following two projects be added to the Regional Plan:

A. **A connection between the west and east side of I-5 at the SR-78 interchange for bicycle and pedestrian traffic.** Under existing conditions, there is no safe access for bicyclists and pedestrians across I-5 in this area.

B. **Bike infrastructure improvements on SR-76,** as repeatedly requested by Caltrans and the City of Oceanside.

**Appendix L: Oceanside Workshop**

The recommendations made in this section are the results of a conceptual community workshop on what might be considered, and the following recommendations mentioned in this appendix as

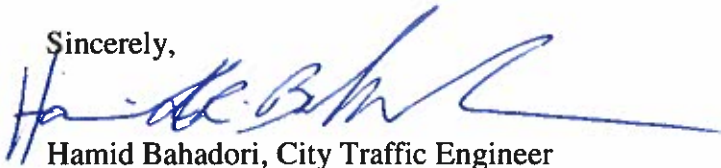

a result of this workshop shall by no means be construed as the City of Oceanside's official request and/or recommendations:

- Oceanside Boulevard reduced to two lanes with protected bikeways.
- The Strand closed to vehicle traffic and available only for bikes and pedestrians.

The City of Oceanside Traffic Engineering Division welcomes the chance to work with SANDAG staff and other stakeholders to ensure that the City's mobility needs and concerns are adequately addressed in the updated Regional Plan.

Sincerely,

A handwritten signature in blue ink, appearing to read 'Hamid Bahadori', with a long horizontal flourish extending to the right.

Hamid Bahadori, City Traffic Engineer

**Subject:** 2021 Regional Plan Comments - City of Poway

**CAUTION: This email originated from outside of SANDAG. Do not click links or open attachments unless you are expecting the content.**

Thank you for allowing us to submit comments on the Draft 2021 Regional Plan.

Regarding Scripps Poway Parkway, the City of Poway would like to see vehicle, bike, pedestrian and transit infrastructure improvements and connections to be added from the Highway 67 through Scripps Poway Parkway to the I-15 Freeway. I have spoken to several property and business owners within the South Poway Business Park (SPBP) including Geico and parking is a constant issue. There is currently no public transit route into the SPBP. Having public transit, bike, pedestrian and highway/road improvements/connections providing better more efficient access to the SPBP is essential for future employment growth in the area. Many workers in the Poway area live in Ramona and East County and this is a vital connection for the City and the Region. SANDAG has also identified Scripps Poway as a Tier 3 employment center in their draft Employment Center analysis. Construction is also underway to add thousands of more employees in the SPBP. To be clear, we are recommending that Scripps Poway Parkway become a critical connection and a multimodal corridor ([https://www.sandag.org/uploads/publicationid/publicationid\\_4720\\_28341.pdf](https://www.sandag.org/uploads/publicationid/publicationid_4720_28341.pdf)).

Regarding the Hwy 67, please note that the City of Poway's General Plan Transportation Element includes a multi-use path on the west side of SR-67 (reference p. 3 <http://docs.poway.org/weblink/0/doc/50446/Electronic.aspx>). This multi-use path would include a separated two-way bike path and a fenced DG equestrian trail. The multi-use path provides a critical and safe pathway for hikers, bikers, runners, walkers, children, and equestrians. A multi-use path also creates a necessary loop between the City's Iron Mountain trailhead and other destinations (e.g., Mt. Woodson, Lake Poway) which is also a goal within the Transportation Element. We recommend the San Vicente corridor plan is consistent with the City's plans.

State Route 67 is also designated as a scenic roadway by the Poway General Plan. As a part of the General Plan requirements, a 50-foot wide landscape open space easement is required from adjacent property owners from the ultimate right-of-way line along State Route 67 when development is proposed. This easement shall be landscaped and modified as needed to enhance the scenic quality of the area as discussed in the General Plan Transportation Element Policy B – Scenic Roadways. Providing scenic roadway elements to the design will also help the corridor be more compatible with surrounding open space. To contribute to the General Plan goals, we would suggest that the right-of-way incorporate design elements consistent with a scenic roadway (e.g., naturalized decorative solid walls, native landscaped medians and shoulders, additional landscape areas and trees where feasible, earthen berms).

As a part of the San Diego Forward Plan and the 5 Big Moves Plan, SANDAG established the SR-67 corridor as a Comprehensive Multimodal Corridor Plan (CMCP) calling for a multimodal road along the SR-67 ([https://www.sdforward.com/docs/default-source/default-document-library/agenda-june-5-2020.pdf?sfvrsn=891afe65\\_4](https://www.sdforward.com/docs/default-source/default-document-library/agenda-june-5-2020.pdf?sfvrsn=891afe65_4)). As stated on p. 6-2 of the 2050 RTP, "Our region has consistently supported a multimodal approach to transportation that looks at the overall system and improvements that benefit all modes, rather than prioritizing one over the other. This approach gives all of the transportation system users choices traveling within and through the region." Further, "A well designed and thoughtfully integrated multimodal transportation system will give people choices, allowing them to select the transportation mode that is best suited for a particular trip. In an area as large and diverse as the San Diego region, this approach is necessary to make the best use of our limited

transportation resources.” As discussed, a multi-modal transportation system provides users transportation options and choices and thereby reduces traffic congestion and ghg emissions. Regional multi-use paths have been a great asset to communities across the country. Here in San Diego, the SR-56 Bike Path is separated from the highway and is often used by runners, walkers, and equestrians. In contrast, it is uncommon to see bikers, walkers, and equestrians in a bike route adjacent to a highway (for instance, SR-76). A multi-use path is also kid friendly because of the separation from the highway and kids are often seen on the SR-56 Bike Path and not commonly seen within bike routes adjacent to a Highway. The multi-use path also accommodates a more rural aesthetic and is safer for users. Multi-use paths have become a critical component to the transportation system and are treasured by the communities they are a part of. The addition of the multi-use path along Hwy 67 is more consistent with the goals and policies of the 2050 RTP. We recommend the San Vicente corridor plan provides a separated mixed-use path throughout the full length of the corridor.

Lastly, during the workshop portion for the Draft 2021 Regional Plan, workshops were provide by area (North, East, Central, etc.). Based on the mapped areas shown, Poway residents and community stakeholders were not represented as a part of any region and that outreach with appropriate comment period should be provided prior to moving forward with Draft. I'd be happy to assist you with what an appropriate outreach should be.

Thank you for considering our comments. Please feel free to reach out to me with any questions.

Thank you,

**David De Vries, AICP**

## Planning Department

August 6, 2021

Coleen Clementson  
Director of Regional Planning  
San Diego Association of Governments  
401 B Street, Suite 800  
San Diego, CA 92101

Dear Ms. Clementson,

Subject: San Diego Forward: The 2021 Regional Plan

I am writing to express the City of San Diego's support for SANDAG's San Diego Forward: The 2021 Regional Plan (2021 Regional Plan). The 2021 Regional Plan is a major step towards reducing vehicle miles traveled by single occupant vehicles and greenhouse gas (GHG) emissions in the region by incorporating five transformational strategies which will be critical to enabling the City of San Diego to implement its Climate Action Plan. The City applauds SANDAG's commitment to making infrastructure and technological investments in the mobility system with a greater emphasis on accessibility, transit, bicycling, and walking as well as innovative and bold strategies to manage demand on regional roadways prioritizing safety and aligning with the City's commitments to Vision Zero. The City's General Plan is consistent with the 2021 Regional Plan as both focus on development within vibrant mixed-use village centers served by high frequency transit. The City supports the 2021 Regional Plan's intent to preserve open space from non-sustainable development. The City looks forward to closely working with SANDAG to implement the strategies described in the 2021 Regional Plan.

The City supports the 2021 Regional Plan's vision to improve the transportation network in the region especially the planning and implementation of a complete network of efficient, convenient, and reliable transit services that connect people from where they live to where they work or go to school. The development of a dynamic management system of traffic flow and transit services, facilities for bicycles, scooters, pedestrians, and flexible micro transit, offer an equitable approach to first and last-mile connections to transit, a vision zero strategy to address safety, and implementation of the City's Climate Action Plan.

The City also supports the 2021 Regional Plan's development of mobility hubs throughout the region. As part of our land use planning efforts, the City is providing policies to support the implementation of mobility hubs as vibrant centers of activity where future housing and employment growth are connected by transit. The San Ysidro and Central mobility hubs are critical transportation facilities and having a direct connection to the U.S.-Mexico Border and San Diego International Airport is a vital step towards having a transit system that meets the needs of residents and visitors.

The City shares the 2021 Regional Plan's goal to provide better transit access and housing opportunities in employment centers. Over the past two years, the City has adopted updated Mission Valley and Kearny Mesa Community Plans to accommodate more housing and existing and future transit improvements in

August 6, 2021  
Ms. Coleen Clementson  
Page 2

high employment centers. We are also in the process of updating our community plans for University and Mira Mesa (Sorrento Mesa) which include major high-tech and biotech employment centers. These plans focus additional housing opportunities along existing and planned transit lines needed to support continued economic prosperity. Downtown San Diego has experienced a high level of residential growth as well as a recent resurgence of employment growth. The success of future housing and job growth in these employment centers is predicated on the implementation of rail transit, managed lanes, and bicycle networks, and the technological improvements to our regional arterials. These investments into our infrastructure will also provide jobs for the region's skilled labor force.

The City strongly supports efforts to increase mobility options including the development of high frequency transit in communities of concern with increased transit infrastructure and service needed to provide convenient access to job centers. The City recommends that SANDAG identify the planning and engineering of the commuter rail (purple line) between San Ysidro and Sorrento Valley, separation of existing light rail at-grade crossings, dedicated and/or flex lanes for Rapid Bus routes within the City, as well as double tracking the LOSSAN corridor as shovel ready projects for future state and federal funding.

The San Ysidro and Barrio Logan communities are affected by truck emissions due to their proximity to the U.S.-Mexico border crossing and the Port of San Diego respectively. The 2021 Regional Plan addresses the needs for air, rail, and port goods movement and smarter border strategies to support trade and international commerce. The City supports San Diego Forward's goals and policies to reduced air pollution which are needed to meet federal air quality conformity requirements and improve some of our most underserved, low-income communities.

The City has a long history of planning together with SANDAG to creating a land use pattern and transportation network that facilitates greater mobility and increased connectivity between employment and housing. The City encourages SANDAG to continue funding the Smart Growth Implementation Program which provides needed grant funding for planning and capital projects that support the implementation of the Regional Plan. We have included additional recommendations attached to this letter for SANDAG's consideration and look forward to partnering with SANDAG on its new Housing Incentive Program to achieve the goals of the Regional Housing Needs Assessment Plan. We are committed and look forward to a continued partnership with SANDAG on the long-term implementation of the San Diego Forward: The 2021 Regional Plan.

Sincerely,

Mike Hansen  
Director, Planning Department

### **City of San Diego's Specific Recommendations to the San Diego Forward: The 2021 Regional Plan**

- The City supports the planning and implementation of future rail projects identified in the 2021 Regional Plan. Appendix A, page A-15 on the note on the bottom of the page, please clarify if the purple commuter rail should be route 582 and not 581 as noted. Commuter rail route 581 as identified on page A-29, project TL-01 is Downtown to/from La Mesa projected to be in the 2050 transit network.
- The future purple commuter rail connection would provide access for people throughout the communities within the southern and central portion of the City to employment centers in Kearny Mesa, University, and Sorrento Mesa. The City recommends considering alignment and station options that would serve the Mid-City communities and SDSU West at Mission Valley. We look forward to working with SANDAG in reviewing ridership information/forecasts based on different proposed alignments for the entire line including with and without stations serving the Mid-City communities and SDSU West.
- The City looks forward to working with SANDAG in evaluating options for grade separation of existing light rail at-grade crossings within the City.
- The City recommends implementing near-term operational improvements such as the use of restriping for providing dedicated and/or flex lanes for Rapid Bus routes while planning for long-term capital improvements. We look forward to working with SANDAG in evaluating near-term and long-term options for dedicated and/or flex lanes for Bus Rapid routes.
- The City recommends including the Via Las Cumbres/I-8 Interchange/Hotel Circle North & South/Fashion Valley Road project in the list of proposed projects in Appendix A. As a regionally significant project that provides freeway and active transportation connections to two light rail transit stations and the San Diego River Trail. This will support the recently adopted Mission Valley Community Plan which increasing housing opportunities near the existing light rail stations.
- While the City supports increasing the amount of Transit Priority Areas (TPAs), the City requests that the existing TPAs be maintained in the 2021 Regional Plan. The TPAs are a critical part of the City planning process for future development to help meet our Climate Action Plan goals for the reduction of vehicle miles traveled. Maintaining future transit routes and the TPAs provides consistency in our land use and mobility planning efforts.

### **SUBJECT: DRAFT 2021 REGIONAL PLAN**

The City of Solana Beach appreciates the opportunity to review and comment on the San Diego Association of Governments (SANDAG) Draft 2021 Regional Plan (Draft Plan). It is clear that much time and effort went into this important document. Submitted for your consideration are the following comments:

- **Mobility Hubs** – Page 19 of Chapter 2 of the Draft Plan, the Sustainable Communities Strategy (SCS), describes planned “Mobility Hubs” as areas or communities in the region with “a high concentration of people, destinations, and travel choices” that “offer on-demand travel options and supporting infrastructure that enhance connections to high-quality Transit Leap services.” While the SCS seems to acknowledge that these Mobility Hubs can vary both in size and transit availability and can “span one, two or a few miles based on community characteristics,” the SCS and the Draft Plan do not separately categorize or discuss these Mobility Hubs based on these unique characteristics despite having done so previously as well as in Appendix T (Network Development and Performance). Pages 15 through 18 of Appendix T of the Draft Plan – Network Development and Performance – contains a Propensity Analysis for both Transit Leap Services and Mobility Hubs. These analyses identified which transit routes were most likely to meet the needs of transit riders now and in the future and which communities were most suitable for Mobility Hubs. While it should be noted that Solana Beach ranked at the lower end of both (see Figures 12 and 14), these analyses resulted in the apparent establishment of five (5) distinctive types of Mobility Hubs – Coastal, Gateway, Major Employment Center, Suburban and Urban Core – with Solana Beach identified in Figure 15 as a Coastal Mobility Hub. However, the SCS contains no meaningful discussion of these distinctive and unique Mobility Hub areas referring to them only in Figure 2.5 of the SCS where projected future growth is illustrated. The dramatic difference in projected future growth for each of these distinct Mobility Hub Areas, with Coastal Mobility Hubs well below the other four Mobility Hub Areas in both the percentage of future housing and future jobs (5% and 2%, respectively), clearly demonstrates their

uniqueness with respect to jobs, housing and access to high-quality transit and the extent to which each area should be relied upon (or not) to satisfy the region's future growth.

The adopted 2021 Regional Transportation Plan (Adopted Plan) and the SCS should contain a detailed discussion of the five (5) Mobility Hub Areas and a description of the unique characteristics and transit needs for each – both now and in the future.

Additionally, by virtue of the fact that the Solana Beach Train Station is within 2 ½ miles of the cities of Del Mar, Encinitas and San Diego and the County of San Diego, this regional Coastal Mobility Hub Area in the Adopted Plan should, for purposes of planning for future housing and job growth, extend into and cover the City of Del Mar and the Del Mar Fairgrounds and areas of the cities of Encinitas and San Diego and the County of San Diego immediately adjacent to Solana Beach.

- **Transit Leap Services** – As noted above, the Propensity Analysis discussed in Appendix T for both Transit Leap Services and Mobility Hubs determined that Solana Beach and its Train Station were at the lower end in the region both in meeting the needs of transit riders now and in the future and for suitability as a Mobility Hub. While the City acknowledges that the presence of the Train Station in Solana Beach might make it reasonable to include as a potential future Mobility Hub in the Adopted Plan, during the recent Regional Housing Needs Assessment (RHNA) allocation process, the City also made it clear that, both now and in the near term, the Train Station does not currently provide adequate Coaster or Amtrak headways, nor does it provide meaningful connections to other transit services to be considered a Mobility Hub now. Indeed, despite the North County Transit District (NCTD) Board recently voting to increase Coaster service beginning in October 2021, such a designation is still largely aspirational. While, again, the City acknowledges that the Draft Plan and the Adopted Plan are just that – a plan for the future – Appendix A of the Draft Plan – Transportation Projects, Programs, and Phasing – appears to support this position. Table A.5 (Interstate 5 North Coastal Corridor) identifies one Transit Leap project (TL40) – *Rapid 473* – for implementation in the year 2035. Similarly, Table A.9 (State Route 56) identifies one Transit Leap project (TL026) – *Rapid 103* – for implementation in the year 2050. These 15 to 30-year forward-looking Transit Leap projects, while helpful for the future, do not appear to satisfy the near-term objectives of a Coastal Mobility Hub.

In order to justify the designation of the Solana Beach Train Station as a Coastal Mobility Hub, both now and in the future, more immediate Transit Leap service connections should be considered for inclusion in the Adopted Plan.

**Appendix B: Implementation Actions** – Appendix B provides detail on commitments and key actions to implement elements and strategies of the Draft Plan. Key to this objective is the involvement of and coordination with each member agency as they are most knowledgeable of the needs of their respective communities. Indeed, Near-term Implementation Action No. 2 in Table B.1 identifies the need to partner with local governments to develop five initial Comprehensive Multimodal Corridor Plans (CMCPs). Therefore, the City requests that the following minor edits to Appendix B (page 16) under “Land Use and Regional Growth” be included:

“The 2021 Regional Plan vision for land use focuses on development and growth in ~~Mobility Hub areas~~ urbanized areas near jobs to preserve San Diego’s open space and support transportation investments by reducing vehicle miles traveled (VMT). Mobility Hubs are ~~the~~ an opportunity to provide housing to address the Regional Housing Needs Assessment. Land use authority is reserved to local jurisdictions because they are best positioned to effectively implement the objectives outlined in the 2021 Regional Plan through understanding of the unique needs of their communities and geographies. Because land use authority is reserved to local jurisdictions, SANDAG will leverage partnerships with cities and the county through the Smart Growth Incentive Program and other grants to provide funds for transportation-related improvements and planning efforts that support smart growth in Mobility Hubs to realize ~~this their~~ their vision for their communities. SANDAG will continue its existing grant programs, partner with member agencies on state funding opportunities, and provide data and technical support to assist local jurisdictions with land use planning efforts in line with the 2021 Regional Plan.”

- **Regional Housing Needs Assessment** – Following adoption of the Draft RHNA allocation by the SANDAG Board in September 2020, appeals of the allocation were filed by the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach. In order that these appeals are correctly noted for the record, there are two locations in the Draft Plan to which a clarifying footnote and additional language should be added to the Adopted Plan. Specifically, the City requests the following for the Adopted Plan:

- On page 33 of the Draft Plan, after the sentence: “The SANDAG Board of Directors adopted the RHNA Plan on July 10, 2020, with the final housing unit allocation” the following footnote should be added:

*\* In September 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court challenging, among other things, the Board’s adoption of the RHNA Plan. SANDAG demurred to the cities’ Petition and the demurrer was sustained by the court in February 2021. The petitioning cities have*

*appealed the ruling on the demurrer to their Writ Petition, and that appeal remains pending in the Fourth District Court of Appeal.*

- o On page 14 of Appendix K (Regional Housing Needs Assessment Plan), the following paragraph should be added to the end of this page/section:

*On September 24, 2020, the cities of Coronado, Imperial Beach, Lemon Grove and Solana Beach filed a Petition for Writ of Mandate in San Diego Superior Court, Case No. 37-2020-00033974-CU-MC-CTL, against SANDAG and SANDAG's Board of Directors seeking an order requiring that SANDAG give those cities a fair hearing on their RHNA appeals and decide the cities' appeals in a legal manner without bias and without the use of the weighted voting mechanism. Specifically, the petitioning cities asked the court to order: (1) that the final RHNA allocation approval by SANDAG be rescinded; (2) that SANDAG's denial of the cities' RHNA appeals be rescinded; (3) that the appeals be remanded to SANDAG for fair consideration; and (4) that SANDAG be prohibited from utilizing a weighted vote on the cities' RHNA appeals. On February 5, 2021, SANDAG's demurrer to the Petition for Writ of Mandate was sustained by the Superior Court. The petitioning cities have appealed the ruling on the demurrer to their Writ Petition. That appeal remains pending in the Fourth District Court of Appeal. So long as the litigation is pending, the Board's adoption of the RHNA Plan cannot be considered final.*

Once again, the City of Solana Beach greatly appreciates the opportunity to review and comment on the Draft Plan. We also appreciate SANDAG's consideration of our comments and requested changes for inclusion in the Adopted Plan as noted above.

If you have any questions or comments, please feel free to contact Community Development Director Joseph Lim at [jlim@cosb.org](mailto:jlim@cosb.org) or 858-720-2434 or me at [gwade@cosb.org](mailto:gwade@cosb.org) or 858-720-2444.

Sincerely,

Gregory Wade  
City Manager

# SAVE OUR FOREST AND RANCHLANDS

May 26, 2021

***Via E-mail***

SANDAG Board of Directors  
401 B Street  
San Diego, CA 92101  
[clerk@sandag.org](mailto:clerk@sandag.org)

**RE: Transportation Network Scenarios for the 2021 RTP**

Save Our Forest and Ranchlands (“SOFAR”) and the Cleveland National Forest Foundation (“CNFF”), two organizations dedicated to progressive land use planning and the protection of vital natural resources, are submitting comments for the draft transportation network scenarios for the 2021 Regional Transportation Plan Update. We recognize that SANDAG, under its new leadership and with new board members, has undergone a tectonic shift towards building a regional transit system to serve the urbanized western section of San Diego County. The focus of this letter is centered on the required first step towards building a 21<sup>st</sup> Century regional mobility system, i.e., a first phase area- complete transit, bike, walk system in the urban core that is competitive with the auto.

Therefore, SOFAR and CNFF urge the SANDAG Board of Directors to include a Climate, Housing, Transit Alternative in the 2021 RTP update—an alternative focused on meeting both the housing needs and greenhouse gas (“GHG”) reduction goals for a qualified land use area that have been set collectively by the State of California, the City of San Diego, and SANDAG:

- 40% reduction in GHG below 1990 levels by 2030 (California AB 32 and SB 32)
- 80% reduction in GHG below 1990 levels by 2050 (Governors Schwarzenegger and Brown)
- 25% reduction in per capita GHG from passenger cars and trucks relative to 2005 by 2035 (California SB 375; California Air Resources Control Board<sup>1</sup>)
- 14.3% reduction in total daily VMT per capita, and 16.8% reduction in total light-duty VMT per capita, relative to 2015-2018 average by 2050 (California Air Resources Board)<sup>2</sup>
- 50% transit, walk and bike mode share for commuters within ½ mile of a major transit stop in City of San Diego by 2035 (Climate Action Plan, City of San Diego)<sup>3</sup>
- 150% increase in transit mode share (SANDAG’s *Urban Area Transit Study*)<sup>4</sup>

---

<sup>1</sup><https://ww2.arb.ca.gov/resources/documents/carb-2017-scoping-plan-identified-vmt-reductions-and-relationship-state-climate>

<sup>2</sup>[https://ww2.arb.ca.gov/sites/default/files/2019-01/2017\\_sp\\_vmt\\_reductions\\_jan19.pdf](https://ww2.arb.ca.gov/sites/default/files/2019-01/2017_sp_vmt_reductions_jan19.pdf)

<sup>3</sup> <https://www.climateactioncampaign.org/wp-content/uploads/2018/02/CAP-Report-Card-2nd-Edition.pdf>

- Adequately plan to meet the housing needs of everyone in the community (California)<sup>5</sup>
- SB 743 VMT reduction goals

Meeting these goals is not only reasonable, but also urgently required if we are going to solve some of the unrelenting challenges faced by residents of San Diego. Indeed, SANDAG’s prior RTP was found to be deficient for failing to discuss an alternative which could significantly reduce total vehicle miles traveled (“VMT”) (*Cleveland National Forest Foundation v. San Diego Association of Governments*. (17 Cal.App. 5th 413, 435-437 (2017))). Heretofore, the San Diego region has met these challenges with clever words, not deeds. These goals are achievable *only* if land use and transportation are addressed together.

These synergies are recognized in SANDAG’s *Urban Area Transit Strategy* and the City of San Diego’s *General Plan Housing Element* which includes this goal:

*Ensure the provision of sufficient housing for all income groups to accommodate San Diego’s anticipated share of regional growth ...in a manner consistent with the development pattern of the Sustainable Communities Strategy (SCS), that will help meet regional GHG targets by improving transportation and land use coordination and jobs/housing balance, creating more transit-oriented, compact and walkable communities, providing more housing capacity for all income levels, and protecting resource areas.*<sup>6</sup>

The Climate, Housing, Transit Alternative would pick up where SANDAG’s Urban Area Transit Strategy left off in 2011.

### Housing + Transportation Affordability (H+T)

There is a huge amount of attention on housing affordability but too little focus on housing and transportation (“H+T”) affordability. Outlying housing may be cheaper in the short run than housing in the region’s core because of supply and demand – but any savings often are eaten up by increased transportation costs. Dispersed housing requires more cars per household and more VMT and GHG emissions per household.

The Center for Neighborhood Technologies has modeled H+T costs relative to income for the entire U.S. with support of the U.S. Department of Housing and Urban Development. Figure 1 shows the H+T affordability results for the San Diego region for households with the regional typical household income of \$64,309.

<sup>5</sup><http://www.hcd.ca.gov/community-development/housing-element/index.shtml>

<sup>6</sup><https://www.sandiego.gov/sites/default/files/legacy//planning/genplan/heu/pdf/housingelementfull.pdf>

Figure 1: H+T Costs as a Percent of Income<sup>7</sup>

Average Housing + Transportation Costs % Income

Factoring in both housing *and* transportation costs provides a more comprehensive way of thinking about the cost of housing and true affordability.

Transportation Costs

In dispersed areas, people need to own more vehicles and rely upon driving them farther distances which also drives up the cost of living.

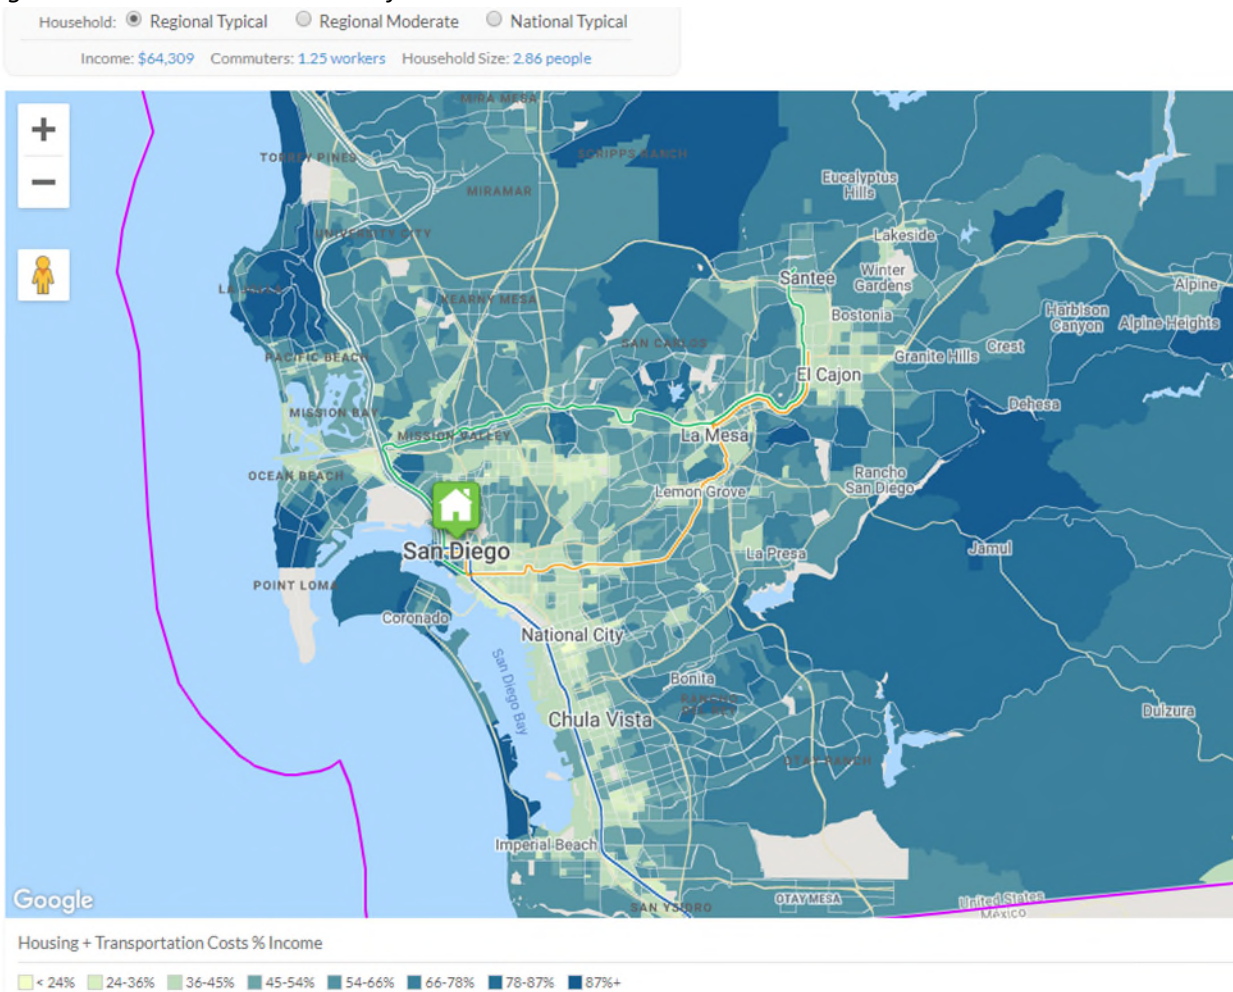

Figure 1 shows that, on average, transportation costs are about two-thirds as large as housing costs. However, transportation costs vary greatly across the region. Figure 2 maps H+T affordability.

Figure 2: H+T Costs as a Percent of Income<sup>8</sup>

<sup>7</sup> Center for Neighborhood Technologies. <https://htaindex.cnt.org/fact-sheets/?focus=cbsa&gid=42>

<sup>8</sup> Center for Neighborhood Technologies. <https://htaindex.cnt.org/>

As shown in Figure 2, when both housing and transportation costs are considered, the most affordable areas are in the light-colored areas primarily in the region's core and along major transit corridors. The housing affordability problem cannot be solved by building new housing in the darker-colored areas because high transportation costs make those areas inherently unaffordable. The areas in the more remote locations in San Diego County (i.e., even further from the City center) are not shown in order to make the map more readable, but these areas also tend to be more unaffordable when taking into account H+T.<sup>9</sup>

Real estate developers and their allies are currently pressuring San Diego County to retain its unlawful and inaccurate thresholds for assessing VMT impacts under SB 743, claiming that mitigation for VMT impacts will make housing in more remote parts of the County unaffordable. But housing in these areas is already unaffordable when transportation costs—that is, costs of driving long distances from locations not served by transit—are taken into account. SANDAG can help facilitate a better approach through the RTP, one that encourages the County to plan for housing in areas where transportation costs are low rather than allowing developers to build in remote areas and then trying to “mitigate” for the resulting VMT.

**The answer to housing affordability is H+T affordability. It is building more housing in the H+T affordable light-colored areas and in expanding the supply of H+T affordable areas through increased transit service.**

---

<sup>9</sup>Transportation costs—both in absolute terms and as a percentage of income—are even higher in many North County and East County communities (for example, transportation costs alone range from 25% of income in Alpine and Fallbrook to 27% of income in Borrego Springs and 28% of income in Julian and Pala). See <https://htaindex.cnt.org/fact-sheets/>.

As shown in Figure 3, the San Diego region currently scores extremely low on location efficient neighborhoods which are defined as “compact, close to jobs and services, with a variety of transportation choices.”

Figure 3: Location Efficiency Metrics for the San Diego Region<sup>10</sup>

### Location Efficiency Metrics

Places that are compact, close to jobs and services, with a variety of transportation choices, allow people to spend less time, energy, and money on transportation.

### Neighborhood Characteristic Scores (1-10)

As compared to neighborhoods in all 955 U.S. regions in the Index

Increasing this score will require more housing and jobs in areas served by transit today. It will also require a significant expansion of transit infrastructure and a substantial increase in service. The State of California, SANDAG and the County’s municipalities are working towards increasing the supply of housing in location efficient neighborhoods, but more can and should be done.

The Regional Housing Needs Allocation (“RHNA”) Determination, provided by the California Department of Housing and Community Development (“HCD”) in July 2018, requires the San Diego region to plan for 171,685 housing units in the 6th Housing Element Cycle (2021-2029). This 6<sup>th</sup> Element Cycle gives significant weight to transit availability. As shown in Figure 4, the 6<sup>th</sup> Element Cycle makes a substantial shift relative to the previous 5<sup>th</sup> Element Cycle away from the unincorporated areas and into the cities served by transit including San Diego, Escondido, La Mesa, and National City.

<sup>10</sup> Center for Neighborhood Technologies. <https://htaindex.cnt.org/fact-sheets/?focus=cbsa&gid=42>

Figure 4: RHNA Allocations 2020-2029 and 2010-2019<sup>11</sup>

The City of San Diego’s share of the total has risen from 54% of the total in the previous cycle to 63% in the new cycle. The City has ample capacity for this housing. It has identified capacity to construct 164,142 housing units or 56,241 more than required.<sup>12</sup> A large percentage of this capacity is in transit corridors.

These are positive changes. However, in the past, the housing allocations have been aspirational but not enforced. The State has signaled that it plans to be more aggressive about enforcement during this cycle. SANDAG can help the municipalities achieve their housing goals by shifting all transportation spending towards transit and non-motorized (walk and bike) infrastructure. These investments, which will facilitate getting people out of the cars, will also help the region increase density without large impacts on neighborhoods.

In addition to personal savings on car ownership (e.g., acquisition, registration, and insurance) and costs associated with driving (e.g., gasoline, replacement parts, and repairs), municipalities are beginning to recognize that neighborhoods served by transit require fewer parking spaces. Last year, the City of San Diego passed a parking reform package that eliminated parking requirements for sites located within

<sup>11</sup> Center for Neighborhood Technologies. <https://htaindex.cnt.org/>

<sup>12</sup> City of San Diego General Plan Housing Element 2021-2029 (March 2020 Draft), p. HE-38.

1/2-mile of a transit stop. This is a tremendously important reform for housing affordability because construction of parking can cost as much as \$90,000 per space in structures.<sup>13</sup>

Building a **Real**Regional Transit System - the Climate, Housing, Transit Alternative  
 SANDAG’s Executive Director Hasan Ikhata said:

***I don’t buy the debate that transit doesn’t work. Transit doesn’t work now because it’s not designed to work. You know, if you come from the border to downtown and it takes you, you know... it’s about 20 some miles... it takes you an hour in transit, that’s not real transit, as far as I’m concerned.***<sup>14</sup>

The San Diego region’s transit system performs much more poorly than its west coast peers. As shown in Figure 5, a much smaller share of the region’s workers commute by transit than other west coast regions.

Figure 5: Transit Work Mode Share in Four West Coast Regions

Source: U.S. Census American Community Survey

<sup>13</sup><https://timesofsandiego.com/politics/2019/03/04/san-diego-city-council-votes-to-repeal-minimum-parking-requirements-for-new-housing/>

<sup>14</sup>San Diego Tribune, February 27, 2019. <https://www.sandiegouniontribune.com/opinion/commentary/sd-utbg-sandag-ikhata-transit-interview-20190227-story.html>

Those who do commute by transit in the San Diego region suffer an enormous travel time penalty relative to the other large regions in California (Figure 6).

Figure 6: Ratio of Average Transit Commute Time to Average Auto Commute Time

Source: California Household Travel Survey

Improving the regional transit system is not a new idea in the San Diego region; there just has not been enough follow through. Almost a decade ago, SANDAG prepared the *Urban Area Transit Strategy* (“UATS”) as part of its 2011 RTP to connect regional housing needs with transit infrastructure:

*The overarching goal of the UATS was to create a world-class transit system for the San Diego region in 2050, with the aim of significantly increasing the attractiveness of transit, walking, and biking in the most urbanized areas of the region.*

*The vision called for a network of fast, flexible, reliable, safe, and convenient transit services that connect our homes to the region’s major employment centers and destinations. Achievement of this vision would make transit a more appealing option for many trips, reducing the impact of vehicular travel on the environment and on public health. Other key goals included:*

- *Making transit more time-competitive with automobile travel;*
- *Maximizing the role of transit within the broader transportation system; and*
- *Reducing vehicle miles traveled and greenhouse gas emissions in the region.* (p. TA 7-5)<sup>15</sup>

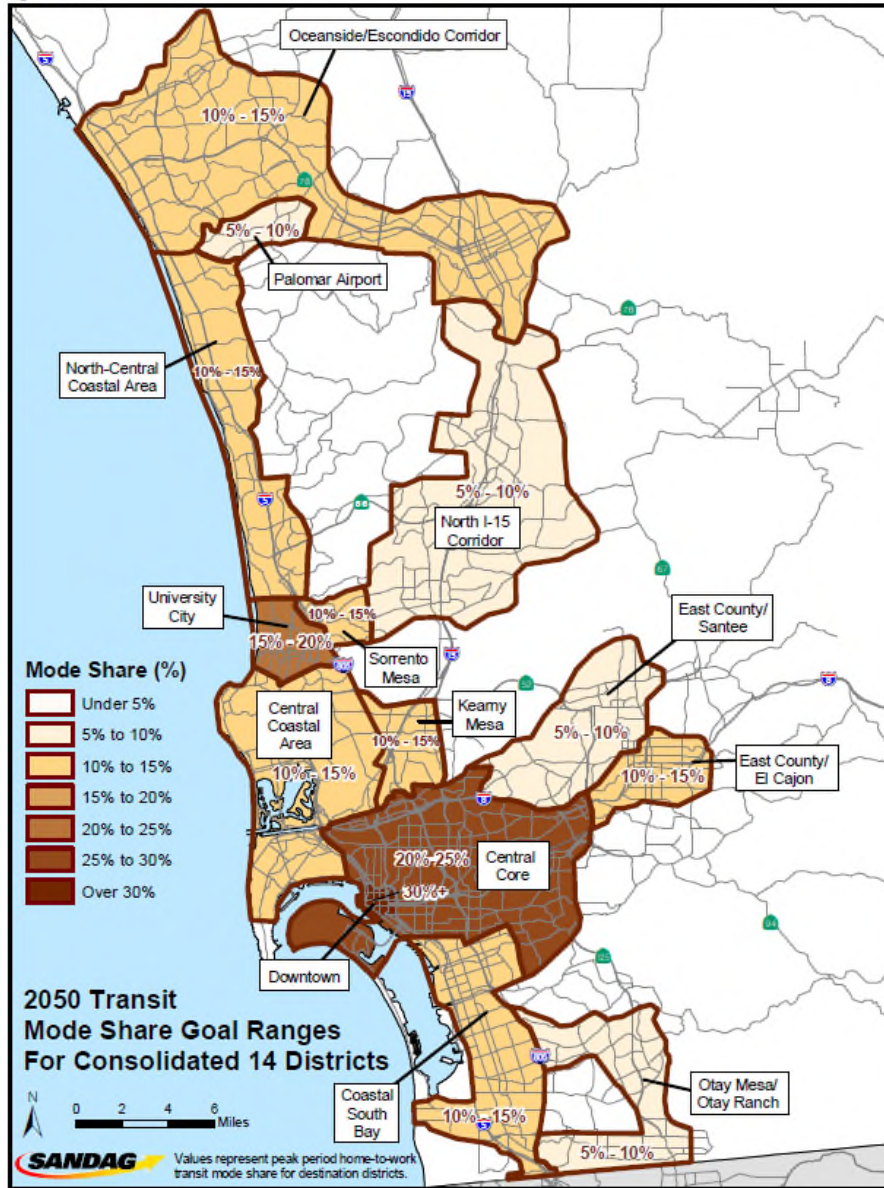

<sup>15</sup> SANDAG. Urban Area Transit Study.

<http://www.sandag.org/index.asp?projectid=368&fuseaction=projects.detail>

The UATS showed a high potential for transit ridership in the region's urban core (Figure 7).

Figure 7: SANDAG Urban Area Transit Study Figure TA 7.8

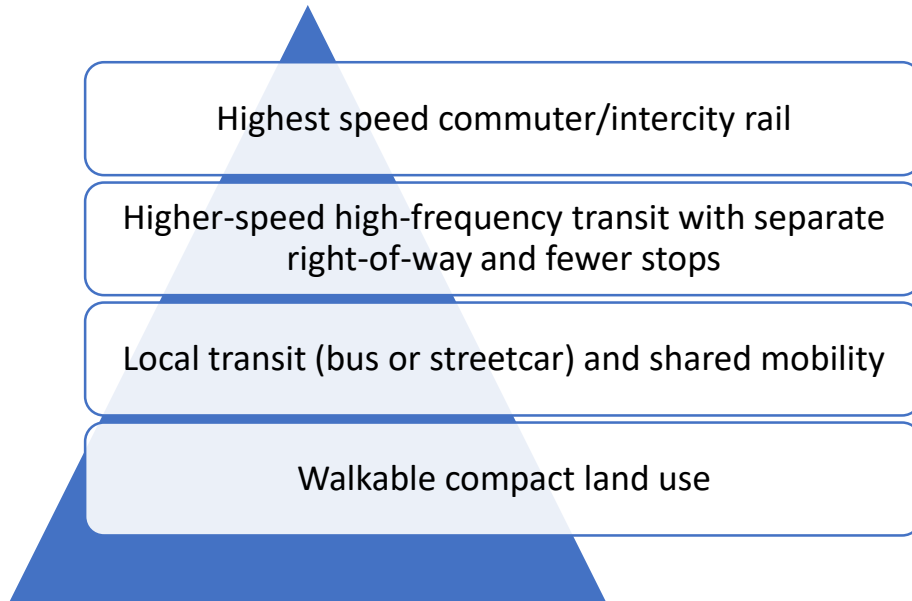

Figure TA 7.8

For transit to become time-competitive with the automobile, the Climate, Housing, Transit Alternative will require much more than a few isolated projects. It will require comprehensive investments at each of the four levels shown in Figure 8.

Figure 8: Complete Transit System

At the top level, improving rail service in the Los Angeles to San Diego (“LOSSAN”) corridor is a top priority. To this end, an important study by Caltrans and CNFF has just been completed regarding the potential transit ridership on the LOSSAN rail corridor between San Diego and Los Angeles. This study arose as a result of litigation filed by CNFF challenging the planned expansion of the I-5 freeway between La Jolla and Oceanside as inconsistent with California’s GHG emission targets. CNFF and Caltrans reached a settlement that focused on the potential to improve rail service on the LOSSAN corridor. In particular, the parties agreed to study the feasibility of constructing a double-track rail tunnel through Miramar Hill to facilitate transit on the corridor. The parties believed that the Miramar tunnel could reduce travel times and provide improved connections to local transit services in the University Town Center (UTC) area.

The recently-completed study concludes that the Miramar tunnel and rail line straightening would add a critical link to the LOSSAN rail corridor. *See Exhibit #1 (Miramar Tunnel Feasibility Study)*. Critically, it finds that the feasibility criteria for the Miramar tunnel have been satisfied. Its specific findings include the following:

1. The project would increase discretionary passengers by 1,300 to 1,700 per day, thereby reducing annual VMT 200 million to 240 million miles and GHG by 70,000 to 84,000 tons.
2. The project would provide competitive travel times, including a transit system average clock time that is approximately 3% faster than the automobile.
3. The project would be cost competitive, with transit riders cost at \$180/month versus automobile costs of \$507/month.
4. The project has no fatal engineering flaws.

The study further acknowledges a prior federal study that found construction of the Miramar tunnel along with other corridor improvements would reduce travel time between San Diego and Los Angeles to two hours. In short, construction of the new tunnel, which would provide enhanced access to downtown and the airport, would be a key transportation improvement for the region and the state. As the study notes, the LOSSAN rail corridor— together with the I-5 freeway – is the second-most traveled route in North America. The Miramar tunnel must be considered a key component of the Climate, Housing, Transit Alternative.

At the next level is a network of higher-speed, high frequency transit lines with separate rights of way and fewer stops. In many regions, a light rail service fills this niche, but in the San Diego region the Trolley has not filled this niche well. It operates too slowly and service is not frequent enough. Improvements are needed in both these dimensions. Achieving the required level of service in this higher-speed tier will require a rethinking of the system. As part of the Climate, Housing, Transit Alternative, SANDAG should evaluate speeding up the existing lines through grade separations and eliminating stops, as well as creating new higher-speed lines.

Express buses on managed lanes currently do not serve this higher-speed niche well because they connect freeway interchanges instead of land uses. A typical trip using these express buses will be unattractive because it also will involve connecting bus service on one or more circuitous routes. Express buses and managed lanes can work well for some park-and-ride travelers traveling to major destinations but cannot serve a significant portion of the region’s population well.

Both the regional rail and higher-speed high-frequency tiers need to be well connected. The Climate, Housing, Transit Alternative must include an inter-modal terminal (Grand Central) connecting San Diego’s urban core, the Airport, the LOSSAN corridor, the Sprinter corridor, and the Trolley system.

The Climate, Housing, Transit Alternative must also include efficient connections with frequent local buses (which could possibly be automated in the future). To this end, SANDAG must grapple with the first mile/last mile issue as this reflects a failure in land use and the existing transit system. While higher income travelers may have a choice of Uber-type services to solve this problem, this should not be viewed as a remedy for the average traveler.

Finally, the goal of a functional transit system is to serve an area-complete bike and walkable land use because no trip begins or ends on a transit vehicle. Most transit trips begin and end with a walk trip. In regions with high transit use, there are generally about twice as many walk trips as transit trips. Investments in walk and bike infrastructure should be a top priority. Consistent with the City’s Climate Action Plan, the Climate, Housing, Transit Alternative must model a 50% transit, walk and bike mode share for residents in the central core.

### Stop Expanding Freeways

Building a real regional transit network will require all the region’s transportation investment dollars for the foreseeable future. **The Climate, Housing, Transit Alternative must not include any freeway expansion.**

The billions of dollars spent on freeway expansion the past 20 years have A) failed to reduce congestion, B) caused a substantial increase in VMT and GHG emissions, and C) resulted in a severe housing shortage. The transportation models used to justify these freeway expansion projects have been wrong

on all counts. These models - both in the San Diego region and in regions throughout the U.S. – forecast dire increases in travel time if freeways are not widened, and substantial increases in travel time even if they are widened. In fact, as shown in Figure 9, travel time has stayed remarkably constant in the U.S. for decades.

Figure 9: Average Time Driving (minutes per day) 1990-2017 by MSA Population (NHTS)

Source: National Household Travel Survey.

Figure 9 shows the “average time spent driving a private vehicle in a typical day.” There was an increase during the 1990s, a time when many women were joining the labor force, but since 2000 there has been little change. Time spent driving also is very similar across differently sized regions. There is evidence that people have a “travel time budget”. If travel speeds drop, they (on average) will adapt to travel a shorter distance.

In contrast, if travel speeds increase, people (on average) will travel longer distances. This phenomenon is known as “induced travel”. In work for the California Air Resources Board (“CARB”), researchers at the University of California and the University of Southern California reviewed the literature on induced travel and concluded:

*Thus, the best estimate for the long-run effect of highway capacity on VMT is an elasticity close to 1.0, implying that in congested metropolitan areas, adding new*

*capacity to the existing system of limited-access highways is unlikely to reduce congestion or associated GHG in the long-run.*<sup>16</sup>

The SANDAG regional transportation model fails to account properly for induced travel although there now are newer algorithms that could address this deficiency.<sup>17</sup>

Senate Bill 743 establishes VMT as the appropriate metric for determining the impacts of transportation projects. This has made properly accounting for induced VMT critical in the regulatory process. The Office of Planning and Research's ("OPR") *Technical Advisory on Evaluating Transportation Impacts in CEQA* recommends:

*Whenever employing a travel demand model to assess induced vehicle travel, any limitation or known lack of sensitivity in the analysis that might cause substantial errors in the VMT estimate (for example, model insensitivity to one of the components of induced VMT described above) should be disclosed and characterized, and a description should be provided on how it could influence the analysis results. A discussion of the potential error or bias should be carried into analyses that rely on the VMT analysis, such as greenhouse gas emissions, air quality, energy, and noise.*<sup>18</sup>

The National Center for Sustainable Transportation at the University of California at Davis has produced an *Induced Travel Calculator*<sup>19</sup> to help address the deficiencies in the models. Recently, Caltrans also has issued new draft guidance on accounting for induced travel. It recommends following the OPR recommendations:

*Caltrans recommends using the VMT analysis approaches recommended in OPR's advisory when evaluating the transportation impacts of projects on the State Highway System (SHS).*<sup>20</sup>

Neither expanding freeways nor not expanding freeways will have any effect on regional congestion or average travel times. However, expanding freeways will cause significant increases in VMT and GHG emissions, and will continue to starve the transit system of needed investments.

## A Completely New Direction is Needed

Given that transit in the San Diego region has been and continues to be severely under-funded and under-built compared to roadway projects, as discussed above, the Climate, Housing, Transit Alternative must exclude roadway/freeway funding and expansion. Heretofore, SANDAG's planning has arbitrarily segmented freeway and transit projects. This artificial segmentation is not only irrational, it is fatal in achieving sustainable housing goals because **transit, bike, and walk mobility and auto-based mobility serve contradictory land use purposes**. SANDAG's failure to historically recognize this fundamental truth is the Achilles heel of its planning and lies at the doorstep of the agency's on-going inability to deliver a plan that truly unites our community on an ecologically sustainable foundation.

It is abundantly clear that SANDAG's past planning efforts have not only been deficient but have repeatedly failed to heed the ominous warnings from the courts, the public, and the planet itself. With California literally on fire due largely to climate change induced drought and high temperatures, SANDAG has failed the public by not aggressively pursuing a transportation scenario that would meet the State's GHG and VMT reduction goals.<sup>21</sup> The Climate, Housing, Transportation Alternative would help achieve targets set in legislation, the California Air Resources Board's Climate Change Scoping Plan, and relevant Executive Orders.

Similarly, with regard to the local housing crisis, it is inconceivable that SANDAG's prior RTPs have not called for a 50% transit, bike, and walk mode share alternative necessary to activate infill housing, especially since the urban core is already zoned for such housing. Here too, the Climate, Housing, Transit Alternative would facilitate this infill housing and help the City of San Diego achieve the targets set forth in its Climate Action Plan.

Additionally, the County's continued business-as-usual approach to planning makes the need for SANDAG to strengthen guidance regarding future development in the region all the more pressing. In spite of all the talk of a new direction, the County recently unveiled a plan update for the forest community of Alpine which can only be described as a VMT and ecosystem catastrophe. This planning contradiction was noted in Shute Mihaly's comment letter on the Alpine plan<sup>22</sup>. The tectonic shift in regional transit mobility mentioned in the opening paragraph of this letter must become a reality soon to avoid irreversible damage to our wild lands and a missed opportunity for the region.

Faced with these pressing social and environmental challenges, SANDAG's new regional direction can be strengthened by following established judicial, executive, and local legislative guidelines designed to meet the housing and climate crises. The public urgently deserves to see what it would take for the region to build a world-class transit system and to develop reasonably priced infill housing. Common sense dictates that the Climate, Housing, Transit Alternative would necessarily begin with a complete, first phase transit, bike, and walk system with an inter-modal terminal connecting the Airport, the Central Core, the LOSSAN Corridor, the Sprinter corridor, and the Trolley system. It is important to note that the Climate, Housing, Transit Alternative would not only be the "environmentally superior alternative", it would also be the socio-economic superior alternative because a true transit, bike and walk system reduces both the cost and shortage of housing and the cost of driving.

---

<sup>21</sup> <https://abcnews.go.com/Politics/climate-change-make-wildfires-spread-factor/story?id=56937704>

<sup>22</sup> <https://drive.google.com/file/d/1Nt6sc7weFGbHCNIHsNOiMFCiQKjCvFP/view>

In conclusion, in the face of a severe, entrenched housing crisis endangering the public welfare and the severe climate crisis endangering the planet, SANDAG owes the public nothing less than a transit alternative that immediately meets these life threatening challenges rather than artificially prolonging them.

San Diego, CA 92101

**RE: Climate Action Campaign Comments, SANDAG's Draft 2021 Regional Plan**

Climate Action Campaign is a climate and environmental nonprofit organization based in San Diego and Orange County with a simple mission: stop the climate crisis through effective policy action.

We thank SANDAG staff and Board for their work on the draft 2021 Regional Plan, and are encouraged by the agency's bold new direction to start the process of transforming the San Diego region's transportation system so it is more sustainable and equitable.

Please see below for our comments to strengthen the draft plan to secure a transportation future that is climate-safe and climate-just:

***Putting the Region on the Path to Zero Carbon***

The most up to date climate science, including the landmark 2018 UN IPCC Special Report on Global Warming, says that we must eliminate greenhouse gas emissions by mid-century to stave off the most devastating impacts of the climate crisis, such as wildfires, extreme heat, drought, flooding, and more.<sup>1</sup>

California's strongest climate goal, Executive Order B-55-18, calls for carbon neutrality as soon as possible, and no later than 2045.<sup>2</sup> Meanwhile, CARB's mandated emissions reduction target for SANDAG, per SB 375, is a 19% reduction of per capita greenhouse gas emissions from cars and light duty trucks below 2005 levels by 2035. Page 13 of Chapter 1 states that the 2021 Regional Plan will achieve a 20% reduction, exceeding the MPO's state mandate.

Transportation accounts for nearly half of the region's emissions. To remain on track to achieve carbon neutrality, as climate science says is necessary, SANDAG must go further in exceeding CARB's target. We believe a reduction from transportation by at least 30% by 2035 is achievable and needed to ensure a climate-safe Zero Carbon future, and urge SANDAG to map out the strategies needed to achieve that target.

---

<sup>1</sup><https://www.ipcc.ch/sr15/>

<sup>2</sup><https://www.ca.gov/archive/gov39/wp-content/uploads/2018/09/9.10.18-Executive-Order.pdf>

## ***Youth Opportunity Passes: No-Cost Transit for Youth 24 and Under***

Page A-51 of Appendix A proposes “subsidies to reduce the fares paid by transit riders.” Appendix A should be amended to include an explicit commitment to Youth Opportunity Passes (YOP)—no-cost transit passes for youth 24 and under—and should be implemented immediately following the adoption of the 2021 Regional Plan. SANDAG should also commit to overseeing YOP in partnership with MTS and NCTD, to ensure successful implementation by the local transit operating agencies.

Community based organizations have been fighting for YOP for nearly a decade, as it is an essential investment in our region’s youth, providing access to education and early career opportunities, while fostering the next generation of sustainable transportation riders.<sup>3</sup> We urge you to make YOP a top priority in the 2021 Regional Plan.

## ***Mode Shift Projections in Transit Priority Areas***

Attachment 6 of Appendix T (Network Development and Performance), includes the “Performance Measure Results Tables.” Page T6-6 includes mode share projections for the 2021 Regional Plan for the benchmark years 2025, 2035, and 2050 for peak period work trips, all day work trips, and all trips.<sup>4</sup>

We request this same set of projections, but specifically for Transit Priority Areas, to be able to compare Climate Action Plan’s mode shift targets with the mode shift that will be achieved through the buildout of the plan.

For example, the City of San Diego’s Climate Action Plan (CAP) set ambitious targets for the percentage of commuters travelling by bike, walk, and transit in Transit Priority Areas (18% by bike, 7% by walk, and 25% by transit by 2035)<sup>5</sup>, and we want to ensure our regional transportation goals and local transportation targets are meaningfully aligned.

## ***Expedite Transit Leap Timelines, Prioritizing Investments in Communities of Concern***

To maximize mode shift away from fossil fuel cars and towards bike, walk, and transit, Transit Leap timelines must be expedited, and prioritized in the early years of the plan over Managed Lanes and Managed Lane Connector, which will yield an increase in vehicle miles travelled.

Investments in commuter rail, light rail, and bus rapid transit infrastructure should be prioritized in Communities of Concern, to increase access to sustainable mobility options and connections to the region’s job centers. The climate crisis and environmental injustice have and will impact Communities of Concern first and worst. Historically underinvested communities are exposed to

---

<sup>3</sup><https://www.midcitycan.org/aboutyop>

<sup>4</sup>[https://sdforward.com/docs/default-source/2021-regional-plan/appendix-t---network-development-and-performance.pdf?sfvrsn=6243fd65\\_2](https://sdforward.com/docs/default-source/2021-regional-plan/appendix-t---network-development-and-performance.pdf?sfvrsn=6243fd65_2)

<sup>5</sup>[https://www.sandiego.gov/sites/default/files/final\\_july\\_2016\\_cap.pdf](https://www.sandiego.gov/sites/default/files/final_july_2016_cap.pdf)

the region's most dangerously polluted air from cars and trucks, and are left with disconnected transit trips or long, expensive car commutes. As such, we support the inclusion of "Social Equity Early Action Transit Pilots" as a mechanism to streamline immediate investments in the communities on the frontlines of these crises.

### ***Expedite Completion of the Del Mar Tunnel***

Page A-26 of Appendix A states that the Del Mar tunnel will be complete by 2035. Currently, the 1.6 mile stretch of LOSSAN tracks in Del Mar is located dangerously close to the edge of the bluffs, and several bluff failures within feet of the tracks have occurred over the past 2 years alone.

With the bluffs eroding at approximately 6 inches per year, and the ever-intensifying threat of sea-level rise due to the climate crisis, these incredibly dangerous bluff failures will only increase in severity and frequency, putting lives seriously at risk.

Moving the tracks off the bluffs is essential to securing a long-term solution for the LOSSAN corridor, while preventing increased air pollution from shipping trucks, and ensuring economic prosperity for the region. To secure a climate-safe transportation system, we urge you to make the Del Mar tunnel a top priority, and urge for completion as soon as possible, no later than 2025-2030.

### ***Conclusion***

Thank you for the opportunity to provide comment on this critically important document. The 2021 Regional Plan is a key opportunity for climate action, justice and equity for Communities of Concern, and good union jobs. We look forward to continued engagement with SANDAG on the plan this year.

Sincerely,

Noah Harris

## **REQUEST FOR COMMENTS ON THE DRAFT 2021 REGIONAL PLAN FOR THE SAN DIEGO ASSOCIATION OF GOVERNMENTS (SANDAG)**

Dear Mr. <sup>Hasan</sup>Ikhata,

Thank you to the San Diego Association of Governments (SANDAG) for your efforts to create a Regional Comprehensive Plan and Sustainable Communities Strategy (Regional Plan) to help design a regional transportation system that is fast, fair, clean and reduces greenhouse gas emissions. As County staff, we are committed to working with SANDAG staff on our shared goals of implementing programs and services to improve the quality of life of our residents as we determine where and how we grow, connect people and places, protect the environment, and provide opportunity for all of our region's residents.

This comment letter outlines areas within the Regional Plan for which County staff would like to request further clarification, exploration, and consideration. Attachment A provides additional comments from County staff for your consideration and incorporates additional information related to County-specific plans or policies that may further inform the Regional Plan.

### **LAND USE, TRANSPORTATION PLANNING, AND SMART GROWTH**

Land use and transportation planning in the San Diego region is evolving to better address the most pressing issues of today, including climate change, quality of life, attainable housing, and social and economic inequities. The County has several planning efforts underway which prioritize addressing these issues, including the Regional Decarbonization Framework, the Climate Action Plan Update, the Electric Vehicle Roadmap, Office of Environmental and Climate Justice, and establishment of VMT thresholds. While independent of the Regional Plan, these efforts are aligned with the goals of the Regional Plan. County staff is interested in further understanding the regional growth modeling assumptions used within the Regional Plan and alignment with these County efforts.

## **PLANNING FOR THE UNINCORPORATED AREAS**

The County represents more than 500,000 residents who live within 34 unincorporated communities throughout the region. County staff would like to better understand how the Regional Plan will address transportation options outside of proposed mobility hubs for those communities. The unincorporated community of Ramona, for example, has a population of 36,000 residents, which is a larger population than the incorporated communities of Imperial Beach, Lemon Grove, Coronado, Solana Beach, and Del Mar.

Less than 1% of the unincorporated area is within the proposed mobility hubs, which is where transit and on-demand travel infrastructure investment will be focused. The unincorporated north and east county communities represent a significant population with higher-than-average VMT in the region. Investment in public transit and other transportation options will make it easier for people to drive less, which results in decreased GHG emissions. However, investment outside of mobility hubs appears to be limited, which would make it difficult for unincorporated residents to use new transit service.

To promote greater equity, County staff see opportunities to expand the proposed mobility hubs to include adjacent unincorporated communities. When we overlay the proposed mobility hubs with the County's VMT efficient areas (using both the unincorporated and regional averages), North County Metro, Lakeside, and Spring Valley (Attachment B) are adjacent to what appear to be proposed mobility hubs. These unincorporated communities would benefit from additional access and investment associated with inclusion in adjacent mobility hubs, as these communities have few existing alternative options to driving.

County staff is also interested in understanding how Regional Housing Needs Assessment (RHNA) allocations would be assigned. For the current 6<sup>th</sup> RHNA cycle, which covers 2021 – 2029, SANDAG allocated 6,700 units for the unincorporated area, with a total housing forecast in the Regional Plan of 7,419 units through 2050 for the unincorporated area. This forecast projects the County's RHNA allocation of 6,700 units being met by 2029, with an additional growth of 719 units by 2035, and projects no further growth in the unincorporated area through 2050. Based on this forecast, it appears that beyond 2035, all future housing needs in the region from RHNA cycles would be allocated to and met by growth in incorporated cities.

In order to fulfill the goals of the Regional Plan in providing access to affordable, reliable, and safe mobility options for everyone in the region, County staff would like to work with SANDAG to ensure consideration is given to future investments and incentives within the unincorporated area that would result in expanded options for transit and active transportation, and to encourage shorter and fewer automobile trips, including locations of mobility hubs, transit leap, flexible fleets, and complete corridors.

## **COMMUTER PATTERNS AND MOBILITY IN THE UNINCORPORATED AREA**

The Regional Plan focuses on five key investment opportunities: Next Operating System (OS), Complete Corridors, Transit Leap, Mobility Hubs, and Flexible Fleets. Many of the Regional Plan investments would be contained within proposed mobility hubs and along identified complete corridors. The majority of infrastructure improvements appear to support a shift to new rail and trolley line infrastructure, largely along the coastal areas. However, Ramona, Lakeside, Spring Valley, and other unincorporated east and north county communities represent a significant population that would benefit from similar consideration for infrastructure improvements as that proposed for the coastal communities with less population. According to SANDAG's "Commuting Patterns in the San Diego Region" study, a majority of the unincorporated east and north county residents who are employed commute outside the boundaries of their County Supervisorial

district, with 84% of District 2 residents working outside the district and 82% of District 5 residents working outside the district. Vehicle miles traveled could be reduced through greater mobility options for the unincorporated area (i.e., expansion of mobility hubs, increased transit options such as bus rapid transit, and improvements to transit frequency and service areas).

The County worked closely with SANDAG as part of the 2015 Regional Plan to identify roads in the unincorporated areas to include in the Regional Arterial System (RAS). Many of these roads serve as evacuation routes during emergencies, provide access to unincorporated communities from Caltrans roads, and create a link to the larger San Diego region.

County staff would like to continue coordinating with SANDAG to further identify Regional Plan investments in infrastructure, technology, and communication improvements for roads identified in both the County's Mobility Element and unincorporated roads included in the RAS and how these investments will further connect the unincorporated area to proposed mobility hubs, flexible fleets, or transit leaps. In addition to providing efficient movement of people and goods, these investments would increase the efficiency of evacuation routes, relay important information on evacuation conditions to first responders, and assist in getting residents safely away from hazardous conditions, all important components of resiliency planning.

#### **FUNDING AND FINANCING**

County staff appreciates the difficulty in forecasting funding and revenue sources for a regional transportation network. The Regional Plan identifies use of TransNet funds as part of the implementation, but it is not clear whether projects that have previously been planned, programmed, or awarded as part of the previous plan using TransNet would retain that funding allocation, or if there would be a reallocation of these funds as part of the Regional Plan. It is also unclear if there would be any changes to the current allocation or use of funds that local agencies receive directly for local road system improvements. The unincorporated area relies on TransNet funding to build, improve, and maintain transportation facilities that enhance roadway safety and support smart growth development, including road infrastructure to support increased transit options. Loss or reallocation of this funding could affect these projects and limit the County's ability to provide transportation services in support of our goal of reducing greenhouse gas emissions.

The Regional Plan indicates that user fees would help build a transportation system that provides travelers with alternatives to driving. County staff would like to further discuss how the proposed road user charges would be developed, implemented, and applied to ensure that this funding strategy will not disproportionately burden unincorporated communities, which often have longer commutes and less access to alternative transportation options due to lack of regional planning for transit services to these communities. Revenues generated should also be allocated to support additional transportation and mobility options in unincorporated communities, while vehicle use by those with access to alternate modes of transportation should be disincentivized since their communities are receiving significant investments in public transit.

County staff looks forward to learning more about how future funding and investment would be applied to ensure that both the benefits and the costs of the Regional Plan are equitably distributed across the region.

#### **RESOURCE DISTRIBUTION**

The Regional Plan provides SANDAG with an opportunity to guide future investments in a way that meets smart growth objectives and reduces GHG emissions, but also guides future allocation of resources to achieve equitable outcomes. Several of the unincorporated communities, such as Lakeside, Spring Valley, and Ramona, have larger populations than some of the incorporated

cities that are prioritized in the Regional Plan. In review of the proposed plan expenditures, a majority of the capital investments (55% of RTP funding) appear to go toward mobility hubs, complete corridors, and Next OS investments that are primarily outside of unincorporated communities. It is unclear what proportion of investment would go toward addressing mobility challenges within unincorporated communities and infrastructure investment that would provide linkages between the unincorporated areas and the proposed mobility hubs, transit leap, flexible fleets, and complete corridors. County staff is committed to working with SANDAG to further identify opportunities to equitably distribute the mobility benefits of the 5 Big Moves and further reduce GHG emissions regionwide.

The County appreciates the opportunity to comment on the Draft Regional Plan, and staff looks forward to future discussions regarding these comments. If you have questions regarding this letter, please contact Rami Talleh, Deputy Director with the Department of Planning and Development Services at 858-495-5475 or [Rami.Talleh@sdcounty.ca.gov](mailto:Rami.Talleh@sdcounty.ca.gov).

## **ATTACHMENT A 2021 REGIONAL PLAN COMMENTS FROM COUNTY OF SAN DIEGO DEPARTMENTS AND DIVISIONS**

County of San Diego (County) staff in Planning & Development Services, the Department of Public Works, and the Department of Parks and Recreation reviewed the San Diego Association of Governments' (SANDAG) Draft 2021 Regional Plan (Regional Plan), for applicability to their respective work programs and County initiatives that are planned or currently underway. The County offers the following comments for your consideration.

### **TRANSPORTATION**

1. County staff would be interested to better understand and discuss further with SANDAG the potential for Regional Plan strategies to be used as part of a potential regional mitigation strategy related to Vehicle Miles Traveled (VMT).
2. When would funding be expected to be implemented related to Transit Leap/Flexible Fleet Connections to Mobility Hub areas, as this is a potential opportunity to reduce VMT for residents living in the unincorporated area?
3. The County has developed an Electric Vehicle (EV) Roadmap and is committed to assisting with the deployment of regionwide EV infrastructure to reduce GHG emissions in the transportation sector. Could SANDAG provide additional details on the future development, application, and implementation of the proposed Road User Fees and other proposed road usage revenues? Will consideration be given to exemptions for use of clean mobility strategies?
4. County staff would like to discuss with SANDAG staff the Regional Plan strategies, including funding for Major Transit (for purposes of CEQA, defined as a rail transit station, ferry terminal served by bus or rail, and a bus stop with two or more lines that provide transit service at 15 minute intervals or better during peak commute periods) in areas of the unincorporated area that are identified as "VMT efficient" in the SANDAG VMT Map.
5. There is significant investment in development and infrastructure in the Otay Mesa area, and Otay Mesa is identified as a "Mobility Hub" area in the RTP. County staff would like to better understand what funding has been identified for this "Mobility Hub" area.
6. County staff would like to discuss with SANDAG the potential for "Major Transit" services along the I-15 corridor, such as the potential for buses on shoulders.

## **ROADS/TRAFFIC/FIELD ENGINEERING**

7. Complete Corridors, such as the SR-67 and I-15 Corridors, are envisioned to act as the backbone of the regional transportation system. In addition to providing for safe and comfortable spaces to get around for all modes of transportation, road improvements such as intersection widening are important for the safe and reliable movement of all road users. County staff would like to discuss further identification and investment within complete corridors that provide linkages to the unincorporated area. These improvements could assist in providing routes for the County's eastern and northern rural regions that could be essential in the event of accidents or fire evacuation. For example, County staff would like to discuss with SANDAG the option of including safety improvements along the SR-67 Corridor on Wildcat Canyon Road, as this road is a relief route to SR-67. Additionally, road improvements on Old Hwy 395 and Pala Temecula Road in the north county may merit further conversation, as both of these roads serve as alternate routes to I-15 during peak traffic hours.
8. County staff would like to further discuss improvements of low flow crossings that are necessary to limit area flooding as well as the safe passage of motorists.
9. County staff would like to work with SANDAG to identify evacuation routes at a regional level, and the possibility of creating a separate section within the Regional Plan that would identify improvements of these routes and potential funding that could be part of the 2021 Regional Plan.
10. County staff would like to discuss with SANDAG how Smart Infrastructure and Connected Vehicles will address the legal and financial challenges with sharing traffic signal data with private entities and the liability of the potential misuse of signal timing data.
11. County staff would like to better understand the impact of Electric Vehicle Infrastructure on County of San Diego public right of way.

## **WATERSHED**

12. Stormwater Management & Regional Needs Assessment; suggested edits in Appendix R, page R-2:
  - a. "The County of San Diego has initiated an update of the 2010 Needs Assessment's 40-year water quality cost estimate using more recent water quality planning documents and strategies for achieving regulatory compliance and water quality objectives throughout the region. Since 2010, the Copermitees have worked to formulate Water Quality Improvement Plans (WQIPs) for the region's watersheds, including strategies, planned projects, and schedules to address their respective water quality objectives and compliance needs. The update to the Needs Assessment is intended to assist the County in planning and decision making and will draw upon the most recent WQIPs, with a focus on unincorporated areas to develop updated cost information."

## BIOLOGY

13. Figure AA.1 shows the conserved habitat lands in the San Diego region (light green) and displays the areas included in the four subregional habitat conservation plans (subfigure).
  - a. The Pre-Approved Mitigation Area (PAMA) of the South County Multiple Species Conservation Program (MSCP) and draft PAMA of the draft North County MSCP are labeled as “Proposed Conserved Habitat Lands” (dark green). This label may be misinterpreted by readers. While the MSCP Preserves will be assembled within the PAMA, not all PAMA designated lands will be conserved or are being actively pursued for conservation at this time.
  - b. The draft Focused Conservation Area (FCA) of the draft East County MSCP was not included in the “Proposed Conserved Habitat Lands” (dark green). This area is equivalent to the draft North County MSCP’s draft PAMA and should be included in this figure.
  - c. The Rancho Guejito property located north of San Pasqual Valley Road will not be included in future iterations of the draft North County MSCP Permit Area. The portions of this property identified within the draft North County MSCP should be changed from dark green to white to reflect this change.
  - d. In the subfigure, both the draft North County MSCP and Multiple Habitat Conservation Plan (MHCP) are identified by the number “4.” The MHCP area should be identified by the number “1” to correspond with the provided key.
  
14. Although the draft 2021 Regional Plan mentions the importance of protecting habitat corridors and wildlife linkages through land acquisition, it does not appear to include the construction of safe passageways to connect wildlife to preserved lands bisected by existing and future regional transit corridors. It is recommended that SANDAG work with the San Diego Monitoring and Management Program (SDMMP) and community partners to identify the areas along regional transit corridors that would benefit from wildlife crossings and that these improvements be included in future regional projects.

## PARKS AND RECREATION

15. For proposed projects that occur adjacent to Department of Parks and Recreation (DPR) County-managed lands, DPR staff would like to coordinate with SANDAG staff to ensure wildlife connectivity is maintained from adjacent lands to preserved County lands, including wildlife-only crossings.
  
16. For proposed projects that occur adjacent to or near existing or potential future trail connections, DPR staff would like to coordinate with SANDAG staff on trail connectivity throughout the County and incorporate safe multi-use crossings such as bridges or overpasses for recreational use.
  
17. DPR staff request SANDAG staff coordinate in developing SANDAG’s 5 Comprehensive Multimodal Corridor Plans as mentioned in Appendix B: Implementation near DPR facilities:
  - a. Central Mobility Hub and Connections, Coast, Canyons, and Trails – State Route 52, North County – SPRINTER/Palomar Airport Road/State Route 78/State Route 76, San Vicente – State Route 67, South Bay to Sorrento – Purple Line/Interstate 805/Blue Line/Interstate 5 South.

- b. Study additional seven corridors to inform the next Regional Continuing Actions.
- c. Pursue funding opportunities for projects, programs, and services identified in completed CMCPs.

18. County Staff would like to discuss with SANDAG the possibility of including trails and trail systems within the unincorporated area as part of the 2021 Regional Plan and to consider California Coastal Trail connections to DPR facilities.

## **AIRPORTS**

19. As the owner and operator for eight airports in the region, County Airports continues efforts to safely operate its facilities, ensure future land uses are compatible with aircraft operations, and protect the health and safety of people and property within the vicinity of an airport. The County's airports serve as transportation hubs, emergency service facilities and economic engines in their communities. McClellan-Palomar Airport is the only commercial airport in North County and has over 145,000 annual aircraft operations. It is also a Customs and Border Protection Port of Entry. In East County, Gillespie Field is the 44<sup>th</sup> busiest airport in the nation with 240,000 annual operations. Both of these airports support thousands of jobs and generate hundreds of millions of dollars in economic activity. The County looks forward to the integration of these airports into the regional transportation system.

20. The San Diego County Regional Airport Authority adopted Airport Land Use Compatibility Plans for the eight airports, which included land use compatibility policies related to airspace, noise, safety and overflight. Those policies have been adopted by the County of San Diego through its General Plan and Zoning Code. After evaluating the forecasted increases in housing and jobs around the Mobility Hubs, there are several land use assumptions related to safety and noise around Fallbrook Airpark, Jacumba Airport, Gillespie Field and McClellan-Palomar Airport that County staff would like to better understand. For example, there are forecasted incompatible housing increases within the Runway Protection Zones at Gillespie Field. These inconsistencies could result in the assumed intensities and densities increases being unachievable.

## **ATTACHMENT B 2021 REGIONAL PLAN PROPOSED MOBILITY HUB EXPANSION AREAS**

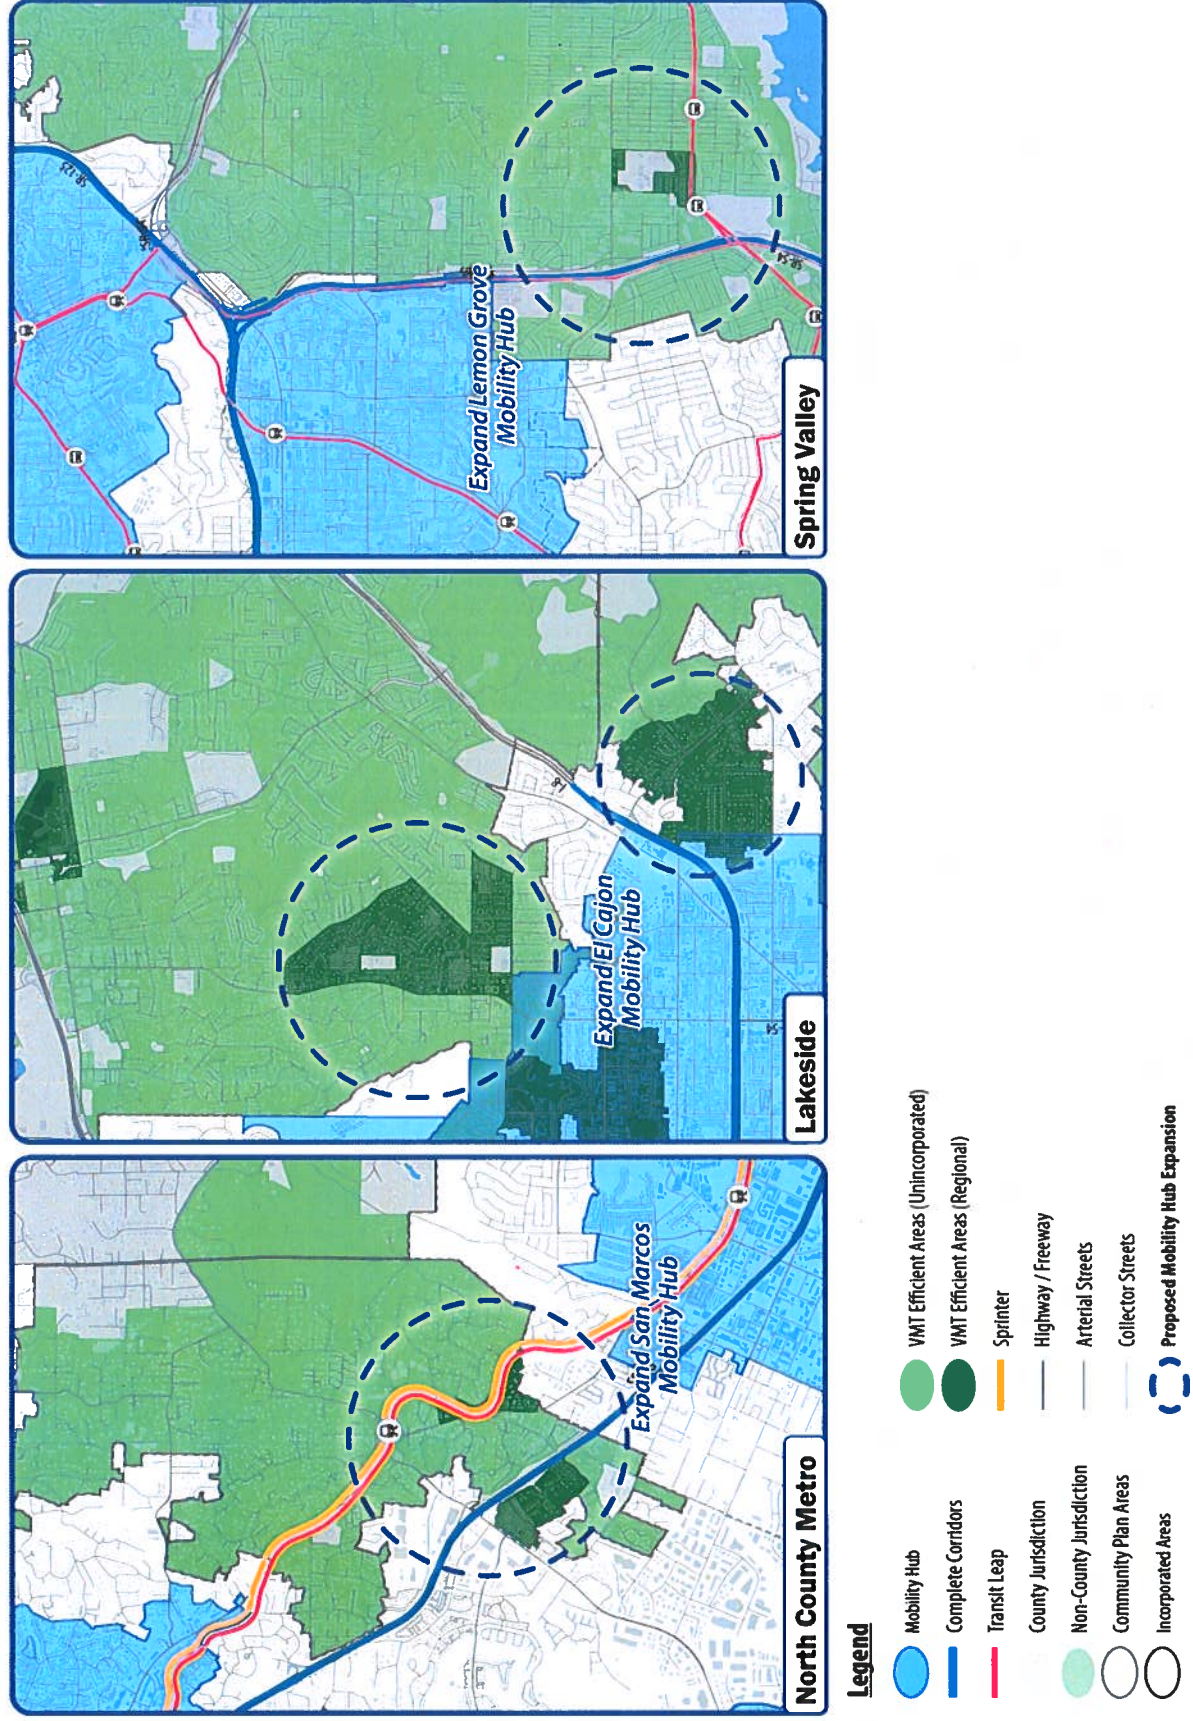

The Regional Plan will focus future investment, development, and growth in centralized areas referred to as “mobility hubs.” There are locations in the unincorporated area that the County has forecasted for future growth, which included already designated Regional Housing Needs Assessment (RHNA) sites, and are located within close proximity to a proposed mobility hub. The County would like to work with SANDAG to consider the expansion of proposed mobility hubs to include additional unincorporated north and east county communities. As indicated in Figure 1, these proposed expansions include areas in North County Metro, Lakeside, and Spring Valley. Additional details for these three mobility hub expansions are provided below.

The North County Metro community is located between the proposed Vista and San Marcos mobility hubs. Expansion of the San Marcos mobility hub could include the Buena Creek Sprinter Station and additional housing units, including multiple RHNA sites.

Lakeside has multiple areas that are identified as efficient areas compared to the regional vehicle miles traveled (VMT) average. These areas are located immediately adjacent to the proposed El Cajon mobility hub. Expansion of the El Cajon mobility hub could include these VMT efficient areas as well as potentially including additional growth areas in Lakeside along the I-8 corridor.

Spring Valley is located east of the proposed Lemon Grove mobility hub and south of the proposed La Mesa mobility hub. This community has existing transit access along Jamacha Boulevard and is in close proximity to the MTS Trolley stations in Lemon Grove. Expansion of this mobility hub could include the Spring Valley areas near SR-125 and along Jamacha Boulevard.

**Figure 1 Proposed Mobility Hub Expansions in North and East County**

**Re: Support incorporating *Reconnect Logan, 5 Freeway Lid Project* in the San Diego Association of Governments' (SANDAG) 2021 Regional Plan**

Honorable SANDAG Board,

On behalf of the residents and community leaders of Barrio Logan and Logan Heights, we submit these letters of support for the creation of a priority not currently identified in the 2021 Draft Regional Plan. It is imperative that you incorporate a project to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego's Barrio Logan and Logan Heights communities. Specifically, **we request the addition of a Freeway Lid as a priority project in SANDAG's 2021 Draft Regional Plan (Draft Plan).**

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know *ReConnect Logan Freeway Lid* will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs,

and Phasing, it is appropriate to identify and call out *ReConnect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, *ReConnect Logan Freeway Lid* is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to **the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.**

If you have any questions, you may contact me at 619-887-7292.

Sincerely,

DAVID ALVAREZ

on behalf of ReConnect Logan Community Leaders

cc: Hasan Ikhata

June 5, 2021

San Diego Association of Governments (SANDAG)  
401 B Street, Suite 800  
San Diego, CA 92101

Subject: "Draft" 2021 Regional Plan" -- Chapter 3, How the Budget is Built, Road User Charges, Page 47 and Appendix V: Funding and Revenues, TransNet Program, page V-1 and Regional Road User Charges, page V-18

Dear Sir and Madam:

**We oppose "Road User Charges"** as a funding source that would be incremental / additional to the existing fuel fees and taxes for the transportation infrastructure as outlined in the 2021 Regional Plan Transportation. We request that you oppose implementation of such Road User Charges if they are in addition to the existing fuel fees and taxes.

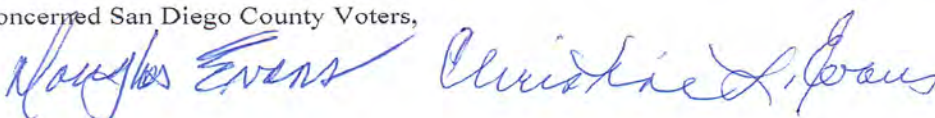

Road User Charges for all vehicles – Internal Combustion Engine (ICE), Electric Vehicles (EVs), Hydrogen, Hybrid, etc. -- is acceptable only if the State, County and City fuel fees (\$0.389/gallon) and taxes (California -- \$0.612/gallon)<sup>1)</sup> are eliminated. If those fees and taxes are eliminated, then implementing a Road User Charge of \$0.27/mile, which would generate the equivalent revenue as the current fuel fees and taxes would be reasonable (calculation assumptions -- average fleet fuel economy of 37.5 miles/gallon<sup>2)</sup> and miles driven per year of 12,524<sup>3)</sup>). If the fuel fees and taxes are not eliminated, then Road User Charges should be implemented for ICE vehicles. Such charges could be added to the non-ICE vehicle's license fee – EVs, Hydrogen, Hybrid, etc.

**Use the fuel fees and taxes (federal and state of \$1.19<sup>1)</sup>) as intended** by the voters instead of diverting gas fee and tax revenues into other projects. From the Los Angeles Daily News<sup>4)</sup>, "The gross misspending, waste and diversion of gas tax revenues into projects having nothing to do with roads or highways. Caltrans admits that as it tries to focus available funding on core system assets, it is simultaneously increasing our investment in bicycle and pedestrian transportation. Gov. Newsom signed an executive order in 2019 that redirected gas tax money to fund railway systems and other non-road projects. Although SB 1 raised taxes with the promise that the money would be used to repair crumbling roads and bridges, about 30 percent of the revenue raised by the tax hike is designated for other transportation priorities, including public transit, bike lanes and walk paths." From the Fresno Bee<sup>5)</sup>, another disturbing example of diverting funds from their intended purpose, Gov. Gavin Newsom issued [executive order N-19-19](#), which obligates the state transportation agency to leverage transportation spending on projects such as strategically directing discretionary transportation investments in support of housing production near available jobs and in accordance with the state's smart growth principles. **Stop diverting funds from their intended purpose.**

If projects for transportation in addition to roads and / or other non-transportation projects are needed, then put such projects on the ballot for a vote by the citizens of San Diego County / California to approve or reject a tax for such needs. Do not use the "bait and switch" tactic on the citizens of San Diego County. **Use fees and taxes for their intended purpose – PERIOD!**

Thank you for your attention to this matter. **We look forward to hearing your opposition to the Road User Charges as outlined in the SANDAG 2021 Regional Plan.**

Concerned San Diego County Voters,

Keri Robinson  
Senior Planner  
SANDAG  
401 B Street, Suite 800  
San Diego, CA 92101

***Re: EHC Comments on SANDAG'S Appendix Y: Goods Movement Planning and Draft 2021 San Diego and Imperial Counties Freight Gateway Study Update***

Dear Ms. Robinson:

EHC's initial comments on SANDAG's Appendix Y: Goods Movement Planning and Draft 2021 San Diego and Imperial Counties Freight Gateway Study Update are summarized below and subsequently detailed in this letter for your consideration:

**High-Level Comments/Recommendations:**

- ZE drayage trucks (100 mile + range) are commercially available now and also comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.
- Zero emission drayage trucks should be the focus of regional efforts vs. near zero emission technology.
- Misclassification of workers needs to be explained and addressed in the SANDAG report.
- The Gateway Study should address potential impacts of climate change on 2050 freight projections.
- Policies should be included to support workers whose jobs may be at risk as a result of a shift to automation.
- Short sea shipping (e.g., marine highway) needs further analysis to know how this mode shift would impact air quality in Portside communities.
- Heavy duty charging facilities must be planned and installed in readiness for the transition to ZEV trucks that is mandated in California and the earlier goals established in the Community Emission Reduction Plan and the upcoming Maritime Clean Air Strategy.
- Regarding outbound cargo, it appears unnecessary to develop new imports of sand, gravel, and aggregate into the region.

## Detailed Comments/Recommendations:

A. ZE drayage trucks are commercially available now and also comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.

1. In section 4.1 (page Y-165), it states that “Port of SD: ZE vans and trucks ***may*** be suited to accommodate demand for goods movement in the area while reducing air quality and noise impacts, given the volume of local truck trips and improvements in ZE technologies....”. Data indicates that these local trips, as well as much longer drayage trips, are already feasible today with ZE drayage trucks.
2. Per the Port of San Diego study (November 2020)<sup>1</sup>, ZE drayage trucks with a range of over 100 miles are commercially available today. The Port study explains that:
  - a. Five different ZE drayage trucks are expected to be commercially available by the end of 2020, while another seven should become available by 2022/2023. Each has a range of over 100 miles, which is enough to complete the average drayage truck duty cycle of less than 100 miles on a single charge;
  - b. The range of existing electric Class 8 trucks cap out at around a 150-mile range on a single charge;
  - c. ZE drayage trucks requiring more than 150 miles will be available soon; and,
  - d. Truck ranges are expected to increase as manufacturers develop longer-range batteries with the Tesla semi planned to exceed 500 miles near the 2023 timeframe.
3. ZE drayage trucks are comparable in costs today along with increasingly positive total cost of ownership (TCO) in years ahead.
  - a. A Lawrence Berkeley National Laboratory (March 2021)<sup>2</sup> study concludes that a Class 8 electric truck operated 300 miles per day when compared to a diesel truck offers a roughly 3-year payback and net present savings of about \$200,000 over a 15-year lifetime."
  - b. The 2035 Report 2.0: Plummeting Costs and Dramatic Improvements In Batteries Can Accelerate Our Clean Transportation Future from UC Berkeley’s Goldman School of Public Policy (April 2021)<sup>3</sup> explains that the TCO for heavy duty electric vehicle starts out as positive compared to diesel and gets substantially better through 2035.

B. ZE drayage trucks (not near-zero) trucks are needed to reach air quality and climate goals.

1. EJ communities and Climate Action Plans require ZE (not near zero) trucks. However, the SANDAG report encourages and/or assumes near zero. On page Y-29, it states “.....In addition to the international gateway forecast, develop a freight forecast to 2050 for three specific urban areas of the Gateway Region that addresses emerging freight trends, such as the transition to zero/***near-zero-emission*** freight vehicles...”.

---

<sup>1</sup> [https://pantheonstorage.blob.core.windows.net/ceqa/MCCW\\_Vol\\_1\\_Final\\_SEIR.pdf](https://pantheonstorage.blob.core.windows.net/ceqa/MCCW_Vol_1_Final_SEIR.pdf)

<sup>2</sup> [https://eta-publications.lbl.gov/sites/default/files/updated\\_5\\_final\\_ehdv\\_report\\_033121.pdf](https://eta-publications.lbl.gov/sites/default/files/updated_5_final_ehdv_report_033121.pdf)

<sup>3</sup> <https://2035report.com/transportation/>

2. The Luskin Report (2019)<sup>4</sup> specifically warns against meeting any short-term uptick in drayage truck turnover with natural gas trucks. The report explains that if investments focus on natural gas trucks as the primary replacement, more natural gas fueling stations will be needed. Given goals to transition to zero-emission trucks, these investments will inevitably be stranded or the ZE transition will be delayed unnecessarily.
- C. Misclassification of truck drivers needs to be explained in report.
1. Misclassification of truck drivers in California needs to be explained in the SANDAG report. On page Y-24, it states "...A large portion of truck operators in the freight industry are independent contractors who own their own vehicles and work for larger corporations. As policies start to implement regulations that discourage the continued use of heavy-duty diesel trucks and enforce the use of zero-emission vehicles, **independent truck owners will be left with outdated vehicles they can no longer use**, leading to potential unemployment for these operators...".
  2. The drayage, package delivery, and other short-haul segments of the trucking industry are home to ongoing and egregious worker exploitation.<sup>5</sup>
  3. Trucking companies, brokers, and other contracting entities often illegally misclassify drivers as independent contractors (when they are employees by law) to avoid paying wages, benefits, equipment costs, taxes, and regulatory compliance costs.<sup>6</sup>
  4. Misclassified drivers operate 70 to 90% of California's drayage trucks, making misclassification the drayage segment's dominant business model.<sup>7</sup>
- D. The Freight Gateway Study should address potential impacts of climate change on goods movement.
1. The Gateway Study did not address potential impacts of climate change on 2050 freight projections. Impacts are difficult to predict, but it would be reasonable to develop scenarios that do not assume simple linear growth in freight volumes, due to disruptions in supply chains, extreme weather events, sea level rise, and potential changes in key industries in the San Diego region such as agriculture, construction, and tourism. As overarching policy directions, the San Diego region must plan for producing critically important goods closer to home, and reducing our dependence on goods movement as an economic driver.
- E. Additional Comments on Goods Movement Planning and the Freight Gateway Study.

<sup>7</sup> Bensman, Misclassification: Workers in the Borderland, 2014, available at [https://papers.ssrn.com/sol3/papers.cfm?abstract\\_id=2383396](https://papers.ssrn.com/sol3/papers.cfm?abstract_id=2383396).

1. Appendix Y correctly notes the importance of equity for workers in the freight industry, but mentions the potential impact of automation only in passing, on page Y-5. SANDAG needs to address the challenges of automation more fully. Who makes the decisions to automate unloading, loading, or movement of freight? What opportunities are there for workers and the public to participate in these decisions? What policies are in place, or needed, to support workers whose jobs may be at risk as a result of a shift to automation? Until these questions are answered fully, SANDAG's goods movement planning will be failing these workers.
2. Marine Highway M-5 is mentioned briefly on page Y-8 as a potential new source of trade. Short sea shipping may be a good option for reducing GHG and truck traffic. At the same time, Portside residents need to know how this mode shift would impact air quality in their communities. Will additional ships be coming to San Diego's cargo terminals if the project is approved? Will these ships be shorepowered? Goods movement planning requires that local impacts be identified and addressed.
3. Urban warehouses for e-bike deliveries are mentioned as an innovative delivery option on page Y-26. It is important to be clear that if trucks will also be accessing these facilities, they do **not** belong in residential areas. Residents of Barrio Logan and west National City have struggled for decades to eliminate incompatible land uses such as warehouses from their communities.
4. Regarding infrastructure needs for truck freight hauling, the report, in Section 2.1.2.1. Gaps in Existing Road Infrastructure, correctly notes the lack of dedicated truck parking, staging, and queuing facilities. Another essential piece of freight infrastructure planning: EV charging facilities for MD/HD trucks. Charging facilities must be planned and installed in readiness for the transition to ZEV trucks that is mandated in California.
5. Regarding outbound cargo, Figure 3.14 on page Y-129: Gravel is the largest outbound cargo, by tonnage, at 3,505 tons. This is a category of commodity that also includes aggregate. Sand is also a large outbound commodity, at 1,086 tons. It appears unnecessary to develop new imports of sand, gravel, and aggregate into the region, and unlikely to produce reductions of emissions from trucks.

Thank you for your time and consideration. Please contact Danny Serrano, Campaign Director at [dannys@environmentalhealth.org](mailto:dannys@environmentalhealth.org) for any additional information.

#### Comments on the Draft 2021 Regional Plan - 8/4/2021

Our comments are focused on the geographic area that we are most familiar with: the area within and extending out from the I-805 / SR-52 / I-5 triangle. This includes the Rose Creek watershed (Rose Canyon, MCAS Miramar, San Clemente Canyon and Marian Bear Park, and Rose Creek extending south to Mission Bay) and the Carrol Canyon, Sorrento Valley, and Penasquitos Lagoon watershed. However, many of the concerns, issues and questions we raise in relation to this area apply to the entire RTP.

Our overall comment is that the 2021 Draft Regional Plan states that it proposes a bold new vision. However, it is based on a massive expansion of our highways. This includes widening many of our highways to add Managed Lanes and adding huge, elevated concrete “Managed Lane Connectors” ( MLCs) where highways intersect. These MLCs will require even further highway widening to add lanes where traffic would enter and exit the connectors. In some cases these MLCs connect highways at very different elevations or with multiple other on and off ramps and bridges in the same location. Judging from just the area we focus on, these added MLs and MLCs will have huge direct and indirect environmental impacts on sensitive habitat, MSCP lands, Marian Bear Park, Rose Canyon Open Space Park, MCAS Miramar, and the Rose Creek and Carroll Canyon Creek/Sorrento Valley/Penasquitos Lagoon watersheds. Furthermore, just in the area we focus on, these MLs and MLCs will cost many hundreds of millions of dollars.

We ask: How much induced demand will adding all this highway capacity cause? How sure is SANDAG of their calculations? Will this plan really reduce GHG emissions, and by how much? How sure is SANDAG of those calculations? What is the course correction if we start adding all this highway capacity and the benefits are not there? Do the RTP models rest on the assumption that the projected benefits require that all the highway MLs and all the MLCs be added to achieve the projected benefits? What if we get half way into building this out and find that adding all this highway capacity is not bringing the benefits anticipated?

Based on what we see proposed for just the area we focus on, we see major direct and Indirect Impacts on MSCP lands, open space, habitat, native plant and animal species, wildlife corridors, creeks, and watersheds. Adding Managed Lanes and Managed Lane Connectors means bulldozing land and building extensive new concrete surfaces and retaining walls and drainage ditches, expanding direct impacts and edge effects on habitat and wildlife, increasing storm water run-off, noise and light impacts, invasive species, habitat loss, loss of wildlife connectivity and wildlife corridors, increased erosion, trash, and air and water pollution. “Mitigating” these impacts through projects done in distant mitigation banks does nothing to reduce the impacts in the areas where these impacts occur.

While SANDAG staff have stated in meetings with the QOL coalition that they are not widening outside the highway ROWs, that does not mean there won't be major highway widening and environmental impacts. In some cases, CALTRANS has sufficient ROW to widen by multiple lanes. And widening even within the ROW extends the damaging impacts and pushes the edge effects closer to and into sensitive habitat.

Meanwhile, the Purple Line (Commuter Rail 582) from Sorrento Mesa to the Border (a true transit project) will not be completed until 2050. In concept, we strongly support this project, assuming it is largely underground through the environmentally sensitive areas we focus on. But despite the importance of this transit project, we know little beyond the vaguest description of its route. Where might it be underground? Where might it be at grade or above grade? Why is it not being completed until 2050 while the RTP prioritizes adding so many highway MLs and MLCs?

### **I-805 North Project**

On April 15, 2021, the Sierra Club sent the attached letter to SANDAG Director Hasan Ikhata, Director of Regional Planning Coleen Clementson, Senior Transportation Planner Jennifer Williamson, and several SANDAG BOD members. At a subsequent meeting with the Quality of Life Coalition's Transportation Committee, Coleen Clementson stated vehemently, "We agree with you." We therefore assume and would like confirmation, that the following is not in and will not be added to the RTP for the I-805 North from just south of SR-52 to Carroll Canyon Road:

- Any additional freeway widening beyond what has currently been built (one Carpool/ HOV lane in each direction was completed in 2016)
- Widening of the I-805 bridge over Rose Canyon
- Direct Access Ramps (DARs) at Nobel Drive
- A Park & Ride at the southwest corner of Nobel/I-805
- A bus station at the southwest corner of Nobel/I-805

### **Project ID CC114 is called I-805 (Nobel Drive) - it should be deleted from the RTP**

**Rationale:** I-805 North should locate access to and from the Managed Lanes at La Jolla Village Drive, not Nobel Drive. La Jolla Village Drive has extensive high density employment and high density housing located between the LJVD/I-805 intersection and Genesee Avenue. At Genesee there are two trolley stations surrounded by existing and planned high density employment and housing. La Jolla Village Drive is the route BRT lines should use to enter and exit the I-805 MLs. Nobel Drive is a poor location for a BRT route to enter or exit I-805 MLs. The location is far from significant employment or housing density. Furthermore, no parking lot or bus station should be located at Nobel/805. The I-805 commute is south to north in the morning, so parking lots near the I-805 should be located in communities well to the south where commuters come from in the morning. The land at the Nobel/ I-805 intersection should be protected from any further impacts. Most of it is MSCP, and there are vernal pools and numerous documented sensitive species. That area should have no further disturbance.

## **The area within and near the SR-52, I-805, I-5**

**The RTP should reduce the amount of highway expansion and the number of MLCs in this area. SR-52 should not be widened and the MLCs between these highways should be eliminated.**

**The following projects would cause major environmental damage to MSCP lands and to the area's critical and already highly constrained wildlife corridors.**

This area illustrates our concern about the RTP as a whole. The RTP proposes a massive expansion of highway capacity in the name of creating "Complete Corridors" that will, in theory, carry BRT lines and carpools. While it is true that some existing general purpose lanes will be converted to "Managed Lanes", the RTP proposes an expansion of all the highways in this area to add MLs plus multiple MLCs between these highways that will further degrade the habitat and wildlife corridors.

**CC085: 2035 - MLC I-805 (SR 52) West to North and South to East CCT - \$149 mil**

This MLC will cause major environmental damage to an area with important wildlife corridors that connect MCAS Miramar, San Clemente Canyon (and Marian Bear Park) and Rose Canyon. These wildlife corridors are identified in the MSCP and in the MCAS Miramar Natural Resource Management Plans. The wildlife corridor between MCAS Miramar and San Clemente Canyon is already highly constrained at the I-805/52 intersection. In addition, the elevation change between the I-805 and SR-52 is significant. A further environmental impact will occur due to adding two MLs to SR-52 east of I-805 and one ML to SR-52 west of I-805.

**CC086: MLC I-805 (SR52) North to West and East to South (\$126 mil):** More environmental impacts in this same area.

**CC003 - (by 2035) - I-5 (Pacific Highway to SR 52) 8F to 6F+4 ML (\$353 mil) (adding 1 lane in each direction to I-5)**

**CC004 by 2035 I-5 (SR 52 to I-805) 8F to 6F + 4ML (adding one lane in each direction) (\$190 mil)**

**CC028 by 2050 MLC I-5 (SR 52) South to East and West to North (\$202 mil)**

**CC065 by 2050 Complete Corridor: ML SR 52 (I-5 - I-805) 4F to 4F + 3 ML (\$214 mil)**

This massive widening of SR 52, with additional width needed to build the Managed Lane Connectors between I-5/52 and SR 52/ I-805 (MLCs in all directions) will have huge negative impacts on the adjacent MSCP lands in San Clemente Canyon and Marian Bear Park and on Rose Canyon and on the wildlife corridors between

**CC066 by 2050 I-5 (SR 52) MLC - North to East and West to South (\$202 mil)**

# SIERRA CLUB

SAN DIEGO CHAPTER

April 15, 2021 - via email

Re: **Sierra Club San Diego Chapter opposition to potential projects on the I-805 North**

Dear Chair Blakespear,

Since 1948 Sierra Club San Diego has earned a leadership role in the conservation of our County's natural resources. Presently, with more than 40,000 members and supporters, the San Diego Chapter is continuously addressing planning by all regional agencies. Particular attention is focused on the avoidance of impacts to the biological diversity which is so crucial to our quality of life. Sierra Club requests consultation and a place at the table whenever SANDAG is considering any of the following proposals.

**Sierra Club strongly opposes the following proposed projects for the I-805 North, from just south of SR-52 to Carroll Canyon Road:**

- Any additional freeway widening beyond what has currently been built (one Carpool/ HOV lane in each direction was completed in 2016)
- Widening of the I-805 bridge over Rose Canyon
- Direct Access Ramps (DARs) at Nobel Drive
- A Park & Ride at the southwest corner of Nobel/I-805
- A bus station at the southwest corner of Nobel/I-805

**We oppose the inclusion of any of these projects in the 2021 Regional Plan.**

- These projects (or any projects with a similar footprint) would:
  - Destroy and degrade native habitat in Rose Canyon that is part of the last remaining greenbelt and wildlife corridor connecting habitat west of I-805 with habitat on MCAS Miramar. The important wildlife corridor in Rose Canyon under the existing I-805 bridge is recognized in both the MSCP and the MCAS Miramar Natural Resources Management Plan.
1. Destroy and degrade core MSCP habitat.
  2. Destroy and degrade habitat with numerous sensitive plant and animal species, including:
    - Vernal pools
    - Rare Quercus Dumosa (Nuttall's scrub oak)
    - MHPA habitat with documented California Gnatcatchers as well as numerous other sensitive species

Thank you Chair Blakespear for your attention to our request for inclusion in the process. Retaining San Diego's reputation as a world renowned "biological hotspot" is a goal we must all strive for.

Sincerely,

Dave Grubb,  
Chair, Transportation Committee, Sierra Club San Diego Chapter  
George Courser,  
Chair, Conservation Committee, Sierra Club San Diego Chapter

Submitted via email: [SDForward@sandag.org](mailto:SDForward@sandag.org)

Comments on the Draft 2021 Regional Plan

Active Transportation Projects:

**The City of San Diego's chosen alignment for the Coastal Rail chosen between Gilman/La Jolla Colony Drive and Sorrento Valley Coaster Station should be added to the RTP and the old alignment should be deleted (Rose Canyon, "UTC" (along Judicial Drive), Roselle Canyon and Roselle St to the Sorrento Valley Coaster station). This old alignment was thoroughly studied and rejected due to multiple major problems.**

The Draft RTP contains inconsistent and out-of-date labeling of a portion of the City of San Diego's Coastal Rail Trail. The City is the Lead Agency for the Coastal Rail Trail in the City, and it has selected the alignment and completed final design of the alignment along Gilman Drive to UCSD.

The City has deleted from its Bike Master Plan the old Rose Canyon, "UTC", and Roselle Canyon alignment. The City studied that route for years and rejected it for multiple reasons.

The RTP therefore needs to:

- cut three planned CRT segments and trim one CRT segment
- relabel the CRT route in the RTP to coincide with the approved Gilman Drive CRT segment, adding the UC San Diego CRT segment plus the I-5 Bicycle Corridor.
- Amend Appendix A and Appendix L in the SANDAG RTP to be consistent with this change.

The RTP should make the following changes summarized in the following tables:

CRT route as presented in the SANDAG RTP

SANDAG Project ID	Name/Description	SANDAG 2020 Cost	The RTP should make the following change	RTP Page reference
AT032	CRT - Carmel Valley to Sorrento to Roselle Canyon	\$20M	Change Carmel Valley to Roselle via Sorrento by removing Sorrento to Roselle. Carmel Valley to Sorrento remains.	Appendix A Table 1 p. A-6
AT036	CRT - Roselle Canyon	\$12M	Cut	Appendix A Table 1 p. A-6
AT037	CRT - UTC to Rose Canyon	\$11M	Cut	Appendix A Table 1 p. A-6
AT023	CRT - Rose Canyon	\$31M	Cut	Appendix A Table 1 p. A-8

The RTP needs to add the CRT route the City of San Diego has chosen for the segment from Sorrento Valley Coaster Station to the Gilman Drive/La Jolla Colony intersection

Segment	Start	End	Notes
CRT – I-5 Bicycle Corridor	Sorrento Valley	Voigt and Gilman	Already completed by Caltrans
CRT - UC San Diego	Voigt and Gilman Dr.	Gilman and La Jolla Village Dr.	UC San Diego is adding major bike infrastructure improvements through the campus on this route
CRT - Gilman	Gilman Dr. and La Jolla Village Dr.	Gilman Dr. and I-5 / Rose Creek Bike Path and La Jolla Colony Dr.	Protected bike lanes fully designed by City. Partial construction funding in SD City 2022 CIP budget.

## **Reallocation of funds and equity**

The savings for the three old, out-of-date segments to be cut is \$53 million (Rose Canyon, UTC (Judicial Drive) and Roselle Canyon, plus any savings from trimming the route AT032 by cutting Sorrento to Roselle, a segment made unnecessary by the I-5 bike path from the Sorrento Valley Coaster Station to UCSD. Two of the three segments in the City's chosen CRT route are either complete or funded, so it can be anticipated that almost all of the \$53 million in the RTP can be freed up for active transportation projects that address equity, for example, in Chollas Creek, South Bay, or the Midway Corridor.

## **Community and City of San Diego support and action for the CRT alignment up Gilman:**

The CRT route has City and Community support:

- The SANDAG RTP routes do not exist in the City of San Diego Bike Master Plan. They were explicitly deleted by the San Diego City Council in December 2013.
- The approved CRT Project route in San Diego has been selected, with the final Gilman Dr. link ready for construction and on the CIP list for 2020-2021.
- The approved CRT route was developed and selected by a City of San Diego Public Working Group in 2013-2014.
- The approved CRT route is supported by the Community Planning Groups: the UCPG in 2013 and 2021, and the La Jolla Planning Association in 2021.
- The approved CRT route has been supported by the City of San Diego in 2013, 2016 and budgeted in 2021.

## **The City's approved CRT route enhances important existing connections:**

- With the Rose Creek bikeway open, it is a connecting link to UC San Diego from the south.
- With the existing I-5 Bicycle Corridor, it is a connecting link to UC San Diego from Sorrento and the Coaster.
- The completed UC San Diego Gilman Bridge over I-5 provides comfortable and safe bicycle links to the east UC San Diego Campus, industry along Eastgate Mail, and the commercial center at UTC.

Honorable Catherine Blakespear, Board Chair  
and Board of Directors  
San Diego Association of Governments  
401 B Street, Suite 800  
San Diego, CA 92101  
[SDForward@sandag.org](mailto:SDForward@sandag.org)

*Re: Draft 2021 Regional Plan*

Dear Chairperson Blakespear and SANDAG Board of Directors:

This firm represents Lakeview 1, LLC, Lakeview 2, LLC and Moller Lakes Investment, LLC (collectively, Lakeview), owners of the approved Otay Ranch Resort Village Project (Resort Village).<sup>1</sup> On behalf of Lakeview, we have reviewed SANDAG's Draft 2021 Regional Plan (Draft Plan) and provide the comments that follow below.

As relevant background, the Resort Village is part of the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in November 2020, approved the Resort Village for 1,938 residential units, a resort, and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which the Resort Village is a part—has been accounted for in regional plans and projections since 1993.

As discussed below, it appears that SANDAG's Draft Plan has omitted from its design assumptions the Resort Village and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of the Resort Village as a fully-entitled project.

We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a "forecasted development pattern" that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources

---

<sup>1</sup> The Resort Village also is referred to as Village 13.

SANDAG  
August 3, 2021  
Page 2

Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), *and* (iii) utilize the “most recent planning assumptions.” (Draft Plan, p. 19). SANDAG reports that its SCS will exceed CARB’s 2035 reduction target for the region by one percent; i.e., a 19 percent reduction is required and the SCS, if implemented, will realize a 20 percent reduction.

We provide the following comments on the Draft Plan, including its SCS:

1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions *considering local general plans* and other factors” (italics added). In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to ensure SANDAG’s compliance with this statutory requirement for its SCS. Specifically, the referenced figures show approved and entitled development located within Otay Ranch—including the Resort Village—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect. The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Resort Village in 2020. As such, it results in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-approved by the County and long-recognized by its General Plan for this portion of unincorporated South County.
2. The Draft Plan’s forecasted development pattern will not accommodate the RHNA. Specifically, the Draft Plan—in Table F.3 of Appendix F—projects the construction of just 7,419 dwelling units in unincorporated County areas over the next roughly 30 years (through 2050). This number does not accurately represent the amount of approved, planned and reasonably anticipated growth in the unincorporated areas. For example, in the 6th RHNA Cycle, which covers the 2021 through 2029 planning period (and thus does not align with the 2035 horizon year of the SCS modeling), SANDAG assigned 6,700 dwelling units to the unincorporated areas.<sup>2</sup> Therefore, it appears the Draft Plan assumes that a mere 719 additional units will need to be built in unincorporated areas between 2030 and 2050, an assumption that is at odds with reasonable approximations of future RHNA cycles and existing market supply-and-demand evaluations for the San Diego region. The Draft Plan’s assumption of 7,419 units also is approximately 1/8<sup>th</sup> of the County’s General Plan build-out capacity of approximately 65,000 dwelling units. Thus, we respectfully request that SANDAG reevaluate the reasonableness of its forecasted development pattern by way of housing growth assumptions. It is critical to ensure that all modeling inputs are informed and reasoned, such that the SCS quantification analysis is defensible.

---

<sup>2</sup> SANDAG, *6th Cycle Regional Housing Needs Assessment Plan* (July 10, 2020), Table 1.1, available at [https://www.sandag.org/uploads/projectid/projectid\\_189\\_27782.pdf](https://www.sandag.org/uploads/projectid/projectid_189_27782.pdf).

SANDAG  
August 3, 2021  
Page 3

3. It is unclear to what extent the SCS and its supporting quantification framework account for the home-to-work, interregional commute reality present in San Diego. We know that the San Diego region's failure to provide sufficient in-County housing opportunities has resulted in the exportation of some San Diego workers who now must commute into the region from more affordable housing opportunities in Riverside County or Mexico.<sup>3</sup> The spirit of Senate Bill (SB) 375, which created the statutory framework for SANDAG's SCS, will not be met unless and until we grapple with how land use choices made in the San Diego region affect San Diego workers. The Draft Plan must clarify SANDAG's strategies for reducing interregional commuting. Such strategies must ensure a sufficient quantity of in-County housing opportunities exists; otherwise, home-to-work, interregional commuting will continue to be a major problem.

In closing, we recognize that the transformation of San Diego's transportation patterns, long in the making, has been a "slow-and-steady wins the race" undertaking by SANDAG. We appreciate the opportunity to review and provide input on this Draft Plan, and are committed to advancing practical and effective strategies for the reduction of vehicle miles traveled and GHG emissions while developing much needed housing opportunities for the region. Thank you for your consideration of these comments.

Sincerely,

David P. Hubbard

*Re: Draft 2021 Regional Plan*

Dear Chairperson Blakespear and SANDAG Board of Directors:

This firm represents GDCI Proctor Valley, L.P., owner of the approved, but not yet constructed Adara community located in Otay Ranch's Village 14 and Planning Areas 16 and 19. On behalf of GDCI, we have reviewed SANDAG's Draft 2021 Regional Plan and provide the following comments thereon.

As relevant background, Village 14 and Planning Areas 16 and 19 are part of the Otay Ranch General Development Plan/Subregional Plan approved by the County of San Diego and City of Chula Vista in 1993. Otay Ranch, portions of which have been built out, is a complete community approved for 24,000 homes; commercial/retail uses; other non-residential uses; schools and public services; parks, recreation facilities, open space and a protected biological preserve; and complementary amenities designed to be developed over a 30- to 50-year period. Consistent with the land use parameters established in 1993 for Otay Ranch, the County of San Diego Board of Supervisors, in June 2019, approved the Specific Plan and Tentative Map for the Adara community for up to 1,119 residential units and other complementary uses (such as parks and trails, a public safety site, an elementary school, and resident-serving commercial). As a general matter, development of the approved Otay Ranch planned community—of which Village 14 and Planning Areas 16 and 19 is a part—has been accounted for in regional plans and projections since 1993.

As discussed below, however, it appears that SANDAG's Draft Plan has omitted from its design assumptions the Adara community and its approved uses, resulting in a disconnect between the Draft Plan and the legal status of Adara as a fully-entitled project located within Otay Ranch.

We understand that the Draft Plan strives to transform the way San Diegans move through and about the region in an effort to address safety, traffic congestion, social inequities, air pollution and greenhouse gas (GHG) emissions. The Draft Plan includes an updated Sustainable Communities Strategy (SCS), which sets forth a "forecasted development pattern" that is designed to: (i) achieve per capita GHG reduction targets set for the region by the California Air Resources Board (CARB), (ii) accommodate the Regional Housing Needs Assessment (RHNA), and (iii) utilize the "most recent planning assumptions." (Draft Plan, p. 19). SANDAG reports that its SCS

SANDAG  
August 5, 2021  
Page 2

will exceed CARB’s 2035 reduction target for the region by one percent; i.e., a 19 percent reduction is required and the SCS, if implemented, will realize a 20 percent reduction.

We provide the following comments on the Draft Plan, including its SCS:

1. Government Code section 65800, subdivision (b)(2)(B) requires SANDAG “to use the most recent planning assumptions *considering local general plans* and other factors” (italics added). In this regard, Figures F.7, F.8 and F.9 in Appendix F of the Draft Plan are in error and must be corrected to ensure SANDAG’s compliance with this statutory requirement for its SCS. Specifically, the referenced figures show approved and entitled development located within Otay Ranch—including Village 14 and Planning Areas 16 and 19—as “Vacant” on the SCS’ land use pattern maps for 2025, 2035 and 2050. This is obviously incorrect.<sup>1</sup> The “Vacant” appellation is inconsistent with the County’s approval of its General Plan in 2011, the Otay Ranch General Development Plan/Subregional Plan in 1993, and the Adara Specific Plan and Tentative Map in 2019. As such, it results in development forecasts that are incorrect and incapable of supporting the Draft Plan’s findings and objectives. Therefore, we respectfully request that SANDAG modify the referenced figures to reflect the land use densities long-approved by the County and long-recognized by its General Plan for this portion of unincorporated South County.
2. The Draft Plan’s forecasted development pattern will not accommodate the RHNA. Specifically, the Draft Plan—in Table F.3 of Appendix F—projects the construction of just 7,419 dwelling units in unincorporated County areas over the next roughly 30 years (through 2050). This number does not accurately represent the amount of approved, planned and reasonably anticipated growth in the unincorporated areas. For example, in the 6th RHNA Cycle, which covers the 2021 through 2029 planning period (and thus does not align with the 2035 horizon year of the SCS modeling), SANDAG assigned 6,700 dwelling units to the unincorporated areas.<sup>2</sup> Therefore, it appears the Draft Plan assumes that a mere 719 additional units will need to be built in unincorporated areas between 2030 and 2050, an assumption that is at odds with reasonable approximations of future RHNA cycles and existing market supply-and-demand evaluations for the San Diego region. The Draft Plan’s assumption of 7,419 units also is approximately 1/8<sup>th</sup> of the County’s General Plan build-out capacity of approximately 65,000 dwelling units. Thus, we respectfully request that SANDAG reevaluate the reasonableness of its forecasted development pattern

---

<sup>1</sup> As noted in our August 3, 2021 comment letter submitted on behalf of Lakeview 1, LLC, Lakeview 2, LLC and Moller Lakes Investment, LLC, the very same mislabeling error has occurred in the Draft Plan’s referenced figures with respect to Otay Ranch’s Village 13.

<sup>2</sup> SANDAG, *6th Cycle Regional Housing Needs Assessment Plan* (July 10, 2020), Table 1.1, available at [https://www.sandag.org/uploads/projectid/projectid\\_189\\_27782.pdf](https://www.sandag.org/uploads/projectid/projectid_189_27782.pdf).

by way of housing growth assumptions. It is critical to ensure that all modeling inputs are informed and reasoned, such that the SCS quantification analysis is defensible.

3. It is unclear to what extent the SCS and its supporting quantification framework account for the home-to-work, interregional commute reality present in San Diego. We know that the San Diego region's failure to provide sufficient in-County housing opportunities has resulted in the exportation of some San Diego workers who now must commute into the region from more affordable housing opportunities in Riverside County or Mexico.<sup>3</sup> The spirit of Senate Bill (SB) 375, which created the statutory framework for SANDAG's SCS, will not be met unless and until we grapple with how land use choices made in the San Diego region affect San Diego workers. The Draft Plan must clarify SANDAG's strategies for reducing interregional commuting. Such strategies must ensure a sufficient quantity of in-County housing opportunities exists; otherwise, home-to-work, interregional commuting will continue to be a major problem.

In closing, we recognize that the transformation of San Diego's transportation patterns, long in the making, has been a "slow-and-steady wins the race" undertaking by SANDAG. We also appreciate the opportunity to review and provide input on this Draft Plan, and are committed to advancing practical and effective strategies for the reduction of vehicle miles traveled and GHG emissions while developing much needed housing opportunities for the region. In the spirit of continued engagement, we formally request a meeting with the SANDAG staff members principally responsible for preparation of the Draft Plan in order to further discuss our comments herein. I can be reached at 760-431-9501 or [dhubbard@gdandb.com](mailto:dhubbard@gdandb.com) for purposes of scheduling the requested meeting. Thank you for your consideration of these comments.

Sincerely,

David P. Hubbard

Annual Event at Perkins Elementary

August 5, 2021

Mr. Hasan Ikhata  
SANDAG, Executive Director  
401 B St, Suite 800  
San Diego, CA 92101

**Re: Support incorporating *Reconnect Logan, 5 Freeway Lid Project* in the San Diego Association of Governments' (SANDAG) 2021 Regional Plan**

Dear Mr. Ikhata,

My name is John Alvarado and my family has lived in Barrio Logan/Logan Heights for over 100 years I'm a retired school teacher and founder and Exec Dir of the Good Neighbor Project SD my home and office is located at 2215 Logan Ave. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego's Barrio Logan and Logan Heights communities. **Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan (Draft Plan)**

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know *Re-Connect Logan Freeway Lid* will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue

"Changing Our World One Neighbor at A Time"

to be a working-class neighborhood composed of nearly 90% Mexican Americans and while we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, it is appropriate to identify and call out *Re-Connect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, *Re-Connect Logan Freeway Lid* is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to **the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.**

If you have any questions, you may contact me at.

John Alvarado Exec. Dir  
Good Neighbor Project SD

## **Critique & Comments on 2021 Regional Transportation Plan - [Levine 7/28/21]**

I have conducted an in-depth review of the 2021 Regional Transportation Plan and wish to share my observations with the SANDAG Board of Directors and other interested SANDAG personnel. I have had an active interest in local governance, following a career in business management. I have elected to evaluate the RTP using business evaluation skills learned in over six decades in project, portfolio, and business management.

This document is in four parts, following this introduction. There is a general presentation of views and concerns. This is followed by a discussion of individual aspects of the RTP. Section three addresses options and impediments. The ending section is a profile of the author.

I need to preface my comments by expressing my admiration for the product that SANDAG has produced and for the investment that has been made in developing a potentially ideal transit-based solution to the environmental and density challenges with which we are faced in this remarkable county. The professionalism and quality exhibited in the published works are of the highest rank and served me well in my quest to understand the goals of the RTP and the methods to achieve them. It is indeed a visionary expression of a world-class system for a future population. I recognize the seriousness of the challenges and I fear for the future of the planet. I applaud the bold and creative efforts to meet these challenges head on, to work to meet state and federal mandates, and to qualify for state and federal funding and subsidies where available.

Nevertheless, I have to take issue with several assumptions and conclusions, as well as expressing my dismay at the massive investment of time, money and intellectual expertise for something that should have been questioned much earlier in the process.

In my consulting practice I have often been engaged to perform due diligence on business cases for major programs and for proposals for new business initiatives. As I became deeply interested in the 2021 RTP, I couldn't help seeing items that sounded alarms and triggered reality checks. As I have seen all too often, the search for the ideal has surpassed the practicalities of what is reasonable and achievable. I also am concerned that the sponsors may have based their assumptions on a best case or "wished for" values rather than a most likely set of scenarios. This plan begs for a responsible investigation and evaluation of the RTP by members of the SANDAG board who will carry the responsibility for this investment in the future. There is actually more at risk than an investment. The county appears to be committed to facilitate and mandate a radical change in the culture and behavior of a vast populace whose lifelong belief is that having a personal vehicle to go anywhere, at any time, is an inalienable right. The board is not voting for a transportation plan. It is voting to mandate a change to the very foundation of our lifestyle. They better get it right. We need to do something that will work.

### **OVERVIEW**

The 2021 Regional Plan, as presented in "San Diego Forward", depicts an environmental utopian paradise. It assumes a coordinated collection of paradigm shifts that support a vision of the ideal sizable urban/suburban metropolis where the government has considered and provided for the mobility of the

populace in the future. A future that requires a major reduction in greenhouse gasses and acceptance of increased housing density. It assumes that the public will readily give up their personal motor vehicles for the common good. SANDAG presents a perfected model that may work on paper. However, there is a huge hurdle to achieving that perfection.

Actually, there are two huge hurdles. One is the nature of people to resist paradigm shifts. Cultures cannot be mandated. They exist by will of the people. The 2021 Regional Plan makes assumptions of colossal culture change that cannot be reasonably presumed. This is a fact of life that governs what can be accomplished, no matter how “good” it is for the people and for the planet. For example we need only look to our current COVID-19 crisis. The only way out of the pandemic is via vaccination. The science is certain. The data is monumentally supportive. Yet, a major portion of the population refuses to do what is good for them and for the nation. Has this artifact of human nature been given adequate consideration in the plan?

The second hurdle, which has led to the demise of even the most seemingly foolproof plans, is the failure to consider the potential downside of the business case. In every plan there is a range of possible outcomes. We can look at the case through three lenses; the optimistic, the most likely, and the pessimistic. Where things fall apart is when exuberant support for the “optimistic” case causes the sponsor to downplay the “most likely” and to ignore the “pessimistic, and the associated risks.”

The pessimistic case fully considers risks. It creates alternate models representing the potential downside. The downside can happen. Even the most infallible plans have collapsed, leading to total failure of the venture, because of the reluctance to use assumptions that consider potential events and conditions that are not of the sponsor’s liking.

Here in San Diego, even in SANDAG, we have a history of inflated assumptions. We have seen it in the forecast of pension funding and in the projection of tax revenues. We have also seen it in the estimates of transit ridership. What assurances can you give the public that the 2021 Regional Plan is not based on inflated assumptions of income, ridership, or even the level of acceptance of change by the public?

Where are the models that represent a lesser level of expectations and what that would mean to accomplishment of the goals? I see a presentation of the ideal. Where is the picture of the realistic?

## **DISCUSSION**

I have watched and read a number of SANDAG presentations and publications. It started with the August 14, 2020 SANDAG presentation of the blueprint for the 2021 RTP. I watched the entire four-hour session and then skimmed through the 619 pages of attachments – educating myself in the details of the proposal. More recently, I have downloaded and examined the May 2021 draft of San Diego Forward: the 2021 regional plan (for public review), as well as Appendix B. And I have watched the full videos of the May 21, 2021 presentation to the SANDAG Board of Directors and the June 28, 2021 North County Inland Road Show. I have also held some discussions with board members or their designated staff members working on the SANDAG proposals.

Sifting through the mounds of data and assumptions, I find numerous areas where the expectations cannot be justified or validated. But before getting into the details, we cannot ignore the human factors in the plan. As much as we might want to focus on the data, it is human behavior that will be the biggest factor in whether this paradigm shift in transportation habits can be accomplished.

Director Ikhata boldly declares that it is the plan's intention to pressure the public to change its wasteful use of personal motorized vehicles as a response to environmental concerns of growing proportions, as well as to meet various government mandates. He talks about incentives. But when queried about how the change in behavioral culture will come about, he repeatedly brings up "pricing". He says "it will work if we price it right." Of course "pricing" is a code word for "fees." Using a euphemism cannot disguise what it is.

Invoking new fees, to use what has been considered to be something already covered by our taxes and DMV fees, is not an incentive. It is a penalty. The plan openly sets out to punish the public for doing what has been considered one of its most appreciated freedoms – the ability to get places, in the comfort and convenience of our own vehicles, on a timetable of our own choosing. SANDAG would have us give up this sacrosanct right and has set about to force the changes upon a recalcitrant public.

The pricing scheme is so devious that it not only imposes fees and taxes (a penalty, not an incentive) to force people to stop doing what is considered an inalienable right, but then directs the funds it collects away from what is wanted by the public (highway improvements). What kind of incentive sets out to punish rather than reward?

Let us not forget or ignore the penalties already inflicted on the driving public and the failures of previously imposed taxes to deliver what was expected or were diverted to other initiatives. For example I submit my motorcycle registration fee of \$233, which would cost me \$13 in NY. Or the income from the ½ percent TransNet sales tax that was grossly underestimated and is slated to be diverted from the highway projects it was supposed to support.

Now, looking at some of the initiatives in the RTP, there are data that belies the expected results. Director Ikhata was asked if he could provide an example of where **MANAGED LANES** was implemented. Oddly I-15 was used as an example. However, the design calls for Managed Lanes for I-5 and CA-78/56/52 without adding new lanes (except for repurposing shoulders), whereas the I-15 project created four additional lanes for HOV or toll-payer use. Unless all of the lanes are contiguous (which they are not) and narrow bridges are widened, the periodic merging of lanes would create new bottlenecks and backups. So would any breakdowns, public safety vehicles, or emergencies that would impact the travel lanes in the absence of shoulders. Is this really safe or practical? How would traffic control (police radar and traffic stops) operate? What happens in a medical emergency or when a vehicle has a mechanical problem, a flat tire, or runs out of gas or battery power? How is congestion reduction alleviated when a lane is isolated for busses? This model of managed lanes is more like a game of whack-a mole. I am apprehensive of drivers' attention being diverted from the road by a system of signs and signals directing them to a particular managed lane that changes with traffic conditions.

How effective would the Managed Lanes concept be if it doesn't involve increased reliable capacity? SANDAG projects an increase in use of mass transit (at peak commuting times) from about 3% to 11.2% (in 2035). Will this be enough to sufficiently impact the carbon reduction goal? SANDAG is also projecting a population growth of 15.2% by 2035. It would seem that the movement of commuters to transit will not be enough to offset the growing demand for roadways. How do we significantly reduce congestion (a key goal) without increasing capacity? Do we gain enough to justify the cost and inconvenience of construction and repurposing plus the imposition of user fees?

On the other hand, there are other conditions that might represent a reduction of emissions-producing vehicles. Among the important forecast values that we must consider for the RTP is the impact of electric vehicles. All manufacturers are making massive investments and commitments to have a majority of their output be EVs, within a decade. Governments are equally committed to replacing petroleum-fueled vehicles by 2035. Are we likely to gain more in the real goal of reduced greenhouse gases through the mandated and incentivized move to EVs?

When the shift to EVs is added to the impacts of more workers not having to drive to an office every day, potentially offsetting the population growth, the expense and "pricing" of the full managed lanes solution may not be warranted. Not if the justification is the reduction in the production of GHG. As an aside, we have to learn not to justify massive, expensive projects because there is government funding earmarked for such programs. Yes, I am thinking of California High-Speed Rail. These programs always end up growing extensively beyond the original (misrepresented) scope and cost, causing the agencies that thought that they were getting a free lunch to bleed real cash.

Let's get back to the "incentives" to get drivers to shun their cars. The "right" pricing essentially means making it painful to pay the VMT (vehicle miles traveled) fees. What I am hearing now is a charge of two cents per mile for the state plus two cents per mile for the county. So a highway trip from Rancho Bernardo to downtown and back would cost about two dollars. That is enough to make people angry, but not enough for them to use other means for travel. If they don't meet the HOV criteria, it's either pay additional fees or be limited to what are designed to be slower lanes. In the latter case, how does that help relieve congestion? It just pushes lower income drivers to use the most congested lanes. How does that support the stated "equality" goals?

The "right" pricing – that is; fees that will cause drivers to shun the controlled highways – may eventually lead to drivers eliminating such trips altogether. That may help the goal of easing congestion. But there will be offsetting penalties if the cancelled trips lead to people not shopping, eating out, or going to entertainment venues. This, in turn, will reduce income from sales taxes as well as impact the bottom line of these businesses (more tax losses). Has this been factored into the equation?

When combined with other initiatives, such as reducing or completely eliminating parking in many areas, both business and residential, the campaign against car owners becomes draconian. The thinking is that if people are using **MASS TRANSIT** and local connection options there will no longer be a need to own a personal vehicle. So whether you're going out to the mountains to go hiking, or over to Costco to load up on groceries and a 30-roll package of toilet paper, can you say that you really don't need a car?

Sure! Hey guys! Let's grab our beach chairs and umbrellas, the cooler, our cornhole game and a couple of surf boards and take the bus over to Cardiff State Beach (from Green Valley in Poway). And we'll stop off for dinner in Rancho Santa Fe on the way home, toting all our stuff. Currently, there is no reasonable mass transit to support that (according to MTS trip planner). The software did come up with a solution that would take four hours just to get to the beach, using four busses and the Sprinter (plus some walking) and told me to start 90 minutes earlier than I had specified. Is better coverage in the works? Would the group be able to make the trip in one day? Could they manage with all their gear?

So let's stop dreaming about a world without cars. Can we be practical and come up with ideas and real incentives to cut down on VMT?

Furthermore, as an "incentive" to dump your car or truck, the plan calls for charging for parking spot use and even to pull over to the curb. Yes, it's in the plan – see page 40 "Parking and curb pricing." Pricing is the term that is used for "fees."

With the estimate of only 11.2% of commuters using mass transit (and less for the general public) what we need is more parking. We shouldn't need to drive around looking for parking spots or hang out at the curb with the motor running. If you want to change behavior, do it with rewards, not with penalties. While there are some interesting ideas in this plan, I predict that the overall result will be to nickel and dime car owners in multiple ways without actually achieving the results that are expected.

The concept of **MOBILITY HUBS** is interesting. Providing flexible transit in selected concentration areas would be sensible and likely take care of some of the "last mile" issues that hinder the practicality of using mass transit. Here again, there are disconnects between wishful thinking and practical outcomes. The mobility hubs may be considered to be frequent destinations for the public. But what do people do on the other end (their origination point) when it's not in a mobility hub area. I reside about 1 ½ miles from the eastern edge of the Rancho Bernardo mobility hub (92128). About half of my family travel is to points within that hub. But how do I get to that hub without a car? (I do use my e-bike for some of this, but not if I am shopping or if I have to cross hazardous intersections, such as the I-15 ramps.)

The expectation that businesses will all of a sudden relocate to properties within a mobility hub is speculative, at the most. Where is the evidence? Furthermore, if the new model is for these businesses to not have parking then the people will choose to take their business elsewhere. In the end, SANDAG may achieve their goal to reduce VMT. The public will do their shopping on-line. They'll enjoy their own cooking at home. And the biggest accomplishment will be a local business decline and more tax losses. The roads will be wall to wall with gas-guzzling Amazon vans.

Bringing usable, frequent **mass transit** services to San Diego is something that we can all appreciate. But assuming that the car culture will significantly change because of the transit improvements is pie in the sky. No amount of disincentives will remove the need for highways and parking.

From a personal perspective (I live in 92128), I see little that serves my needs or interests. This area and adjacent Poway and places east are hardly served (except for a snippet of the RB mobility hub). The proposed Rapid bus is the same as now, except with improved frequency. But the transit stations are

not easily accessible except by car. With all the plans for commuter rail and light rail, the I-15 corridor is ignored. That is; except for the ghost of the California High-Speed Rail, which surprisingly shows up on Figure 2.3 – the Transit Leap map. I suspect that most of San Diego will have fallen into the Pacific before this foolhardy venture reaches any place where people live, let alone stretching south of I-10. Placing it on the Transit Leap map doesn't help to generate any confidence in the rest of the plan.

In regard to this Bakersfield/Fresno/Merced rail, I hear horrifying stories of issues with acquiring land rights. Have the experiences from that venture been factored into the land acquisition needs for transit and mobility hubs? If land acquisition is an issue in the sparsely populated SR-99 corridor, have we honestly considered the challenges in coastal San Diego? Is this a deal killer?

Back to my personal travel habits and needs. I recently purchased an e-bike and use it almost daily. I take it to the tennis courts on week days – just less than a mile and with no major intersections. I love the ride and am happy to not use my gas engine vehicles for such short trips. But the e-bike is not practical for most errands and my primary use is for exercise and recreation. There are several areas where I cannot ride because of poorly maintained bike lanes or unmarked bike lanes in high-traffic streets and intersections. The nearest formal bike trail (I-56) is about a ten mile ride over a treacherous, unmaintained bike lane on Carmel Mountain Road in Rancho Penasquitos. The money available for biking would be better spent on improving these impediments than in uprooting city streets to make us look like Holland. Also, I would not be able to use the e-bike with mass transit because the bike is too heavy to put on the bike carriers. (Does anyone ever use these? I never see a bus with a bike. I also never see a bus with more than two passengers.)

I have not addressed the practicality of the proposed high-speed coastal rail or other light rail expansions due to lack of details. Shouldn't we be looking at a set of alternatives, rather than a single plan? On the LOSSAN corridor segment, I'd like to see figures for a solution based on upgrading the Coaster system, rather than assuming that a new high-speed system is needed to meet our goals. The benefits of a high-speed train tend to be grossly overstated when one considers that the actual rail time is just a small portion of the overall door-to-door trip time. Doubling the speed of a locomotive may equate to a 5% to 10% improvement in trip time. Increasing distances between stations makes the use of high-speed rail less convenient and may add additional time to last-mile segments. Frequency (less waiting time) may contribute more to shortening trips than high speed. It is good to see this in the plan.

On a final note, I am compelled to comment on some disturbing issues relative to the relationships and behavior between the agency (SANDAG), the SANDAG Board of Directors, and the public. There is no way that we can accept the response by Director Ikhata to criticism voiced by board member Rodriguez (Oceanside), at the 5/21/21 SANDAG presentation. Obviously dismissing the board member's right to question the RTP, Ikhata interrupted to say "We are the experts." It is this attitude that highlights the importance of the Board exercising its responsibility to provide oversight and leadership for this important agency.

We must further question the intent of Director Ikhata to influence the recent Supervisor election, and hence the selection of board members by making a political contribution to a likely supportive candidate

in opposition to a candidate that voiced resistance to the developing RTP. How these two incidents can go unchallenged is beyond belief. Where is the oversight?

As I began to follow the RTP, the early news headlines consistently noted the sense that the Board was heavily leaning toward support for the emerging RTP. It appeared to represent a desire to take strong action to deal with the very real concerns regarding global warming and to address how re-envisioned transportation models can contribute to a viable solution.

Politically, it seemed sound to jump on the band wagon. However, as the details of the RTP were meted out to the public, there has been virtually unanimous rejection of the Plan. The public is saying that they do not favor the RTP and cannot see it as something that will produce the stated goals. One comment: "This is NUTS!" The board needs to listen.

As a concerned voter in San Diego County, it is my expectation that our representatives on the SANDAG Board of Governors will ask the type of questions that I highlighted here and to make certain that the RTP is based on honest assessments and assumptions. Due diligence requires that proposals consider a range of outcomes, based on an open-minded assessment of risks and variables. Common sense requires that we fully consider human factors and culture. Transparency should come with honest language that does not sugar-coat the burdens to be placed on the public to gain compliance.

I ask the SANDAG Board of Directors to provide intelligent oversight of SANDAG and the RTP, and to recognize the voice of the people in questioning the rationale and achievability of the proposal.

---

## **OPTIONS AND IMPEDIMENTS TO CONSIDER**

Are there options available to address the goals of the 2021 RTP in more practical ways, with attention to getting the best bang for the buck, while satisfying the wider stakeholder base?

What options should be explored to bring reality closer and the probability of success greater?

What options are available to reward those who go the extra mile to support sensible initiatives, rather to penalize those who may not have the option to comply with these suggested draconian measures?

**High-speed Rail:** Going from 60 MPH to 120 MPH will not deliver a great time savings if distances between stops are greater and time from station to destination is increased. The easiest and most economical way to make train-based travel faster is actually to have stops closer to the "last-mile" and to up the frequency so that travelers don't have to spend the projected time gained waiting for the next train. Commuter rail, with short distances will not gain much from doubling the top speed. Electrification will help acceleration times and reduce GHG emissions. Can we modify what we already have and still achieve our goal -- faster and cheaper? Urban/suburban rail should run every four minutes in peak travel times and every eight minute at other times. At the least a ten minute interval would free travelers from needing to use timetables. Stations should be closely spaced and easily accessible by walkers and bikers as well as personal vehicles. Adequate parking will be needed. Express trains can be added to accommodate longer distance riders.

**Managed Lanes:** The biggest cause of highway congestion is the intermittent loss of a traffic lane. You can see that every day in places like I-15 northbound as it approaches the Bernardo Center Dr. and Rancho Bernardo Rd. interchanges. In this very short distance, the main highway loses one lane (due to narrow overpasses) and the traffic will back up at times of heavy use. Other causes of backups are vehicle breakdowns, police activity, and accidents. There MUST be space for vehicles to pull to the side of the road without losing a traffic lane.

The maximum capacity of any highway is determined by the capacity at its most constricted point. The plan calls for increasing capacity on limited access highways, such as SR-56, by utilizing shoulders. SR-56 would increase from four lanes to seven lanes. However, the inner shoulders are only four to eight feet and they do not continue at the six locations where the highway goes over a bridge. It seems that this would require adding lanes on the existing divider and building six new bridges at the overpasses to accommodate the three additional traffic lanes. Without this, the bottlenecks would nullify any gains from the added lanes.

**Rapid Bus Plazas:** These will have to be considerably upgraded if Rapid Bus is to be a principal component of a four-fold increase in mass transit patronage. As I look at the plaza closest to my residence, Rancho Bernardo, I see some major issues. Parking would have to be significantly increased, since the planned Flexible Fleets in Mobility Hubs will not reach all users. Plazas would likely need to be enlarged. Where will we find the land for this?

Also, at Rancho Bernardo, the transit plaza is not accessible from the east side of I-15. Walkers or bikers cannot readily get to the plaza. This can be remedied by building a pedestrian/biker structure from the east side of the I-15 bus ramp, over the northbound lanes of I-15 to adjacent Iberia Pl. This would provide easy access to the downtown business area of RB and several residential neighborhoods that do not have that access now. For me, the walk or ride would be 1.2 miles, rather than 2.6 mi via dangerous route and 3.0 miles via safer route.

**Biking:** I have recently joined the population that is using bicycles for short trips, as well as recreation. Mine is an e-bike and I can easily do round trips of up to 30 miles, even with the hills in my area. What I can't do is to make these trips in safety. The city and SANDAG are hyping their support for biking to alleviate some of the pollution and congestion caused by motor vehicles. But they can't even maintain the bike paths that we already have. Also, to use bikes for commuting (SANDAG is counting on at least a tripling of biking to work) we need well marked bike lanes and paths that are contiguous. Many of the areas are interrupted by stretches of missing or unmaintained bike lanes. We need more consistent riding paths and much improved driver education and awareness. The recent efforts to use green paint for bike lanes and to add a buffer between the bike lane and car lane need to be expanded as rapidly as possible. Adding a well-marked bike lane at left turns would be a welcome safety addition. I have seen this only at one place, the intersection of Carmel Mountain Rd. and Rancho Carmel Dr (next to Costco).

With 12 deaths to bikers in seven months, more has to be done promote safety. Countless injuries are awaiting bikers that are forced to ride on unmaintained bike lanes, opening up municipalities to large law suites.

**Reducing Carbon:** The RTP aims to reduce GHG emissions, primarily by penalizing travel with cars and trucks. However, as I interpret the plan, the methodology is aimed at generating new income from road usage fees. The plan bemoans the loss of gas tax income from drivers of EVs. Instead of providing incentives for driving EVs, the plan requires that EV owners pay a fee to cover the gas tax losses and then, adding insult to injury, earmarks that revenue for mass transit.

Would it not make more sense to offer payments to gas and diesel car and truck owners to turn in their cars and get them off the road? Couple this with rebates to exchange their petrol cars for EVs.

California registration rates are backwards. The fees should be based on weight and gas mileage, not property value. A Chevy Tahoe produces more wear and GHG than a Porsche 911. But the Porsche owner pays way more for registration. The owner of a BMW K1600 motorcycle pays more than for a Ford Fiesta. The latter weighs more than three times as much and uses twice the gas, but pays less for the registration. EV owners, with vehicles that are emission free and have less aggressive tires should get a break.

This may be extreme, but if you really want to cut GHG you can go to fuel rationing. There is a direct relationship between the fuel burned and the amount of emissions. But this would not work in the face of a model which is designed to generate usage fees, rather than cut emissions. It would also cut revenue from gas taxes. This may be an underlying factor in a model that is designed to generate income from fuel burners while the goal is to reduce the use of fuel. It is more likely to build the fee income than to achieve the stated goal.

## **AUTHOR PROFILE**

I am a mostly retired homeowner in Rancho Bernardo, and spend part of my time as an opinion columnist for the SDUT Community Press, writing under the “Just Sayin” by-line in papers serving the RB, 4S Ranch and Poway communities.

I am active in the community as a volunteer with political, cultural, homeowner and public service organizations, mostly at the board level. These organizations have included the RB Branch Library (hosting concerts), the Poway Symphony Orchestra, the RB Community Foundation, the SDUT Community Press, and the RB Democratic Club.

My career of over six decades focused on project, program and portfolio management, including strategic planning and business development evaluation. As part of this I was frequently engaged to review corporate-level business cases for potential new business ventures. I have published three books and over 300 papers on project and portfolio management and was a pioneer in the emergence of project portfolio management over the past two decades. I served as President and Chair of the Project Management Institute and am a PMI Fellow. As an odd coincidence, long before I became interested in local governance, I was engaged by a San Diego businessman (who I did not know at the time) to conduct seminars in Washington, D.C., demonstrating how traditional project management techniques could be effectively applied in government.

To: Rami Talleh (via [rami.talleh@sdcounty.ca.gov](mailto:rami.talleh@sdcounty.ca.gov))

San Diego County Department of Planning and Development Services (PDS)

Subject: Comments on the San Diego Association of Governments (SANDAG's) Draft 2021 Regional Plan

August 6, 2021

Dear Mr. Talleh,

On July 16, 2021, community planning/sponsor groups were asked to provide their comments on the draft May 2021 San Diego Forward-The 2021 Regional Plan and its thirty-one lengthy and detailed appendices. Although this was an exceptionally limited review period, the Jacumba Sponsor Group has the following comments.

This draft plan identifies interdependent transformative strategies designed to address the greatest transportation and mobility challenges that the region faces: safety and traffic congestion; social inequities; and state and federal requirements to reduce greenhouse gas (GHG) emissions and air pollution—and they are noble goals. However, it makes many unsubstantiated assumptions based on inadequate data from which it then draws conclusions.

On page 10, the plan states that in 2019, greater than 90 percent of CA-MEX trade was moved by truck across the international border. A great fact to know, but where does your regional plan address and mitigate for the smoggy trucks registered in Mexico that are hauling those goods? Will the plan only regulate the emissions of vehicles registered in San Diego County (or California) while out-state and out-of-country (Mexican) vehicles get a “free pass?”

On page 12, the plan states: “from 2016 to 2050, nearly 60 percent of population growth will be among those who are 75 years and older.” Will this aging population (60 percent who are projected to be people of color), feel physically safe while using public transit (buses, trams, trolleys) during evening/night time? Will they all have smart phones and be able to navigate a smart phone application that gives them a choice of transportation modality based on a variety factors including CO<sub>2</sub> emissions?

On page 15, the plan states that if the 2021 plan was implemented, “By 2050, this could result in 13 percent of commuters using transit (up from 3 percent today) and that there would be a substantial decline in commuters driving alone to work (from 80 percent today to 62 percent in 2050). Those figures do not reflect any significant behavioral changes regarding transportation choices given that this plan would greatly expand mass transit frequency and routes. In 2021, many city busses are carrying just two to three passengers while trolleys carry more passengers depending on their routes. How realistic are the 2021 plan's predicted increases? Were urban

residents asked about factors that would actually make them leave their cars and use mass transit instead? Was the current trend of working remotely from home factored into these calculations? What if the public perceives that it is not in their best interests to share a bus or a trolley with a group of strangers who may or may not be healthy? What happens when the next pandemic impacts our region and mass transit shuts down for public safety reasons? Clearly more studies on the current trends in mass transit usage must be analyzed before the predictions contained in this plan can be validated. Also, additional studies on post-COVID mass transit usage figures are critical. Analysts should avoid using the data from any month when all mass transit ridership fares have been waived, as they will skew the data. (This will happen in September 2021.)

On page 25, the 2021 plan calls for providing a variety of transit riders with reduced fares (seniors, low-income, students, youth and the disabled). This is fiscally untenable. What is the actual cost per passenger mile on a bus, trolley, or light rail? **Appendix A predicts that in 2020 dollars, transit fare subsidies in 2035 will be \$982 million dollars and in 2050, subsidies will be \$4 BILLION dollars which means that the answer to the previous question about the cost per passenger mile must be too high to print!!!** This plan cannot seriously contemplate spending \$4 billion dollars to possibly achieve a 13 percent increase in mass transit ridership.

The 2021 plan which seeks to “reimagine” regional transportation strategies appears to be a huge and costly wish list of programs and government regulations directed primarily at changing residents’ driving behavior at a tremendous loss of personal freedoms. It envisions spending millions of dollars to create an expanded bike network with corridors by 2050. Again, where is the data that shows that kind of expenditure will get more people out of their cars and onto bicycles? A recent case in point: the removal of 400 parking spaces along the business district on 30<sup>th</sup> Street in the North Park area so that bike lanes, that are rarely used to commuting to and from work, could be installed. Not only are the merchants upset about the loss of customer parking and business, but delivery trucks are now blocking bike lanes to make their deliveries and handicapped parking has become confusing for those who need it. The 2021 plan will greatly expand on that unpopular and costly transportation strategy.

Under this plan, transportation in and around mobility hubs or areas of concentrated development (cities) would be highly regulated with curb management regulations/fees based on the time of day parking rates, and ride-hailing opportunities. Ride-hailing at mobility hubs is described as offering people on-demand vehicles for short and long-distance trips, possibly subscription-based services which would “allow people to reserve a vehicle that best serves the needs of their trip.” So, it is okay to rent/drive a vehicle but just not to personally own a vehicle?

On page 32, the plan states: “In the San Diego region, almost half of all trips are three miles or less, and most everyday trips are made within neighborhoods using local streets.” Where is the data to back up this statement? This page also states: “On average, one person is killed or seriously injured in traffic violence everyday in the region.” Everyone understands the safety risks that they take when they drive a car and they believe those risks to be acceptable. Again, no

driving statistics are referenced, and of course, the plan does not provide data on the numbers of people who are mugged walking down the region's streets or at trolley stations, etc.

Everyone agrees that climate change is real. On page 34, several climate strategies are listed. The blue pie chart at the top of the page lists "collecting rainwater" as one viable climate mitigation strategy. Why doesn't this 2021 plan identify more impactful strategies such as building new reservoirs/expanding existing ones or building additional desalinization plants? It should be noted, that even if the 2021 plan is implemented, it will not stop the sea levels from rising.

This plan would require employers and developers to provide transportation benefits and on-site amenities to encourage people to use sustainable transportation choices. Does the County want even more businesses to flee California for a friendlier business climate? Employers can figure out how to use flexible work schedules and tele-work options to attract and sustain their workforce without unnecessary government intervention/regulation.

Of course, of the 2021 plan's proposed transportation management "strategies" come at a huge cost (\$163 billion dollars). The plan identifies \$90 billion dollars that will come from local funding sources: sales taxes, impact fees, fuel taxes, roads tolls, increased passenger fares, general funds, housing revenue, ride-hailing fees, value pricing, and road user charges also called vehicle miles travelled (VMT). Road usage fees or VMT, which have yet to be implemented through legislation, are needed to offset the reduction in gasoline taxes as more electric vehicles (EV) use our roadways. Under this plan, VMT fees would come on top of the existing federal, state, and local gasoline taxes, and they would unfairly penalize the drivers of gas-powered vehicles, who frequently are the low-income residents who live in the rural areas of the County. (VMT would not be collected on out-of-state vehicles.) Under the 2021 plan, fees of all kinds would be raised, including variable road tolls based on the time of day (congestion), fees for solo drivers using carpool lanes, and fees for ride-sharing services like Uber. The fees and regulations imposed by this plan will disproportionately impact low-income residents, while the plan claims to promote social equity. They are the ones who will not be able to afford to park/drive their own private vehicles while transportation choices of more affluent residents will not be affected.

Figure 3.3 on page 50 shows the 2021 Regional Plan Expenditures with an estimated total of \$163 billion in 2020 dollars. There needs to be a similar pie chart within the 2021 plan that shows how much money will be spent on each transportation category: Transit Leap (mass transit), mobility hubs, complete corridors, bicycle network, highway improvements etc. Although there may be appendices that list all the funding for a specific category, it is unlikely that most people will wade through all of them to find that important information.

On page 53 of the 2021 Regional plan is a list of a priority implementation actions. Number 1 on the list is "Apply the Social Equity Planning Framework". Number 10 on the list is: "Advance a data science program to better understand travel behavior in the region." These priorities should be reversed. **You can't apply a framework until you have solid, valid, and recent (post COVID) data!**

This very expensive “Lamborghini” transportation plan with its “woke” statements about social equity and its claims to “strengthen a sense of place,” is a direct assault on the personal transportation choices of San Diego County residents. County leaders must choose a less expensive “Toyota” plan that will not transform “America’s Finest City” into a third-rate economy where only the wealthy residents can still afford to drive a car.

Mr. Hasan Ikharata  
SANDAG, Executive Director  
401 B St, Suite 800  
San Diego, CA 92101

**Re: Support incorporating *Reconnect Logan, 5 Freeway Lid Project* in the San Diego Association of Governments' (SANDAG) 2021 Regional Plan**

Dear Mr. Ikharata,

My name is James Brown and I have been a Logan Heights business owner for over 12 years. I am writing to express my support for the incorporation of a project which goal is to address social and economic inequity, rising levels of health concerns aggravated by greenhouse gas emissions, and transportation injustices in San Diego's Barrio Logan and Logan Heights communities. **Specifically, we request the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan (Draft Plan)**

Our once united community was devastated by Interstate 5 which forcibly displaced hundreds in the 1950's and has burdened those who remained. Pursuant to Chapter 1: Equity Focus (p. 11) of Draft Plan, we know *ReConnect Logan Freeway Lid* will transform and reconnect our community. A freeway lid can help our community by dismantling the barriers that the I-5 created by bringing the community together, addressing health concerns by capturing GHG emissions, creating non-existing green spaces, and allowing for development of affordable housing. All goals in line with the Draft Plan of creating efficient movement of people and goods, providing affordable, reliable, and safety mobility options, and allowing for healthier air.

As mentioned, the construction of the I-5 forced many families to be displaced, and while the construction allowed for transportation advancements, since the 1950's our community has been subject to inequality, misrepresentation, and systemic injustices in transportation and racism, to mention a few. We continue to be a working-class neighborhood composed of nearly 90% Mexican Americans, and while our we are proud of our heritage and activism deeply rooted in our National Landmark of Chicano Park, the reality is that I-5 has created much insecurity by facilitating gang turfs, separating families from places of worship, and limiting children's access to neighborhood schools. It is time for our community to heal – a freeway lid is the answer.

Given the significant investment and planning of projects in the Barrio Logan/Logan Heights communities in the Draft Plan as identified in Appendix A: Transportation Projects, Programs, and Phasing, it is appropriate to identify and call out *ReConnect Logan Freeway Lid* as a project on this list. A few of the multiple projects that will impact Barrio Logan/Logan Heights are:

- The creation of Managed Lanes on Interstate 5, Project ID CC002 Complete Corridor: ML/Goods Movement (p. A-8)
- Additional cargo due to the Harbor Drive 2.0 proposal that will facilitate cargo in the community of Barrio Logan, Project ID GM06 Goods Movement: Roadways (p. A-11)
- Harbor Drive Corridor, project ID GM05 2050 Goods Movement: Roadways Harbor Drive Multimodal Corridor Improvements that will facilitate Trucks for the Port of San Diego (p. A-12)

Besides being in line with the 2021 Draft Regional Plan, *ReConnect Logan Freeway Lid* is also pursuant to Appendix H in relation to California Assembly Bill 805 which requires the reduction of pollution exposure in disadvantaged communities. Furthermore, our project is also pursuant to the Sustainable Communities Strategy per California SB 375 since it would help reach the overall goal of reducing GHG emissions of 15% (p. 18 of Draft Plan), as well as allowing for accommodation to the Regional Housing Needs Assessment Determination. For all these reasons, our community is looking forward to **the addition of a Freeway Lid as a priority project as identified in SANDAG's 2021 Draft Regional Plan.**

If you have any questions, you may contact me at [jb@publicdigital.com](mailto:jb@publicdigital.com).

Sincerely,

Re: North County Transit District Feedback and Questions on the Draft 2021  
Regional Plan

Dear Chair Blakespear and Mr. Ikhata:

On behalf of the North County Transit District's (NCTD) Board of Directors (Board), I commend San Diego Association of Governments (SANDAG) staff for advancing the Draft 2021 Regional Plan (Plan). The Plan proposes to push the region forward by enhancing our transportation network through the integration of roads, transit, land use, and technology via the 5 Big Moves.

Given the importance of updating the Plan, I requested NCTD staff review the Plan and prepare recommendations and clarification on behalf of the NCTD Board to submit to SANDAG during the public review period. As you are aware, the region has significant funding needs to complete current TransNet projects that have been promised, but are unfunded, along with the need to support our future through continued investments in our transportation system that meet or exceed statewide environmental, mobility, social equity, and economic goals.

NCTD understands the importance of the Plan as it relates to the development and prioritization of projects for inclusion in a potential future ballot initiative. NCTD acknowledges that the needs of transit and other modes of transportation are vast and that no single initiative will address all the needs. It is within this context that NCTD staff has compiled feedback and requests for clarification to better understand details of the Plan as it relates to NCTD's needs and the

regional transportation system so that the NCTD Board can adopt and submit its recommended priorities to SANDAG.

NCTD staff is requesting that SANDAG provide a response to the feedback and questions posed by July 8, 2021 to support potential discussions at the July and September meetings of the NCTD Board of Directors, to which SANDAG staff will be invited to participate.

On behalf of the NCTD Board, I thank you and SANDAG staff for your willingness to provide responses to the feedback and questions. Feel free to contact me or NCTD's Executive Director, Matthew Tucker, if you have any questions.

Sincerely,

A handwritten signature in blue ink that reads "A. J. Kranz". The signature is stylized and cursive.

Tony Kranz  
NCTD Board Chair

## Attachment A

### NCTD Feedback and Questions Regarding the Draft 2021 Regional Plan

NCTD recognizes the significant amount of data analysis, modeling, and planning that has contributed to the 5 Big Moves and the 2021 Draft Regional Plan (Plan). Based upon the information published on May 28, 2021, NCTD has summarized a series of points below for recommendation, discussion, and clarification.

#### Questions and Clarifications

##### *Regional Capital Project Prioritization and Implementation*

1. NCTD seeks clarity on the status of specific projects that were included in the constrained *TransNet* funding plan but are at risk due to lack of funding. NCTD is seeking information on how much of the estimated \$160 billion proposed plan estimate is allocated to complete these unfunded *TransNet* projects on a project-level basis. NCTD is seeking more detailed information that expands upon the corridor-level information included in Appendix A: Transportation Projects, Programs, and Phasing of the Plan.
2. NCTD seeks clarity on the project phasing proposed within the Plan. Specifically, NCTD is seeking to understand the timing of implementation of unfunded *TransNet* projects related to new projects presented within the Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 1 (Attachment B).
3. NCTD seeks clarity on the assumptions related to the completion of major capital projects, including the assumed percentage level of federal and state match funding required to implement the projects envisioned in the Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 1 (Attachment B).
4. NCTD seeks specific data on the proposed 200 miles of rail service contemplated in the 2021 Draft Regional Plan. To support this, NCTD is requesting that SANDAG input the information requested in Table 3 (Attachment D)

##### *Operational and Financial Assumptions*

1. NCTD seeks specific data on the proposed dedicated source of funding to be used to provide reduced or free fares within the region. NCTD believes that it is important that SANDAG identify a source that is not sales tax based to mitigate impacts to service levels during economic downturns. The source of funding should also match increases in operating costs.
